NOT OUR SCALP.—In reply to quite a number of inquiries in regard to the scalp advertised in the FOREST AND STREAM we beg to state that it has been sold. In fact we had no idea that there existed such an eager demand for scalps in New York. The hair in question was "lifted," (to use the prairie vernacular,) by a very quiet gentleman who will take it to England, where it will pass through the hands of the London anthropological society. Perhaps Sir John Lubbock and some of his associates, having fixed the fact that all the primitive races were man-eaters, will find out that they were scalp-takers, too. We have had the question put to us, "Will an Indian sell a scalp?" We have to reply that the gentle savage, save when drunk, cannot be induced to sell a scalp. Of course, should a brisk inquiry arise for scalps, he might be induced to supply the market in a very indiscriminate way. Low down greasers and Wichita half-breeds will, however, part with these capillary trophies at prices ranging from \$5 to \$15. Scalps are dressed by stretching them in a hoop, scraping the skin and finally smoking. The scalp advertised was remarkable for the length of the hair and the peculiarity of the cut, as it embraced the whole of the hair, with the scalp lock in the middle, and the ears were attached. Taken as a curiosity, this scalp was not a pretty thing to look at, nor adapted even to decorate the front window of the most sensational tonsorial artist on Broadway.

A St. John correspondent sends us the following particulars of Dr. Vail's death:—

Dr. W. E. Vail, the well known New Brunswick marksman, who was one of last year's Wimbledon team from Canada, committed suicide by shooting himself through the head with a Government Snider-Enfield rifle at his office, Sussex, on Thursday evening, 4th instant. He had been drinking quite freely with another young man of the place, and while they were together he placed a cartridge in the arm, took his boot and sock off, laid down on his back, placed the muzzle near his left eye and saying: "I could shoot against any Canadian this way. Say good bye to my friends for me," pulled the trigger with his toe and blew his brains and pieces of the skull about the room. He wished to have been selected for the Wimbledon team of the present year, and as he was not, the matter preying on his mind, is supposed to have caused the rash act.

Truly yours,

S.

THE OPENING DAY AT CREEDMOOR.

THERE is at least this advantage about rifle shooting, that it is no fair weather performance. Great events, such as that of the racing at Jerome Park, may present the by no means agreeable sight of a concourse of people, all with umbrellas up, and of horses spluttering through the mud, but rain or shine the rifleman seeks Creedmoor, and though the day on Saturday last, the 7th of June, was most decidedly a disagreeable one—occasionally foggy, at other times drizzly, with outbursts of a very hot sun at intervals, and notwithstanding the fact that the air was all the time damp, muggy, and oppressive, there was a large and enthusiastic attendance at the range.

Arrangements for the opening match of the season were fairly on time. Perhaps when matters get more smoothly going, directors and range committees will be earlier on the ground, and every preparation will be perfected the day before, so that when the hour for the match is on, the shooting will punctually commence. The rainy morning of Saturday last may perhaps, then, excuse an hour of delay, though if the water did come down in a first class shower, any act of devotion on the part of the excellent directors of the National Rifle Association, as to being soaked when firing, would have set a shining example to all the members. The range was in excellent order, the grass having been neatly mown. In fact, the presence of General Shaler was manifest, who may be said, like an old soldier, to have literally slept on the ground for the last week in order to bring out all the physical advantages of the range. Tents and marquees were pitched, and a howitzer, with artillerymen, were on hand to announce by gun fire the opening and closing of the match. Rain or no rain, the long line across the firing distances was well filled, and here and there were officers of the regulars, General Abbott and staff being on the ground. We regret to mention that there were no ladies, the bad weather having kept them away.

It was eleven o'clock when the Director's Match commenced; 200 yards; position, standing; weapon, any military rifle; rounds, five, two sighting shots. Open to directors and honorary directors of the National Rifle Association. Prize—Gold badge, to be shot for annually, and held by the winner during the year. The score was as follows:—

Name	Rifle	Score	Total
Colonel Wingate.....	New Springfield.....	3 3 3 4 4	17
Lt. Col. Gildersleeve.....	Sharp military.....	2 3 2 2 2	12
General Shaler.....	Sharp military.....	3 2 3 2 2	12
General Sigel.....	Sharp military.....	2 2 2 3 1	11
General McMahon.....	Sharp military.....	3 2 2 2 2	11
Colonel Church.....	New Springfield.....	2 3 2 2 0	9
General Ward.....	Ward Burton.....	2 2 2 0 2	8
Captain Story.....	New Springfield.....	2 2 2 0 0	8
Captain Casey.....	New Springfield.....	0 0 0 2 0	2

This was cleverly won by Colonel Wingate with the new Springfield arm with a score of 17. In our prior number we directed attention to the excellence of this arm. We beg leave to state that the United States Ordnance Department is quite awake to the great progress that is being made in arms, and that their experimenting with various calibres of arms and projectiles is unceasing, and that we believe, as far as barrel and form of rifling are concerned, that the rifle now made for the United States soldier is more accurate than any gun made solely under government supervision in the world. This assertion, we know, is a pretty bold one, but we trust before long to present such data on these subjects as will surprise our readers. Taking into consideration that 15 is a fair average, without calling the score of 17 immense, it is at least quite creditable. It

shows that among the directors of the National Rifle Association, in addition to certain executive abilities, there are some leading marksmen. Rain now came down, which had been threatening, and a long hour and a half was passed before the second match, offered by our most worthy contemporary, *The Turf, Field and Farm*, was in order.

Match 2—*Turf, Field and Farm* Badge; open to members of National Rifle Association; weapon, any breechloader within the rules; distance, 200 yards; position, standing; rounds, five, with two sighting shots; entrance fee, \$1. Prizes—1st. *Turf, Field and Farm* Badge, to be held subject to competition, and \$25 in money presented by the association. 2d. Life membership in National Rifle Association, which may be transferred by the winner if desired. 3d. Cash, \$12. 4th. Cash, \$10. 5th. Cash, \$5. 6th. Cash, \$5. There were sixty-two entries. The scores of the best six were as follows:—

Name	Rifle	Score	Total
G. W. Wingate	New Springfield	3 4 3 3 3	16
E. H. Madison	Ballard	4 4 2 3 3	16
J. T. B. Collins	Remington sporting	4 3 4 3 2	16
P. Klein	Remington sporting	3 3 3 3 3	15
W. H. Richards	Remington sporting	2 3 4 3 3	15
R. F. Hare	Springfield	3 2 4 3 3	15

Do what we may, with our best wishes to give praise when praise is due, under the circumstances, rain or no rain, save a fog, which might have in some way disconcerted the shooters, the scores made with "any breechloader" were not immense. But it will happen so sometimes. It must be remembered that there were some excellent marksmen in the lists, to wit:—Mr. Klein, the winner of ever so many of the German shooting matches, and Mr. Madison and Mr. Collins and Mr. Richards, who are all representative marksmen. Perhaps waiting so long for the match demoralized the men. Colonel Wingate, with his Springfield, score 16, carried off the prize again, making him a twice crowned victor, staggering, in fact, under the weight of his honors. Match No. 3 was now in order; in fact, matches 2 and 3 were somewhat mixed up in the shooting.

Match 3—Military Match; open to members of the National Rifle Association only; distance, 200 yards; weapon, any military rifle. Prizes—1st. Gold badge, presented by National Rifle Association, value, \$50. Life membership National Rifle Association, which can be transferred by the winner if desired. 3d. Cash, \$25. 4th. Cash, \$10. 5th. Cash, \$5. 6th. Cash, \$3. The best six scores were as follows, with fifty-three entries:—

Name	Rifle	Score	Total
B. Burton	Ward-Burton	3 4 3 4 4	17
A. Wood	Remington military	4 4 3 3 2	17
H. B. Smith	Remington military	3 3 3 3 4	16
R. Omand	Remington military	3 3 4 3 3	16
E. H. Sanford	Remington military	3 2 3 4 4	16
J. Trageser	Sharp military	4 3 4 2 3	16

Mr. Bethel Burton, with a score of 17, took the prize, which gave unfeigned pleasure to all the contestants, as it was fully deserved, and we trust that this opening match, in which he was conqueror, will inaugurate a series of victories for him. It will be observed that the apparent tie between Messrs. Burton and Wood was in favor of Mr. Burton, from the fact of his having made no outers. The whole score of the six is fair, and above the average.

Now took place a short interval of time to rearrange the targets, during which the clouds blew away and the sun came out piping hot. At about half past three o'clock the most interesting of the matches took place, being the first stage at the longer ranges.

Match 4—Military Long Range Match; open to members of National Rifle Association only; distance, 500 yards; weapon, any military rifle; rounds, seven, with two sighting shots; entrance fee, \$1. Prizes—1st. Gold badge, presented by National Rifle Association, value \$25. 2d. Life membership National Rifle Association, which may be transferred by the winner if desired. 3d. Cash, \$15. 4th. Cash, \$10. 5th. Cash, \$5. 6th. Cash, \$5. There were fifty-five entries. The eighteen best scores were as follows:—

Name	Rifle	Score	Total
H. A. Gildersleeve	Sharp military	3 4 4 4 4 4 4	27
H. Fulton	Sharp military	4 4 4 4 4 1 3	27
B. Burton	Ward-Burton	3 4 3 4 4 4 4	26
L. M. Ballard	Sharp military	3 4 4 4 3 3 3	21
J. Trageser	Sharp military	3 4 2 4 4 3 3	23
W. S. Smith	Remington military	4 4 4 2 4 2 3	23
F. S. Gardner	Remington military	3 3 3 3 3 4 3	23
Thomas Lloyd	Sharp military	4 4 2 2 4 2 4	23
A. Robertson	Remington military	3 4 4 3 2 3 2	22
A. Wood	Remington military	3 0 4 4 2 4 4	21
L. C. Bruce	Sharp military	3 2 4 4 4 4 0	21
General Shaler	Sharp military	3 4 2 3 4 3 2	21
G. A. Strube	Ward-Burton	3 3 3 4 0 4 4	21
R. Omand	Remington military	2 2 2 4 3 4 3	20
J. P. M. Richards	Sharp military	0 3 3 3 4 3 4	20
R. F. Hare	Springfield	4 3 4 3 0 3 3	20
G. Crouch	Sharp military	3 4 3 3 3 3 0	19
C. M. Yale	Sharp military	0 4 2 4 3 2 3	18

The analysis of the arms in the eighteen best scores shows ten Sharps, five Remingtons, two Ward Burtons, and one Springfield. Col. Gildersleeve's and Mr. H. Fulton's scores of 27, in a possible 28, with Sharp's military rifles, was famous shooting. The 26 made by Ward Burton, with his own gun, was also most commendable. In fact, the total score of the leading eighteen showed fine practice. The figures of the remaining contestants, of course, tapered off to nothing, and whether from having rifles improperly sighted or not, some of our best shots were found having zeros appended to their names. The question may be asked by those not familiar with rifle shooting "how does it happen that the shooting at 500 yards was so much better than at 200?" The answer is in the position. To shoot off hand at 200 yards is to many a harder task than to shoot in any position at 500 yards, that is, the rifleman having the privilege to shoot any way save with an artificial rest.

Pool shooting formed quite an interesting amusement, and quite handsome scores were made; some of the prac-

tice, too, made was quite good. General Dakin, with a Remington Creedmoor rifle, at 500 yards, off hand, made 4 3 3 3 2 3 3 3 4—31, and Mr. A. Alford, with Colonel Wingate's Creedmoor rifle, at 500 yards, scoring 4 4 3 3 4 3 4—25.

To conclude, then, if at the opening match of 200 yards the winning scores were not exactly first class, at 500 yards the shooting was remarkably strong, in fact, wonderfully so, when it is recollected that military rifles were used. Weather changeable, occasionally thick and foggy, with rain, and sunshine about half past two o'clock, cloudy towards the conclusion of the match; wind variable, puffy not strong, from V to III.

The order during the whole match was excellent. If markers were a little slow, it is to be supposed that in time, with more familiarity with their business, they will improve. Occasionally, as it will always happen, some shooters were inclined to discuss the accuracy of the marksmen. It is no common occurrence to find a no doubt truthful person declare that he is on the targets, and a host of friends may be found who are ready to affirm that they heard the ball strike, and that the signal, white, red, or black, not having been displayed, must mean that the marker is either blind or absent. In about 999 cases in a thousand, by carefully adjusting glasses on the target, it is found to have been untouched, and a subsequent shot on the part of the aggrieved person generally ends, when he is watched closely, in discovering that his ball, from an improper sighting of his piece, was lodged safely in the embankment over or under the target. The general rule to be adopted, if not absolutely true in theory, is at least necessary in practice, and that is, that the marker, like a paying cashier in a bank, makes no mistakes. It would, however, be quite well, as we have before observed, to have more glasses on the field. Two or three field glasses are not enough. In an important match, when the whole line is firing, a dozen would not be too many.

On the presentation of the various prizes, General Shaler made a most appropriate speech, particularly felicitating Mr. Ward Burton, who, the speaker said, had worked long and faithfully in developing his arm, and whose excellent shooting entitled him to the prize.

The Remington Diamond Badge Match was postponed, it being six o'clock when the fourth match was concluded. This match will positively take place next Saturday. The regulations in regard to it are as follows:—Open to members of National Rifle Association; any rifle; distance, 500, 800, and 1,000 yards. The twenty making the highest score at 500 yards to compete at 800, and the eight highest at 800 to compete at 1,000. Prizes—1st. The Remington Diamond Badge, to be held subject to competition, and \$25. 2d. Life membership in National Rifle Association which may be transferred by the winner if desired. 3d. Cash, \$10. 4th. Cash, \$5. 5th. Cash, \$5. Time of match, three o'clock. Entries may be made at the office of the association any time before the 13th, or upon the ground on that day.

The regular amateur match on Saturday will be postponed.

We have every reason to congratulate the officers and members of the National Rifle Association on the opening of the season at Creedmoor, as its successful termination may influence future leading events. It will not do for us to say that the coming match in September with the Irish team is a foregone conclusion, and that we are sure to be beaten. To look at it in this disheartening way is to welcome defeat. Now is the time, we say, to commence work. We have fully three months before us, and a fair amount of industry and practice is all that is wanted. We still believe that there are enough good marksmen in the State of New York, not counting what valuable adjuncts may be had from other parts of the country, to make up an excellent team. It behooves us, however, to lose no time. We hope before the 1st of July that the measures proposed by the Amateur club—the process of sifting, as it were—will bring the best men to the front. We think that already some two may be found who certainly, for accuracy, nerve, and staying powers, could be counted on as ready to make the nucleus of our American team, and subsequent matches will certainly develop other talent. It must be recollected that it is the ranges beyond 500 yards which require the greatest practice. In June, 1873, what kind of shooting could the best shots make at 500 yards? The most skillful at that distance were more frequently off the target than at it. We have acquired a great deal in a year, and the arms have been improved, and we are not likely, we fancy, in the next three months to learn dummer, like the famed Dutch soldier. We are by no means in despair about the International match, nor do we suppose that anybody else is.

At a meeting of the executive committee of the Amateur Rifle club, in view of the number of applications for membership, and it having been thought proper to put some limit to the size of the club, it was determined that 150 members in all would make up the complement of the club, and that after that number had joined no more candidates would be eligible save when vacancies occurred. At present the American Rifle club has over 100 members.

There are two large sporting clubs in Syracuse, the Central City and Onondaga, both of them are in a flourishing condition, numerically and financially. A handsome set of silver was shot for by the two clubs last fall, which was won by the Central City, they making the handsome score of 86 out of 100 birds to 84 by their opponents.

THE ILLINOIS STATE SPORTSMAN'S CONVENTION.

[BY OUR SPECIAL CORRESPONDENT.]

THE Illinois State Sportsman's Association held their first annual meeting under the auspices of the Prairie Shooting club of Chicago, at Dexter Park, Chicago, Illinois, on June 3d. On the previous evening a meeting was held at the Tremont House, when the president of the convention, Mr. Le Moyne, called the meeting to order, and explained in plain, practical language the objects of the association. Among other facts and truths he stated that "game and fish are rapidly disappearing from the State of Illinois, perhaps not to that extent which would interfere with the field sportsman and angler of the present generation, but he would impress upon the gentlemen present to use their utmost endeavors in the protection of game and fish, especially in the breeding and spawning season." Mr. Le Moyne continued, and among other remarks stated what they should do is to stop the sale of game and fish out of season. Between killing and selling they should, as members of the association, strive to stop the latter, as that would virtually stop the other. A material objection to the present law is the allowing of parties to sell what birds are on hand when the shooting season is over. Every one knew how impossible it was to tell whether the birds thus sold were killed in or out of the season. The law should be modified so that it would be unlawful to have birds in one's possession after the shooting season terminates. Upon this point he did not look for opposition from the dealers. They understood very well that the wholesale slaughter, as at present indulged in, will soon exterminate the game, and thus an important branch of business be forever ended. But the real delinquents, said the speaker, are those snobbish persons who are willing to pay out money to put upon their table game and fish at all times of the year. For these things hotel keepers and other caterers are much to blame.

The following were among the prominent sportsmen who attended the meeting:—W. F. Milligan, Esq., Gen. J. D. Webster, Joseph Butler, D. T. Elston, W. T. Johnson, S. H. Turrill, George Sherman, Abner Price, R. R. Clark, N. Doxey of Geneseo, Dr. W. A. Pratt of Elgin, Gen. W. E. Strong, E. O. Dow, F. J. Abbey, H. H. Gray of Syracuse, N. Y., H. B. Sherman of Beloit, Wis.,

The convention now proceeded to business, and the following gentlemen were elected to serve as officers during the ensuing year:—President—John V. Le Moyne, Chicago; Vice President—J. L. Pratt, Syracuse; Second Vice President—Nathan Doxie, Geneseo; Treasurer—Abner Price, Chicago.

The following prizes were presented and accepted by the convention. First prize, the gold medal of the association to be shot for by members only. Second prize will be a beautiful fishing rod and tackle presented by F. J. Abbey. Mr. H. Holabird presented a complete shooting suit, and the popular Mr. Joseph Butler of Chicago, gave an elegant split bamboo fishing rod and tackle.

The shooting commenced June 3d, but the weather was anything but desirable for showing good scores. The rules for the tournament are, that the birds are to be shot from H & T plunge traps, 21 yards rise for singles, at 10 birds each 18 yards rise, for doubles at 5 pair each. The sportsman killing the most birds in the aggregate of both rises to be the winner. The following are the scores by squads for the gold medal.

the gold medal.

FIRST SQUAD.

Mr. Bruce Wilcox having killed all his single and double birds was awarded the gold medal of the association. The second prize was won by J. J. Kleinman, there being three ties each gentleman having killed 19 birds. The third prize was allowed to Mr. Miller, Mr. Fitch being unwell. The fourth prize was won by Mr. Edwards which was a surprise as so many good men were entered against him. Capt. Bogardus referee.

On June 5th the Gold Medal Badge of Club Championship was shot for at 10 single wild pigeons, from plunge traps, 21 yards rise and 80 boundary, and five double rises, 18 yards and 100 boundary. The weather all through was very variable, and interfered a good deal with the birds and shooters. The following is the score:—

Name	Club	Single Straight	Killed	Double Straight	Killed
Abner Price.....	Kennicott, Chicago.....	5	9	5	10
J. J. Kleinman.....	"	5	9	5	10

P. H. Blaisdell.....	"	8	7	5	9

Referee—Captain Bogardus; scorers—J. G. True, FOREST AND STREAM

The Gun club was declared winner of the first prize, and for a new organization, where there were so many real good shooters, it is indeed an honor to have carried off the two principal prizes. They were, with one exception, as cool and collected at all stages of the trial as one could expect or wish.

Several prizes of powder, presented by Laffin & Rand, was awarded to the Kennicott club, one of the oldest organizations of the kind in the west, and numbering among its members some of Chicago's oldest inhabitants, and many whose record "in the field" is far above par. I enclose a copy of their constitution and by-laws, which speaks for them.

The third on the list stands the Geneseo club, strong in every particular, and but for their "anxiety to win" I doubt not a better score would have been made, although they do not complain of their record. It was hard to excel by any whose experience has not been greater than most of their squad have had.

The Prairie club were not up to their usual standard, and more of their members were "off" than in any other squad, still their score throughout the tournament was one of the best. They are the oldest club in the city.

Taking the scores from the beginning, where will you find such an average, or be able to select from the same number of men so many strong shooters that can make such a record? It would be hard to find them. The birds were wild, strong, and healthy, and in most cases required quick work, the wind assisting them part of the time. It has proved one of the most successful tournaments ever held here, and will prove of immense benefit to all concerned. If one is held next year it will prove as good as any in the country, and well worth the attention of some eastern men. It has partly been the cause of waking them up in regard to the preservation and protection of game and fish (see copy of resolutions sent last night), to be strictly enforced by all members of the organization throughout the State. It will not be said of Illinois that "they are driven out," and most members present during this week will be glad to acknowledge that they did see this fact at last. You can take some of the western States now, and parties are being made up to go west into Iowa, Kansas, and Nebraska for a good hunt. They have done so for some years, Illinois not excepted, and all because the game was simply slaughtered in and out of season. It may be sport to say "I killed so many in one day, week, or month," but a true sportsman does not often kill so many that they cannot be even shipped or cooked. Look out for Iowa next, and as the west is being more rapidly settled than any other part of the country the only place the poor birds can find will be—"where?" If they all had read of Mr.

Newell's (whom I met in Detroit) work on hunting moose, indeed they would pass laws and enforce them.

There are to be some sweepstakes to-morrow, and part of the day will be given to them. Will forward report. I understand some private shooting matches have also been made—one by Capt. Bogardus and one by N. Doxey.

JUNE 6th.—Sun shining, and cool wind blowing from southwest, making the best day for shooting during the week. Not as many present as were expected, and sweepstakes not as exciting as they had hoped for. Matches will be made, if possible, by Mr. Bogardus, but so far all seem anxious to let him alone. The gun trial is progressing finely, and giving entire satisfaction. The test has been one almost entirely new to most makers here, and would have been much better if understood. The following are the entries for the gun trial. Will send report as soon as made up:—

OWNER.	MAKER.
1—R. R. Clark.	F. J. Abbey.
2—W. F. Milligan.	Foster & Abbey.
3—W. F. Milligan.	J. P. Butler.
4—W. F. Milligan.	J. O'Connell & Son, London.
5—J. V. Le Moyne.	George F. Abbey.
6—J. V. Le Moyne.	O. P. Secor.
7—D. F. Ellston.	F. J. Abbey & Co.
8—J. L. Stocton.	Scott, J. B. & Co.
9—Abner Price.	George T. Abbey.
10—R. R. Clark.	Joe Marton.
11—R. R. Clark.	Egg, London.
12—E. T. Martin.	F. J. Abbey & Co.
13—Joseph Butler. (2)	George T. Abbey & Co.
14—P. A. Howe. (2)	W. W. Greener.
15—F. J. Abbey (5)	W. W. Greener.

I enclose photograph of medal belonging to the Gun club, to be shot for some time next week, presented to me by Mr. S. H. Turrill. Have been promised one of the badge won to-day, also one by Mr. Wilcox. As soon as received will forward. J. G. TRUE.

The Kennel.

BENCH SHOW OF DOGS AT THE ILLINOIS STATE TOURNAMENT.

[BY OUR SPECIAL CORRESPONDENT.]

CHICAGO, Ill., June, 1874.

I BELIEVE this is the first public show of sportsmen's dogs held by the authority of any recognized club in the country. The weather was unfavorable, and militated considerably against the judging of the animals.

SETTERS.

No. 1.—C. F. Frizill.—Five pairs red Irish setters, good size and style, fairly broken.

2.—T. G. Kaye.—Two very fine setter pups, 8 months old, remarkable for size and intelligence. For dogs of the same age and under, the committee think this pair of pups entitled to the highest credit of any represented.

3.—J. H. Whitman.—Good size and appearance, evidently a fine pair of dogs, but the committee had no opportunity to test their action.

No. 4.—J. H. Whitman.—Large, light setter, very fat, great depth of chest, and fine head, well broken, and evidently one of the best dogs to breed from on the ground, and of immense power and good action.

No. 5.—J. H. Whitman.—The committee, among so many well appearing dogs, find it hard to make an award, but incline to the opinion that this pair of animals are entitled to the highest mark of credit as the best pair of setters exhibited.

No. 6.—H. D. Edwards.—Medium size and style, probably the best broken pair of dogs on the ground; owner entitled to great credit for breaking.

No. 7.—H. D. Edwards.—A very handsome dog, well bred, and like the others, well broken.

No. 8.—C. T. Pitkin.—A well bred and handsome pair of pointer pups.

No. 9.—J. F. Lawrence.—Very handsome puppies, showing excellent blood.

No. 10.—H. Batty.—Large coarse dog, without pedigree or training, showing large bone and muscle.

No. 11.—M. Mahoney.—For style and action cannot be too highly complimented; middling in size and good appearance; best bitch on the ground.

Mr. Le Moyne, Prest., had some rattling fine dogs.

The Chicago Times, in giving a description of the dogs, says:

The bench show of dogs was one of the finest ever given in this country. While there were not so very many exhibited, it was evident to every one that some if not the best hunting canines in the State were present. Among the number were noted some thoroughbreds and several imported dogs and bitches. Mr. H. J. Edwards, of No. 332 Lake street, made probably the best show in this line. His show consisted of Spot, a thoroughbred Laverack dog, five years of age, of a lemon and white color, and imported by Maj. Foster, of Quebec; also Dan, a lemon and white setter, three years old, out of a full-blooded bitch; also Irish Dan, three years old, and bred by Kenosha, a Wisconsin gentleman. The two first mentioned are in all probability as good as any setters in this country, and Mr. Edwards stands ready to match them to hunt woodcock, in the month of July, for any sum of money. Address this office. Mr. J. V. Le Moyne's display of dogs was also a fine one. He showed a large red and white setter dog named Juan, which was imported in 1873; a black and tan bitch, a pure Laverack, named May, imported in 1873, and got by Sam, and English prize-winner of some note across the big pond; a red and white setter dog, Don, out of a bitch owned by John Link; he is considered one of the best hunting dogs in the country; a white setter named York, of a stock imported some time ago; a full-blooded Gordon setter out of Belle; also a black and tan bitch named Nellie. Mr. C. F. Brezell showed a brother and

sister named Random and Dollie, got by Don, each 23 months old, which are very fine. John Farnsworth showed a pair of pointers purchased by him at the late Lord Parker sale. Two other pointers, Tom and Jenny, were shown by Mr. C. Pitkins. They were got by R. R. Clark's pointer Spot out of Crosby's bitch, and are very well bred.

Our correspondent continues and criticises:

The committee having no scale of merit to go by, and but little opportunity to judge of the style and action of the various entries, and being interrupted by the storm, do not consider the above a fair display or satisfactory examination. They desire to state that they consider the entries that were made very satisfactory, and hope for a much larger display at some future meeting of the Association. In closing the report, the committee take occasion to say, they consider this a most important branch of any meeting of this nature, and hope that the Association at its future meetings will offer prizes and give every possible encouragement to such an exhibition. The great West was the first to give it prominence, and in this respect commensurate to its preeminence in all other amusements of the field sportsmen.

L. B. CROOKER,
JNO. DAVIDSON,
H. N. SHERMAN, } Committee.

—The following notes on Mr. Edwards' dogs were taken by me while on a visit to his kennel: "Sport," 5 years old past, was imported by Maj. Foster, of Quebec, Canada, and was bred by a gentleman in England, and is a pure Laverack setter, and the dog that Mr. Edwards offered to match some years ago against any one in the United States for \$250 or \$500. Since which "Spot" had his leg broken, and is now kept solely for stock purposes, and can always be found in Chicago at Mr. Edwards' place, 362 West Lake street. "Dan," 3 years old, lemon and white; large and fine size, out of Dr. Drimmond's red Irish bitch, now dead, brought from Canada, and was very fine, and by "Spot" is thoroughly broken. Red Irish setter "Dan," bred by H. Miller of Kenosha, Wis., out of a sister to lemon and white "Dan" by Miller's old "Spot," formerly G. T. Abbey's old stock; fine and nice looking, and partially broken; one year's work only. Mr. Edwards takes great interest in dogs, and many of the good ones out here are from his stock. Has a bitch he brought from New York, said to be very fine, but the pups have proven gun shy, so he could not do anything with them.

J. G. TRUE.

THE MARYLAND DOG LAW.—The recent law as regards dogs, passed by the Legislature of the State of Maryland is a step in the proper direction. What is the utility, or what good can be made of the countless mongrels one sees in every city, town, village, and hamlet throughout the Union? If a person keeps and feeds a dog he generally does it for some special purpose, either as a watch dog, a pet, or to add to his amusement in the sporting field. We are sure that the parties owning these animals are willing to pay some small annual tax, so that the dog may be protected by the law, and have some kind of a value placed on him. We quote the portions of the law which will be likely to interest our readers:—

Section 1. *Be it enacted by the General Assembly of Maryland,* That the boards of county commissioners in the several counties of this State are hereby empowered and directed to provide for the annual taxation of all dogs therein at a rate of not less than one dollar for each dog and two dollars for each bitch: Provided, That the tax in Talbot county and Harford county shall be one dollar on either dogs or bitches.

Section 2. *And be it enacted,* That the county commissioners of the respective counties of the State, shall, and they are hereby directed to divide their counties into constabulary districts in accordance with the number of constables in each of said counties, and shall make it the duty of said constables in each of said districts to annually enumerate and assess, at a rate prescribed by said boards of county commissioners, of not less than one dollar for each dog and two dollars for each bitch in said districts, and collect the tax levied upon the same, and pay the amount received by said collection into the county treasury, at such times as may be fixed upon by the said boards of county commissioners, and the official bond of any of said constables failing to account and make returns as aforesaid shall be held liable for such default, and all constables who shall faithfully account as herein required, may retain a commission of twenty-five per cent. on the amount actually collected and paid into the county treasury, and the net amount of such taxes, after payment of all charges, shall be applied to the credit of the school fund of the respective counties of the State: Provided, however, That every householder, either owner or renter, shall be entitled to keep one male dog free of taxation; but only one dog, however, shall be thus kept free of taxation in or about any house, irrespective of the number of families occupying the same.

POINTER AND SETTER CROSS.—J. H. Walsh, Esq., editor of the London *Field*, in response to an inquiry of ours relative to the cross of the pointer and setter and the breeding again of their progeny, writes as follows:—

"I have known many good Droppers, (i. e. the first cross between pointer and setter,) but never a good one of the second cross, and this is the general belief here."

This second cross shows either pure pointer or pure setter while the first is generally half and half, or nearly so.

NEW YORK, June 6, 1874.

EDITOR FOREST AND STREAM:—

Some interesting comments on hydrophobia, which appeared in FOREST AND STREAM recently, brought to my mind a cure for the disease vouched for by a distinguished French physician, Dr. Buisson. He says he never knew of a case to fail of recovery where the patient was repeatedly placed in steam baths varying in heat from 57 to 63 degrees centigrade.

WAYNE HOVEY.

[We printed this some time ago.—Ed.]

HYDROPHOBIA.

WASHINGTON, D. C., June 5, 1874.

EDITOR FOREST AND STREAM:—

I see by the copy of your paper, of June 4th, that under the heading, "Hydrophobia," you allude to the fact that *Land and Water* has copied an article of mine on that subject and state the treatment which I employ, viz.: "Probing the wound thoroughly, treating with nitrate of silver, and poulticing." This is a mistake, as you will see by referring to your issue of April 16th. In the article in question I recommend the following plan, and see no reason as yet to modify my opinion: The bitten parts should be carefully excised, (cut out,) if not involving blood vessels, carefully washed with warm water and fuming nitric acid applied for two days in succession. I do not mean constantly for two days, but simply two applications made. I condemn emphatically the application of nitrate of silver or lunar caustic for the reason already stated by one of our most eminent surgeons, Professor Joseph Pancoast, "that this salt decomposes too rapidly in contact with animal tissue to make a deep and penetrating impression. Fermented poultices should be used for a number of days after the acid is applied. In cases where the bites are deep seated they should be washed out with a small sponge, containing warm water and ammonia, or a solution of chloride of zinc, after which the acid may be applied. Believing this explanation a sufficient excuse for its length owing to the great importance to all of us of this subject,

I am very truly yours, H. C. YARROW.

DISFIGURING OF SETTERS BY TAILING.

EDITOR FOREST AND STREAM:—

How often we see beautifully formed and gracefully actioned setters totally disfigured by the cutting of their tails? Nothing adds more to the beauty of a dog's movement than that vigorous lashing of the tail, as he ranges in advance of his master, and a setter can become as rigid in this portion of the body when on a stand, be it cropped or not.

It has lately come to my knowledge that an ardent sportsman, and withal a capital fellow, who had imported two very fine Macdonald setters at a great expense, cut the tail of one of them, the beautiful flag of a handsome setter. Alas! why did nature give the poor thing a tail to be cut off? Our medical sportsman would have as soon cut the tresses of a beautiful lady as to have deprived the setter of her ornament. I fear the cropping has been done at too great an age, and a square stump, blunt and clumsy, will be the result. I fancy I can see Kirby's canine friends and admirers in caucus, vowing vengeance, for Kirby is worthy of admiration, and is no doubt the finest one of bred bitches in America to-day. Ah! Doctor, a fatal mistake; seek the lost portion of the tail and splice it. I have heard of the wonderful performance of your new dogs on snipe, at Troy. Truly you have a pair of gems. "Homo."

Shot Gun and Rifle.

JUNE IS A CLOSE MONTH FOR GAME.

Details of pigeon shooting and scores of rifle matches, and other interesting matter, should be mailed so as to reach this office on Tuesday morning in each week.

The following letter from the "Game and Inland Fishery Protection Society" of Nova Scotia, has lain upon our table for several days, together with the enclosure to which it refers. The letter containing the rejoinder to Mr. Whitcher's communication to us will occupy a column and a half of FOREST AND STREAM, but we shall print it next week, that both sides may have a hearing, lest we be charged with unfair partiality. No doubt the society recently organized is in earnest in its purposes to protect the game and fish of Nova Scotia, as are the present constituted officers appointed by the Dominion Government, and we feel that a combination of efforts will accomplish increased good. But the real question at issue, as we view it, with some personal knowledge of its merits, is whether the Province shall control its own fisheries, etc., or whether the General Government shall do it. In the former event is involved the removal of Mr. Venning, who is at present Inspector both of Nova Scotia and New Brunswick, and the appointment of a special officer for Nova Scotia alone. Some personal as well as political feeling enters into its composition; but as we are not recognized as the mouth-piece of the Canadians, it does not become us to enter into the controversy further than to insist that whatever results shall inure to the success of the avowed object in view, which is the protection of the game and fish.

HALIFAX, N. S., May 25, 1874.

EDITOR FOREST AND STREAM:—

Sir: I inclose you a letter which appeared in this day's issue of the *Morning Chronicle*, of this city, in reply to one from the pen of W. F. Whitcher, Esq., Deputy Minister Marine and Fisheries, which originally appeared in your paper, and have to request the favor of your inserting it.

I agree with you that the work of a Fishery Commissioner and his deputies, when properly performed, is arduous and laborious, and I do not think he should be annoyed by unnecessary complaints of a general character; but that is no reason why well grounded charges of neglect and inefficiency should not be investigated, and remedies suggested by those acquainted with the circumstances should not be applied.

I have endeavored to put the case of the present state of the Nova Scotian rivers before the public as strongly as possible consistent with the facts, and I can assure you that the picture is not overdrawn. I wish you could spare time from your editorial labors to take a run down here, and you would see for yourself the state of affairs, and then I think you would not be so ready to endorse the sneering allusions of the Deputy Minister of Marine and Fisheries to the attempts of our society to remedy a serious public grievance.

I have been waiting until our new game laws were out of the hands of the printer, to send you a copy, together with our bye-laws and constitution, which I shall be able to do in a few days.

I shall be happy at all times to furnish you with any information respecting our game animals or birds, which I think will interest your readers. I am, yours truly,

FITZ. COCHRAN,

Secretary Game and Inland Fishery P. Society.

—Some time since a bill was presented in the House of Representatives, the object of which was to restrict the killing of bison or buffalo on the plains. What became of this humane measure we have not been able to ascertain.—*Bergh's Animal Kingdom.*

[See FOREST AND STREAM, page 184, No. 12, Vol. 2].

—We have received a very good target, made by a member of the New Orleans Rifle Club. The target is 19½ inches in diameter and made up of concentric rings one-half inch in width. The bullseye is 5½ inches in diameter, (white,) surrounded by a black ring 13½ inches in diameter, then follows the white rings to make up the total diameter. Each shot counts from 20 in the centre, diminishing by one to the circumference. Total made by the riflemen, 554. The distance was 605 feet. The weight of the rifle was 17½ pounds, muzzle loader, with patent muzzle, and all the 50 shots were fired in 63 minutes, the shooter measuring each charge of powder from a canister, loading and wiping out rifle after each discharge, and having to walk a distance of ten feet to a loading table and ten feet back to the firing point. This shooting, then, is very fair, under the circumstances, as the firing must have been rapid, taking into consideration the time necessary to walk some 1,000 feet or more, and to load, clean, aim and discharge the piece.

ARRANGING A RIFLE TEAM.

The following contribution from a distinguished Canadian rifleman will be found of great interest, and doubtless Colonel Wingate, or whoever has the American team in charge, will study this most important matter—of arranging the men to the best advantage.

EDITOR FOREST AND STREAM:—

Noticing your numerous contributions on Rifle Shooting, in the interest of the noble science I venture to contribute my mite, not as to shooting, but to placing the men in a team. Many men who shoot in matches are not aware how much depends on men being well placed. I for many years had much to do with rifle shooting, especially team shooting, and venture to offer a few suggestions for the benefit of the eight or six who are to shoot against the Irish team. Let your team elect their steadiest shot and the man in whom they have most confidence, leader. Let him always fire first and be a sort of pilot. Make him register the difference in elevation and windage of all the rifles in his team, so as at once, when he has hit the target, and is confident of having been steady when he fired he can put the man following him on the bullseye. Place a thoroughly reliable man next him, so that if by any accident the leader misses, the second man may do his duty. Keep the *oldest and coolest* shot for last, and second to last another good man, putting the less certain men in the middle. Many a match have I won by placing my men thus, and often have I seen matches lost by putting nervous men at the tail end of a squad. Unsteady men are often much steadied by having confidence in the man behind them. I had the pleasure of taking Colonel Wingate over our ranges some two years ago, and I have no doubt he remembers some of the shooting at 1,000 yards, made, if I remember rightly, by Shunar of Melbourne. Your men have their work cut out to beat the Irish team, and unless they kill them with kindness I fear they can scarcely do it. Hoping the match will be a close one and that the best men will win, I am, yours faithfully,

ROYAL.

PIGEON AND RABBIT SHOOTING IN PARIS, FRANCE.

St. Louis, May 25, 1874.

EDITOR FOREST AND STREAM:—

The Tir of Gastine Rennett, near the Bois de Boulogne (1851) was the fashionable resort of the *creme de la creme* of that most creamy place, Paris. There, during the *belle saison* (autumn), the crack shots congregated and shot for prizes. It may be interesting to your many readers to know how it was done, and may point out a plan of getting up a shooting ground for that kind of sport somewhat in advance of our primitive way.

At the Tir, not only was prize shooting carried on, but at other times practice was afforded youngsters under the instruction of a teacher how to shoot on the wing or on the run. The grounds, probably five or ten acres in extent, were enclosed by a high stone wall. Near the entrance, midway on the ground, was erected a neat pagoda sort of building fifteen by twenty feet, the front open. In this building were racks for guns, a loading table, (muzzle-loaders only were used then) in the rear a refreshment table, presided over by a *dame de comptoir*, who also attended the financial department, and during the firing kept the score, having for that purpose a seat sufficiently elevated to overlook the field. On the racks were guns of the best French and English makers, for the use of which the ammunition, birds, or rabbits, and the loading by an expert, always there for that purpose, a certain amount was paid. At the opposite end to the pagoda, to the right hand corner of the enclosure, were large dove cotes surmounted by large wire cages, and on top of these smaller trap cages to which the birds that escaped from the shooters generally flew and were thus secured.

In front of the pagoda were seats for the company and shooters. A paved walk about twenty feet long led to the firing stand, at intervals were stations marked for handicapping, the regulation distance 21 metres. Five ground traps were used, five metres apart. Upon the shooter's name being called, the puller handed him a bag in which were five small balls numbered from 1 to 5, from which he took one or two, single or double birds. These balls were handed to the puller without inspection from the shooter. The strings from the traps were also numbered from 1 to 5. As the puller was located some distance behind the shooter he had no knowledge of the trap to be sprung. Under the traps was what might be called an arched cellar for the use of the trappers and cages of live birds. The traps were handled and the birds placed in them from under, consequently the trappers and birds were out of sight and out of the way, and no time lost in furnishing the birds. In single bird shooting both barrels were allowed; if a miss with the first a kill with the second counted fair.

For rabbit shooting there were several openings or burrows from the surface leading to a common center in the underground chamber, from which bunny was started at the tap of the bell from the puller. I confess it was jolly fun to see the cotton tails popping out of the ground, one or two at a time, and see how easy it was to miss them, and the excitement of our French cousins thereupon. The marksmanship, considering the distance, was generally good, and on some occasions I have seen 24 out of 25 birds killed.

PERDRIX.

DETROIT, June 4, 1874.

EDITOR FOREST AND STREAM:—

I enclose you herewith score of a little sweep shot, June 1, under the following rules:—30 yards rise, 80 yards boundary, ground traps, 20 birds each, \$20 entrance, divided in two prizes.

Fisher.....011001011010	Long.....00011111111
11110111.....13	11110111.....16
Eldridge.....011000011011	Gilman.....101011011111
1111000.....11	01111100.....14
Canniff.....111111011000	Hinsdale.....11010111001
10101011.....14	01111111.....14
First prize taken by J. E. Long. Ties shot off at 3 birds same distance.	
Canniff.....101—2	Hinsdale.....111—3
Gilman.....111—3	
Second tie shot off same distance, first miss out.	
Gilman.....0	Hinsdale.....1
Hinsdale winner second prize.	J. E. L.

[We are not aware that any member of any recognized club in this country or abroad has ever equalled the above shooting; distance, 80 yards rise, from ground traps, 20 birds each, Mr. Jno. E. Long killing 12 straight birds in succession, and in all 16 out of 20. We should like to hear if this shooting has ever been excelled.—ED.]

Sea and River Fishing.

FISH IN SEASON IN JUNE.

Salmon, <i>Salmo Salar</i> .	Salmon trout, <i>Salmo confinis</i> .
Trout, <i>Salmo fontinalis</i> .	Shad, <i>Alosa</i> .
Land-locked Salmon, <i>Salmo gloveri</i> .	Michigan Grayling, <i>Thymallus tricolen</i> .
Black Bass, <i>micropterus salmoides</i> .	<i>micropterus nigricans</i> .
Striped Bass, <i>Roccus lineatus</i> .	Sea trout, <i>Salmo immaculatus</i> .
Bluefish, <i>temnodon saltator</i> .	Weakfish.

—The treasures of the deep are displayed on Fulton market slabs this week in wonderful profusion. Sheep-head, which have been coming from the southward hitherto, put in for Long Island on Tuesday last, and 1,000 pounds were caught in the vicinity of Babylon, some of them eight pounders. Sheepheads at this time of the year generally bring 30 cents a pound, but are now selling at 20 cents. Blue fish are being caught most everywhere, and are running up to a handsome weight of eight to ten pounds—which is big for the early fish. In August they will turn the scale at 14 pounds. Spanish mackerel are coming in splendid order from Norfolk; where the catch us to quality and quantity never has been better. They are worth some 35 cents a pound. As they work up further North they will improve. The usual weight is about two pounds. They may be expected in our latitude about the close of this month—perhaps sooner, if the warm weather only holds. Striped bass, the fisherman's delight, are here; no secret about the locality. The fishermen who fish for a living, are catching them and sending them in from off the coast of Rhode Island. May be a line thrown in somewhere off the rocky coast from Westerly to Newport, and properly addressed, would be responded to, by a noble fellow; for what we saw in Fulton market, just from the Sound steamer, weighed from 5 pounds up to 35 pounds. It is quite likely that the striped bass will be in abundance this year. Shad have presented themselves in excellent quantity this year, and of fine flavor; they are now on the wane, coming chiefly from the Connecticut river. Mackerel are abundant, and of better quality than were last reported, and we hear they are now going straight to their more extreme Northern grounds. Weak fish (*squeteague*) are so plenty, from Long Island, and New Jersey—as to be had almost for the asking.

Now, it is extremely hard on the crab, generally an exceedingly aggressive and hard fellow, that he should be obliged to put on his soft shell, and make himself the most harmless of creatures, and the most delicate of morsels to eat, all for a beggarly \$1 a dozen, when he ought to fetch at least \$1.50 to \$2. But so it is. The soft crabs are coming from Chesapeake Bay and from Squan River *en masse*. Of baby lobsters from Maine there are less on the market. Some noble blue backs from Cape Cod, 8 and 10 pounders, with claws large and strong enough to grapple up the submarine cable, are on the fish stands. Green turtle are plenty too, coming from Indian River, and an alderman could gorge himself with fat turtle at 18 cents a pound. We cannot fall back on that novel phrase, "we told you so," in regard to salmon. We thought they would be much cheaper, but alas! they are not. The king of the fish is slow—decidedly slow—this year, and refuses to be cut up into steaks at less than 45 to 50 cents a pound. Next week, however, we live in hope of his being "three shilling," and in July he must be 25 cents, or how could the gents at Saratoga exist? Some fine salmon are coming from the Miramichi. A good many handsome fish, not very large, 7 to 10 pounds, are arriving from the Penobscot. We can add the plural *s* this time to Pompino, as we saw four of them on Mr. Blackford's stand on Wednesday. There is no doubt the range of the fish is more northerly than was thought, and the reason why they are caught is that fishermen now know what a delicacy they are. More moon fish have put in an appearance, and with them a curious kind of a fish—the crab eater—*De Kay's Elacate Atlantica*, some two or three specimens of which we saw. We were delighted, too, to notice a noble gar, some three feet and a half long. We have his head now before us, and though his long jaws are covered with teeth, and not exactly pretty to look at, their mechanism is beautiful. Both upper and lower jaws work. The lower jaw has undoubtedly a voluntary motion, the upper an involuntary one. A beautiful cam on the upper jaw fits into the lower one. The upper one being hinged when the lower one is thrown down, the upper one moves. The jaws of a gar fish may be lovely to look at on our desk, but must be very hard on the fish he catches in the water.

—Here is a note from Dr. Kenworthy, Barnegat, dated June 6th:—

"Have been here for two days. Strange to say, large blue fish have not entered the bay. First time they have missed. Thursday caught 68 small blue fish weighing 170 lbs. The day after took 71 weighing 183 lbs. Fishing very poor."

We should call this *very fair* fishing.

—A nice little salmon, fourteen inches long, supposing that the fishway at Augusta dam, in the Kennebec, was already built—as it ought to have been long ago—tried to get through last Saturday week, but not succeeding was caught by an Augusta fisherman, on a hook baited for perch. Old fishermen say this is the first instance on record of river salmon taking bait, and it is a curiosity on that account.

—Several young salmon have been seined off the mouth of the Merrimack, in Mass., recently.

—A letter from Maine says that "the ice did not move out of the Rangely Lakes until the 29th of May. The logs will have three weeks to run through from the upper lake, after which there will be fine fishing, although we have

just caught, between the logs, in the lake, a five and a six pound trout; but the small trout don't take hold yet."

—Anglers at the Grand Lake Stream, in Maine, are having uncommon good sport this spring catching land-locked salmon. Messrs. Rowe and brother, and Walter S. Barnes, of Boston, have been giving them a "try," and Mr. Rowe writes to a friend:—

Mr. Barnes and myself caught yesterday, (June 1st,) with the fly 105, we not fishing more than five or six hours in the day. Many were taken in pairs. The slaughter of leaders and flies was great for a time. The run of salmon this spring is quite beyond our anglers' most ardent and sanguine expectations, and 'tis a wonder how they hold out under such drafts. I think it safe to say that over 500 pounds were taken out of the stream and outlet yesterday. Long may the lordly salmon, (certainly monarch here,) swim, and make his home in Grand Lake Stream, and may his appetite for well tied flies never fail him when I have the good fortune to cater to his delicate taste.

Mr. R. never kills more than he can use, and most of the 105 were packed on ice and sent in care of one of the party to many of his Boston friends, our Boston correspondent being among the fortunate recipients.

—A second effort by expert anglers last week at the Little Falls of the Potomac, could not induce the shad to rise at the fly, although the river was lower and the water clearer. From the Housatonic we have quite a different account, as we learn from the Hartford Times that two gentlemen in Derby hooked eleven a week ago in a single day and secured six of them. The fish were represented as being very gamey, and it took forty-two minutes to land one of them. A friend at Hartford, who is on the *qui vive* for shad anglers, writes June 4th:—

Have not heard of any one's taking any shad on Connecticut River with fly this season, the river has been so high and muddy. Trout fishing has been very good in this vicinity, and also in Massachusetts; have seen several good baskets.

Yours for fish,

F. BOLLES.

—Another Hartford correspondent writes June 6th:—

The Connecticut River has been so thick and swollen until this week that fly fishing has been impossible; and though not yet in good condition, the season opened at Holyoke, Wednesday, with three shad by Thos. Chalmers. I hear also, on good authority, of nine more taken in the Housatonic.

—Walter Holberton, the artist, is at Ralston, Lycoming County, Pennsylvania. He says:—"The trout fishing here is very fair. I have been out five times and caught 224 trout. Notwithstanding this locality is fished all the time by some dozens of men every day, being right on the railroad, the number of fish remains about the same, but they get more shy, and I think run a little smaller."

—One of the most attractive regions in Canada for summer tourists embraces what is known as the Northern Lakes, a chain lying north of Toronto, and comprising Lakes Simcoe, Muskoka, Rosseau, and Cocochong. This is fast becoming a popular resort for sportsmen, and supplies the best bass fishing to be had in Canada, as well as superb trout fishing. Muskoka river abounds in large trout. Steamers run through Lakes Simcoe, Muskoka and Rosseau especially to accommodate excursionists, and are under the supervision of our friend Hon. A. P. Cockburn, M. P. This is no inaccessible wilderness country. Passengers can take the Northern Railroad at Toronto, and step on board the Simcoe boat at Barrie, where, and at Orillia, cheap and good accommodations can be supplied for the season. Both are large neat brick towns, and the summer trotting matches are among the chief attractions of Barrie. At the same time, one is within a few hours' sail of one of the wildest districts of Canada.

—Those of our angling friends who are annoyed by black flies will be interested in the following paragraph from the Eastport (Maine) Sentinel:

Black flies gathered in so large numbers at one point on the track of the E. and N. A. Railway one day last week, as actually to stop the train. It was an up grade, and the wheels and track were rendered so smooth and oily by the crushing of the flies as to prevent the train from going on, until the track for a distance was scraped.

—We clip the following interesting facts respecting black bass and black bass fishing in the Potomac from the Sunday Herald, of Washington:—

The first bass were turned loose in the Potomac about eighteen years ago by General Randolph, then constructing engineer of the Baltimore and Ohio railroad. About two hundred of these voracious beauties were placed in the river at Cumberland, having been brought from a Western stream in the water tank of a locomotive. Since that time they have multiplied so rapidly that now the Potomac, from tidewater to its source, abounds with them, and every year the sport which they afford increases. It is no uncommon thing to capture them weighing two and three pounds, and in some instances four-pounders are taken. Instances are related of others having been placed in the headwaters of the Potomac, and it is no doubt true that other gentlemen have put some in the river, but the largest number was put in by General Randolph, as above mentioned.

For successful fishing, good tackle is an indispensable requisite. It should consist of a twelve-foot jointed rod, fifty yards of braided linen line on a multiplying reel, New York bass hook, and a tin bucket of three gallons capacity, perforated, so as to keep the minnows alive. A cork is most always used, in order to keep the minnow about twelve inches from the bottom of the river when fishing in still water, as the bass keep close to the bottom, especially in warm weather. In rapid waters the cork should be nearer to the bait to keep it upon the surface. When the fish take the bait they swallow it immediately and run off, frequently taking twenty or thirty yards of line before they can be brought up and successfully hooked. They have a bony mouth, and not much flesh or skin to hold a hook; therefore, you are never sure of landing them unless you

play them so lightly as not to permit them a foot of slack line, except, perchance, they have gorged the hook.

The bass will rise to a fly in turbulent water, and in the rapids just below the dam, at the foot of the Little Falls, Great Falls, and many other minor slutes on the river, they are frequently taken by those fond of this style of fishing. This mode of angling, however, while it affords more excitement, is not so comfortable as from an anchored boat with an abundant supply of sandwiches and a bundle of fragrant cigars and accompanying articles. In selecting flies for them bright colors are the most desirable, as the fish seem to have a *penchant* for those colors. It is no uncommon thing for them to seize a bright float used in trolling, being attracted to the surface by its color and motion in the water. In one instance recently an old fisherman had his cork swallowed by a huge bass, but when an attempt was made to haul him up he soon disgorged the cork and made off.

The most desirable fishing ground is at the foot of the Great Falls, especially from April to June, when the bass run up to spawn, though there are many other places where they bite with equal rapidity. Stubblefield Falls, about eight miles above Georgetown; the basin, just above the dam; the rapids below the dam, and below the Little Falls, are all frequented by the disciples of Sir Izaak Walton, and numbers of beautiful bass are taken at these points. The season continues from April 15th to the 1st of November.

BRainerd, MINNESOTA, June 4, 1874.

EDITOR FOREST AND STREAM:—

Black bass, pike perch, pickerel and mascalonge began to be hungry for spoon-victuals about two weeks ago, and the fishing in all the innumerable lakes and ponds of this section, is now first rate. At Gull, Round and Long Lakes the pike perch fishing, (wall-eyed pike,) has been something remarkable this spring, even for that fishing country. No unusual occurrence to kill one or two hundred pounds in an evening with a spear; fish running large this year. The trolling at these lakes is good all the season. Reuben Gray keeps a stopping place at Gull Lake, a good-enough place for a hungry fisherman. Serpent Lake, at Withington Station, seventeen miles from here, is the favorite lake, on account of accessibility, its myriads of fish and beautiful surroundings.

Leaving here in the morning early one can fish all day, and return by evening train. Several of our fishists have "taken in" Serpent Lake this season for one day only, returning in the evening with from one to two hundred pounds of black bass. No one, as yet, has attempted to kill any with the fly; we propose to do so this week, when we will report.

The weather here is delightful, lakes bank full, fish plenty any where; and if any of your readers want to pass a few days in Northern Minnesota let them "pack their plunder" and have it checked for Brainerd.

The past mild winter has been very favorable for grouse and deer, and next fall there will be rare sport in the timber near here for the still-hunter, and further west, among the birds, which will cover the prairie as soon as seeds are ripe.

HAVILAND.

—From our valued correspondent, the author of some early papers on Anticosti Island, Gulf of St. Lawrence, we have received the following notes of fly-fishing in Newfoundland:—

ABBEYLEIX, QUEEN'S CO., IRELAND.

May 10, 1874.

EDITOR FOREST AND STREAM:—

In fulfillment of a promise made to you last autumn, I herewith forward you the undermentioned data, in connection with fly-fishing in some of the rivers along the south-west and western shores of Newfoundland. They are plain unvarnished extracts from the daily journal of an officer of one of H. M. gun vessels, whose duty last summer and autumn it was to cruise round the south and west coasts of the island for the protection of the Colonial Fisheries. At some of the rivers named below the ship only remained a few days, at others but as many hours, giving little time or opportunity for fishing. The officer, who has placed his journal at my disposal, assured me, however, that from the numbers of salmon seen in the rivers, and the fair success that attended the efforts of himself and brother-officers, he is convinced that had their stay been longer the "catch" would have been proportionately increased. Trusting the few facts here given may prove of interest to some of your readers, and help to settle the hitherto much-vexed question amongst sportsmen as to the *possibility* of killing salmon with the fly in the waters of Newfoundland,

I remain, very truly yours,

W. H. POE.

Trepassey, Biscay Bay River, in the month of June fished at high water on the sandy beach at the mouth of river, one rod in a few hours killed eight dozen sea trout, running from 1½, 3 and 4 lb.

La Poile Bay, northern arm of the river that empties into this bay contains salmon, and there are several good "runs" ½ mile from its mouth; 4th July, Captain ——— killed one 12 lb. salmon, day cloudy; 5th July, the same gentleman killed one 12 lb. salmon, day foggy; fly—No. 4 hook, red body, gold twist, turkey wings, peacock tail; another officer rose, but failed to hook, two more fish. The banks of this river are wooded, but you can fish up stream, where there is a shallow bank, with deep channels on either side; in the right hand channel only were salmon seen.

Port au Basque, about five miles to the westward of La Toile Bay, has a small, deep, but narrow stream; current very rapid; about one mile up are two small falls, four to five feet in height; 5th July, rose a salmon, evidently running up; day bright and clear.

Trout River, between York Harbor and Bonne Bay, (about thirty miles to the westward of York Harbor,) affords good casting ground from Shingly Beach, and sea trout are caught at junction of salt and fresh water. Three rods in five hours caught fifty fish, smallest weighing 2 lbs. and largest between 3 and 4 lbs.; no time to try for salmon up the river. Settlers catch them, as also the sea trout with nets, but knew nothing of fly-fishing.

Hawke Bay, Ingornachois Bay.—Three rivers discharge into Hawke Bay, which is completely landlocked, the land being high and thickly wooded. The eastern river of the three, about a mile from the mouth, which is narrow, is bifurcated by a small island, the forks, however, after diverging some 400 yards, uniting again in the main stream. 23th July, fished the left fork; the pilot, with a fly with red body and dark wings, rose four fish, one of which, an eleven pounder, he killed. An officer the same day hooked three fish, all of which he lost. 27th July, a bright clear day, two rods killed four salmon weighing 30 lbs. 28th July, above the forks, some two miles up the river, in a good pool, below the rapids, rose and hooked three fish—

1st was lost by bad "gaffing;" 2d, killed and weighed 16 lb.; 3d, while the man was trying to land it without a gaff, broke the line; fly, small hook, claret-colored body and hackle. During the ship's stay here some nice river trout, averaging from ½ to 1½ lb. each, were taken on the rod.

—A letter from our correspondent in Queen's County, Ireland, says that the drought has been so severe in that section this spring as to wholly prevent salmon fishing. The rivers are low, and repeated attempts to get a rise have proved utter failures.

—There is a law in Massachusetts directed towards catching the baby lobsters. Exactly the same ordinance should be passed in all the States, in order to protect the infant trout. It is a crying shame for us to know—and we hear of it every day, that fishermen bring in poor little fish, not longer than a baby's forefinger, and brag of a big score of fifty and sixty trout, when the whole of them would hardly weigh a pound. Let all true fishermen unite with us in stopping this useless and wasteful slaughter of trout. If we ever have a suitable opportunity we will press a legal provision of \$25 penalty for any one found with fingerlings in his possession.

New Publications.

Publications sent to this office, treating upon subjects that come within the scope of the paper, will receive special attention. The receipt of all books delivered at our Editorial Rooms will be promptly acknowledged in the next issue. Publishers will confer a favor by promptly advising us of any omission in this respect. Prices of books inserted when desired.

THE AMERICAN YACHT LIST FOR 1874, is the title of a register's book for the American Yacht Club, recently published by J. H. Bigelow of 13 William street. In the first pages are the club signals—"burgees"—of all the existing yacht clubs, and the body of the work is filled with the registry of the club officers, secretary's addresses, yachts, and with the names of winning yachts for 1873, with tables, moon phases, and other information valuable to yachtsmen. The work is edited by Mr. Neals Olsen, and it is nicely printed.

STEAMSHIP AND YACHT SIGNALS. Mr. Arthur Grandville has just issued a book which will be found useful to shipmasters, as well as yachtsmen, as it contains the house flags, night signals, funnel marks, &c. of the coastwise and transatlantic steamships, as well as the private signals of the various yachts of the American Yacht Club. The book is published by Pelletrean & Raynor, 35 Vesey street.

GEOLOGY. By A. Geike, LL.D. D. Appleton & Co.

This is one of the series of those valuable little books issued by the Messrs. Appleton, under the title of "Science primers." They contain a large amount of knowledge that should be in the possession of everyone. The simple, practical style in which the subject of geology is treated, renders this work valuable alike to the agriculturist and scholar. We can cheerfully recommend this little work as every way deserving the consideration of even the general reader.

Harper & Brothers have placed before us "John Worthington's Name," an American novel of American society and private life. This effort at American novel writing is by Frank Lee Benedict, not an unknown name to American readers. In this work he gives a racy, readable book about life at home and sketches of foreign travel. The leading incidents, which are exceedingly well told, will be found in the experiences of a "fascinating young widow," who gets severely handled in her associations with Wall street bears and bulls; becoming much involved in sundry speculations, she finds, too late, that "all is not gold that glitters," and in one of her sad moments—we suppose becoming somewhat desperate at the gordian knot that ties up her purse—she does just as many other desperate people have done before her. She forges the name of an old friend, who proves himself her true friend, in whose large breast there dwells sufficient charity to cover her multitude of sins. He says he "loves her;" at any rate he marries her, and all is bright and beautiful. This is the main story of this interesting plot, while a second episode runs on in an under current, and develops into quite a story at that world-renowned watering place—Baden. From the memoranda beneath his hand Mr. Benedict Lee gives us a truly readable American novel, the interest of which never flags from the beginning to the end.

BEATEN PATHS; or, A Woman's Vacation. By Ella Witherspoon Boston: Lee & Shepard.

The wandering of seven unprotected females up and down Europe lead us to pronounce them well fitted to travel without a male escort. This work, although it is only a new traveler upon the old beaten path of a tour to Europe, develops in good, plain English, many things seen by the writer and is written in a somewhat humorous, lively style. We see sometimes in the course of this narrative some old ideas and new descriptions of old places that much please us. We have read many books upon the subject upon which this treats with far less satisfaction and pleasure than we perused this. The authoress is a Boston lady, unknown to fame, but she has given us a book that will receive a cordial reception, and we think in her next book she will find a full appreciation of the talent for narrative story-telling she so evidently possesses.

POEMS. By H. R. Hudson. Boston: James R. Osgood & Co.

This is a collection of poems of more than ordinary interest, and breathes a freshness not often found in poems of this varied character. Much will be found in this little unobtrusive volume that will find a ready response in many hearts. Every lover of the pure, refined and beautiful in humanity will find his heart strengthened and his sympathies for all that is good awakened, and we feel that he will arise from its perusal a better man. How true the poem of "Grandma!" Who will not readily recognize in the lines

"Grandma does not hear or stir,
Only lies there with a smile;
Nothing seems to trouble her
For the while"—

one sweet remembered face, one kind heart that beats no more; one dear old venerable face, as he looks back to the days of his early youth when he looked on those silvered hairs for the last time on earth. These poems may be read with profit by anyone who loves the pure and good.

BOOKS RECEIVED.

CHAPTERS ON ANIMALS. Philip Gilbert Hamilton, Roberts Brothers. Boston: 1874.

We have received the first volume of Porter & Coates' Household Edition of the Waverly Novels, and judging from the style engravings and letter press of this new candidate for public favor, we know almost that it will have a ready sale. It is in fine, large, clear type, and furnished by subscription at the low price of \$1.50 per vol.

—Thirty kinds of fish are known to dwell in Cayuga Lake.

—A horse left uncovered when not in exercise will soon grow a heavy coat of hair. This becomes a hindrance to rapid motion, and should be prevented by judicious blanketing.

Ask your Dealer, or send direct to our works for a supply of PURE Tobacco.

VIENNA, AUSTRIA, NOV. 30, 1873.

Messrs. Wm. S. Kimball & Co.

Sirs—A friend of mine sent me, with a transport of Indian Skulls, two pounds of "Vanity Fair," which I declare to be the best Tobacco I ever smoked. We have very good tobacco in Vienna—Turkish and Hungarian, but "Vanity Fair" is the King of all, by its aromatic flavor and the right sort of strength. My friend in New York got an appointment in California, by that reason I apply immediately to you, begging you to send me the enclosed ten dollars, a supply of "Vanity Fair," and send with the next steamer to Germany. If there is a German firm that sells your excellent "Vanity Fair," I beg you to enclose me the address.

REMINGTON'S CHALLENGE

Long Range, Breech Loading,
TARGET RIFLE.

Weight, 10 lbs.
Length of barrel, 34 inches.
Calibre, .44-100 in.

Pistol-grip Stock, Fine Walnut
Oil Finished, Checked Grip. Case-
hardened mounting.

The following discs for front sights.

Open bead Bar and Slit Bar & Open Bead.

Price as above, \$100 00
Price without pistol-grip, \$90 00
With orthoptic and bead sights, \$65
ordinary stock, \$41 00
Extra discs, ea, \$2 50
Spirit level, \$5 00

The above rifle was the winner of all the prizes for accurate shooting at Creedmoor at the last spring meet- ing. 102 out of 123 at the fall meeting, "Turf, Field and Farm" Badge, 3 out of 4 times. Amateur Rifle Club Badge (final). Diamond Badge, first and only time. For authentic record of above see N. R. A. First Annual Report, just out. At the match Saturday, 16th inst., 7 Remington and 7 other rifles were used, resulting in a score of 302 for Remington and 287 for the others, giving Remington's 15 gain, or two points to each man. For full particulars of these rifles address

At the "Long Range Match" of the "Amateur Rifle Club" on the 30th ult, 6 REMINGTON and 12 other rifles were entered. The score which we append below shows that the REMINGTON still maintains its superi- ority:

	800 yards,	Average for Remington,	15	Average for others,	8 2-3
	900 yards,	do. do.	11 2-3	do. do.	5 11-12
	1,000 yards,	do. do.	9 5-16	do. do.	8 1-2
		Total average,	12	Total average,	8

Net gain of REMINGTON over all others, 50 PERCENT. At the 1,000 yard range only the eight highest in previous ranges were allowed to enter, which though admitting all the Remington's, admitted only two of the others. This fact will account for the approximate average at 1,000 yards. The two best marksmen on each side scored 30 with Remington's to 17 with the others. "Blood will tell!" See this paper, of June 4th, for official record of the above.

E. REMINGTON & SONS, 281 and 283 Broadway, N. Y.,
OR ARMORY, ILION, N. Y.

This arm was submitted in competition with over one hundred different systems, American and Euro- pean, to the Board of United States Officers, appointed by Act of Congress, 6th June, 1872, for the purpose of selecting the best arm for the service, and of which Brig. Gen. A. H. Terry was President. It suc- cessfully passed through all the tests.

The following is the report of the Board:
"Resolved, That the adoption of magazine guns for the military service by all nations is only a question of time; that whenever an arm shall be devised which shall be as effective as a single breech-loader, as the best of the existing breech-loading arms, and shall at the same time possess a safe and easily manipulated magazine, every consideration of public policy will re- quire its adoption.

Resolved, further, That the experiments before the Board with the Ward-Burton Magazine System have so impressed the Board with the merits of this gun, that they consider it as more nearly fulfilling the con- ditions above specified than any other tried by them or of which they have any knowledge, and it does recommend that a number of magazine muskets be made on the plan for further trial in the field." (See Ordnance Report.)

We are now receiving orders for these guns, and due notice will be given in this paper when they are ready for delivery.

The following is our scale of prices: Special Maga- zine for large game, carrying from 3 to 8 cartridges, 70 to 85 grs. of powder, 350 to 400 grs. of lead, 8 to 10 lbs. weight, from \$60 and upwards, according to finish. Special Long-range Magazine Rifle for Creedmoor shooting, 90 grs. of powder, 480 grs. of lead, carrying 3 to 8 cartridges, weighing 10 lbs., from \$100 and up- ward. Magazine guns for general use, carrying 3 to 9 cartridges, 60 grs. powder, 350 grs. lead from \$40 and upward. Single Breech-Loader, Creedmoor shooting, for long range, 90 grs. powder, 480 grs. lead, from \$60 and upward. Single Breech-Loader for general use, 6 to 7 lbs., 60 grs. powder, 350 grs. lead, from \$30 and upward. The calibre of all our rifles, unless otherwise ordered, will be .45-100 in.

For Forest and Stream.
JUNE ROSES.
HIRAM E. GRIFFITH.

"THE first of the season," she said
"How sweet their perfume, too!"
And she pinned two rose buds to my coat
All wet with morning's dew;
And I kissed her ere I turned to go
Out in the dusty street,
And all that day in the dingy town
My thoughts of home were sweet.

And into my office all the day
Thronged weary and dusty men,
But with lighter tread they turned away
Out in the street again;
For the fragrance of the rose buds,
With their colors rich and rare,
Stirred up the memories of youth
In all hearts gathered there.

Aye, hot and dusty the town that day.
And a thousand cares had I,
But with smiles I met those ills of life,
And they passed me lightly by;
And my thoughts would wander far away,
To pleasant summer bowers,
And my heart beat closer up to God,
The gardener of all flowers.

Could those June roses be embalmed,
And hold their fragrance true,
And be forever as they were,
All fresh with heaven's dew,
No diamonds, and no rubies rare,
No corals from the sea,
Would be in value half the worth
Those pure buds would to me.

Most charming they would ever be,
Telling of pleasant ways,
Of paths of green by running stream,
Of sunny, summer days;
And needle-like would ever point
To a wife that loves me true,
Whose heart through all these many years
Still wears its morning dew.

For Forest and Stream.

Sports in California.

No. III.—WOODCRAFT.

AS our fishing and hunting excursions sometimes led us into danger, an Indian war having been carried on in that part of the country at that time, a few instances, by way of illustrations of woodcraft, may prove not uninteresting. And, when it is remembered that the famous "Lava-Beds" are almost as near to Humboldt Bay as New York is to Philadelphia, that the Indians were of the same set of tribes as the comrades of Captain Jack, (though their chief, Lassick, was not equal to Jack in ability,) and the war carried on was of the same general character, the interest will in no wise be decreased.

One lively bright day we concluded that we would go trout-fishing, although it was unsafe. We had become tired of staying at home or going to the town, and we wanted some excitement; so at lunch, (1 P. M.,) we settled it. There were half a dozen of us, and all, except myself, had been many years on the frontier and had much experience in Indian matters—were, in fact, "old Indian fighters," well skilled in the wiles and stratagems of our dusky foe, and adepts in woodcraft. I, too, was not altogether a novice in reading "Indian sign," for a year's residence in the country had taught me much, and my ears and eyes had always been open to this kind of lore. But woodcraft cannot be acquired in a day, so, though not exactly "green," I was yet but a tyro compared to the rest. The experience of that day, however, is indelibly imprinted upon my memory, and I plume myself not a little on my application of the few lessons I had learned.

About 2 P. M. we mounted our mules and started. Mules are far preferable to horses for mountain or forest work. They scramble over roots, stones and boulders; slide down, or clamber up steep declivities; and go through

briers or swamps in a manner perfectly unattainable by a horse. Then, too, they will stand tied more quietly and patiently, and are less troublesome to care for. But, best of all, they are the most watchful sentinels for Indians that exist. They will scent an Indian a mile, or more, if the wind be blowing strongly from the direction of "Mr. Lo," and indicate his vicinity by a restlessness and desire to escape, with ears pricked forward and glaring eyes, in a manner that, to the initiated, is unmistakable. So we rode mules.

The day was lovely—the sun shone brightly—the air was clear and bracing—the temperature perfection. It was like some of those lovely Indian summer days of our autumn, without the lassitude which invariably accompanies them. We felt fresh, bright and equal to any emergency, and we left the Post, with our rods under arms, our cigars well alight, in full rig, (only we used haversacks for creels, which were unattainable there.) Our party were well armed with revolvers and knives, and we considered ourselves equal to any dozen Indians in the "District," if it came to the scratch. In those days these arms were a part of our regular dress, put on when we arose in the morning and not dispensed with until we retired for the night. Our "fishing ground" was a small mountain stream which lay about six miles to the south of the Post, in the heart of the redwood forest and in the bosom of the hills. The road to it was a bridle-path, which skirted thickets, wound around the massive trunks of the gigantic redwoods, traversed ravines, and finally debouched upon the bank of the stream in a lovely little plateau covered with clumps of varied undergrowth, shaded by tall trees, and carpeted with a lovely green sod which was bespangled with a thousand varieties of charming flowers. The little stream murmured invitingly as it ran along its gravelly bed, and here and there was dotted with dark pools which were the favorite homes of our speckled prey.

Quickly dismounting we unsaddled our mules, tied them strongly to the saplings, and getting our tackle in shape, were soon in the bed of the stream. By this term I mean the water, not the bed proper of the stream, for that was, perhaps, an average of forty yards in width; and the little creek, during the rainy season, filled its high banks to the brim and was a roaring torrent whose booming could be heard a mile. But now the water was low and the stream narrow, save where it opened into a quiet glassy pool. It ran along close under the bank, now on one side, now on the other. The rest of the bed was either a wide smooth sand bar, or a precipitous mass of boulders, piled together in every form and worn into varied shapes by the action of the water. We fished up stream, partly because we knew the trout lie head to the current and so could not see us as we advanced, and partly because the return, when we were tired and laden, would be easier. I may here remark that although the trout were abundant and not very shy, yet the large ones were always wary and required all the art of the angler to effect their capture.

Being soonest ready, I led the van, the others following at various intervals, from one to five hundred yards. Passing from pool to pool in search of large fellows, and leaving the greater part of the stream unfished, I was soon half a mile in advance of the party. I had just turned a sharp angle of the creek and was stealing quietly toward a beautiful pool where I fancied might be "a rouser," when, raising my eyes to see that I had room to throw my fly neatly, I spied on the surface of one of the stones lying at the head of the pool, the outline of a moccasin—only one edge, but clearly defined against the surface of the glittering micaeous sandstone. I stepped aside—it disappeared. I stepped back—there it was. There was no mistake.

To say I was startled would be faint language. My heart was in my mouth. I dared hardly breathe. Danger lurked on every side. Any moment a bullet or an arrow might be seeking my body for a target. I already felt it—in my chest—my back—my head—everywhere. Savage eyes were upon me, and I was doubtless appropriated as a lawful prize. I felt—I felt—I really cannot tell how I did feel.

The danger was imminent. A single wrong move on my part and the whole party would be sacrificed. I held their lives in my hand, and I was alone and inexperienced. At such times it is wonderful how immense the amount of ideas which pass through the brain. One lives a lifetime in a moment. I never before could realize how the vizier, in the eastern tale, when told by the astrologer to plunge his head in a bowl of water and hold it there an instant, and, when he took it out, relate to the bystanders what he saw—did so—and lived years; each day and incident being clearly marked and filled with the greatest variety of thought and deed, success and good fortune—as he thought. Yet, when he removed his head and returned, seemingly, to his former state, found that the time had not been thirty seconds.

What I thought then I could not tell you if I filled a hundred numbers of your valuable journal. But it was no time to dally. I must act, and at once. I must betray no knowledge of my discovery. I must seem to be intent on the capture of my finny prey and to have never heard of an Indian or of danger. How I managed it I cannot say; but this, as nearly as I can recollect, is what I did. I threw my fly and caught a good-sized trout, transferred him to my haversack, and threw again, but this time missed—hand trembled too much, I suppose. Turning, I fished slowly down the stream. All this time, which to me seemed ages, but was, probably, not ten minutes, my back was turned towards the bushes where I supposed the savage foe lay concealed. Why no attack was made, though I expected every moment to hear the crack of a rifle or feel an arrow, I could not conjecture, unless they had a trap to catch the whole party, and my whole thought was to join that party and give the alarm. I dared not turn round to look, but not a sound escaped my ear. I believe I could have heard a bird alight on a branch, no matter how small he might have been, my nerves were so highly strung and sensitive. Almost breathless I watched and waited, and all the time was fishing slowly and steadily down the stream. I thought I never would get there, but at last I turned the angle of the stream, passed out of sight of the place where I had discovered the "sign," threw my rod into the bushes, and, if ever "footsteps had wings," mine had. At a pace which would have shamed the "American deer," I dashed over sand-bar and boulder. I was somewhat lighter then than now, and was in good training, so the speed was tremendous and sustained. My companions saw me coming and, surmising the cause, at once disposed of their rods in a manner similar to mine, and, as I came up, joined me, as the word "Indians" escaped my lips. In a few moments we arrived at the place where our mules were fastened. The animals were straining at their halters and unmistakably showed that danger was near. We threw on the saddles, hardly taking time to buckle the girths, and, hastily mounting, galloped off as hard as we could go, the mules, in their terror, being no laggards and requiring little urging. We arrived safely at the Post, gave the alarm, a party went out, but the savages had decamped.

We heard a few days later, through some friendly Indians, that a band of sixteen Indians belonging to the tribes dwelling about the head of Eel River, a war party, had been in that neighborhood, and hearing us scamper off, had tried to intercept us, but we had gotten by before they could reach the trail. They were on their way to attack an outlying settler, who, thanks to us, escaped attack, as the Indians, fearing pursuit from the Fort, lost no time in decamping when they found we had gone clear. They had evidently passed over the spot where I saw the track not twenty minutes before my arrival. Trout fishing is a quiet pursuit; for this shyest of fish are as watchful and wary as the savages, and, thanks to that, our advance had been as quiet as that of the Indians themselves, and they had not heard us. Not supposing a fishing party would be out at such a time, or so far from the Post, they never dreamed of looking for us. Had they seen us before I saw their trail—an ambush—a few rifle shots—and our friends would have found our remains peacefully lying by the shady

brook, sleeping the sleep that knows no waking. Owing to some knowledge of woodcraft we escaped.

In narrating all this I have made no mention of any "sign," save "the outline of one edge of a moccasin," and the uninitiated will say, "What a fool to care for that. It might have been a week old for all he knows. Why did he not go and examine it? Why did he turn away, and the moment he got round the angle of the stream, race off like a madman?" "Softly, my friend, and I will translate that 'single cutline of the side of a moccasin.'"

The spot where the occurrence took place lay nearly due east and west, and the sun was about three hours high; just the latter part of the afternoon, say four o'clock. Consequently, its rays shone right down the creek, and directly in my face as I went up. Ergo, anything between the sun and myself would give a shadow. When I stepped aside, I threw the faint outline of the moccasin track out of the line of the direct rays of the sun, and it disappeared. I stepped back, and it reappeared. This is simple. The creek was rather wider here than usual, and the pool, or rather series of pools, some eighty or ninety yards long. The stream on the south side ran close under the bank, which was densely covered with the overhanging thicket of alder, wild rose and briars of every kind. On the north side of the creek was a wide sand-bar, perfectly smooth, the wind, as it blew down the creek, having swept it as evenly as a floor, and on this sand there was no footprint, though the toe of the moccasin pointed to it, and it was so soft and yielding that I sank in it half shoe deep. In the stream itself were several clusters of rocks, dividing it into pools; their tops being above water and not so far apart but that a man could spring from the shore to a rock, and from rock to rock, and so cross over dry shod. On one of the rocks the wind had blown a little sand, in which the foot-print was partly stamped. This was only visible when brought directly between the sun and myself. No one could see it in any other position, and it had thus escaped the keen eyes of the savages. On the north side of the sand-bar the dense undergrowth came down as thick and as close as on the south side. An acute and practiced observer would also have noticed that the sand of the bar, though perfectly smooth, yet did not look precisely correct. You could not exactly say parts looked fresher or were more uneven than the rest; yet, a perfect woodsman would have noticed this indescribable something, though the untaught would have asseverated that there was nothing unusual there.

These were the circumstances, and here is the translation:—

First, the outline of a moccasin showed that some human being had passed over the spot, and that human being an Indian. "It might have been a hunter," I hear some one say. "No," for a hunter would have walked along the bar and left a wide trail easily seen, for in that place he could have had no cause for concealment. Next, the lines of the heel and toe, projected, led from one dense thicket to the other, in a short bend of the stream where any one crossing would be visible but for a short distance and a few moments. And there was no other sign visible—the trail had been concealed. "How?" The Indians, one after the other, ("Indian file,") separating the branches had sprung from the high bank to the rocks and crossed the sand-bar, each treading in the steps of the other so as to make as small a trail as possible. The one had drawn the bushes together so as to show no gap and look perfectly natural, and when he crossed the sand-bar, with a branch, previously plucked far off in the woods, as with a broom, had carefully swept away all traces of the trail, a few handfuls of perfectly dry sand obliterating all signs of freshness.

Well, we have now a concealed Indian trail. What does that mean? A war party. I need not explain this term; every one who "reads the papers" knows that it means death, rapine, destruction, and all kinds of diabolical outrage. So here was the trail of a band of Indians on the war path. But my friend says "it might have been a week old." "Hold," the same wind that blew the sand on the rock would blow it off again. It was, even then, a little puffy, and the outline of one edge of the track only remained, and that would not be for long. The day had not been remarkably quiet. The morning breeze had commenced at the usual hour, and it had been blowing all day—sometimes quietly and steadily, and sometimes fitfully and in gusts. What then? Why, the trail could be but a few minutes old or it would have been blown away. A war party then must have passed less than twenty minutes before my arrival.

Have I made out my case? Verily, woodcraft is a science, and "a straw will show which way the wind blows." "There are sermons in stones, books in running brooks, and God in everything," and to Him be thanks for giving us the intellect to read the lessons of the woods.

We recovered our rods and lines by sending one of the friendly Indians for them. An Indian can find anything if you can at all approximate its locality. The same Indian also told us our foes numbered sixteen. Whether he learned it from others, or followed up the trail and so discovered it, I never asked. An Indian thinks it silly to ask questions, and the "Big Medicine" of the "Great White Chief" could not condescend to expose his ignorance.

MOXMOOTH.

For Forest and Stream.

THE NEVERSINK COUNTRY.

THOSE who love fishing, not merely for its associations, and love nature as well; who would be content to wade the stream all day, perhaps without landing a half pounder, and who enjoy the hardships of a life in the woods, and the spice of camping out; would do well to make a short trip to the wild lands of Ulster and Sullivan counties. They are easy of access, and in point of solitude. I have no doubt they are superior to the Adirondacks, where, I believe a man can not bathe in a mountain lake without cutting his feet on the remnants of some broken whiskey bottle, or lie down at night without staining his blanket on a cigar stump—eloquent traces of some of our modern woodsmen.

The Beaverkill and Neversink rivers, the most important streams in this region, have for many years been well known to New York sportsmen, and are now almost abandoned, and considered "fished out," but there are still many parts of this wilderness, especially at the headwaters of the Neversink and its tributaries, which have never yet been visited by the white man, and numerous streams, small but well stocked with gamey little trout, and unfished, save by the wary mink.

During the summer of 1872-3, in company with a college friend, I traversed these solitudes in all directions, climb-

ing mountains and exploring lonely valleys by day, and camping at sunset by some cool mossy stream, where twenty minutes fishing always provided an ample supper. Often after we had selected a spot for our camp, clearing away the brush and starting the fire, just as the shadows were gathering beneath the hemlocks, we would sally forth, flyrod in hand, one up and the other down stream, stealing silently along the margin, treading deftly on mossy stones, and easting over dark rifts, and returning through the dark woods, one to dress the trout while the other made ready the coffee and flapjacks.

And then after supper, piling one or two green beech logs on the fire, and lighting cigar or pipe, we would lie back on the damp, springy balsam boughs, and pass the hour before bed time in telling old stories and singing old songs. It is very pleasant, this lying out in the woods and talking oneself to sleep without even the responsibility of going to bed. A great advantage over civilization, where if one feels sleepy he has to undergo the torture of undressing himself, after which he is thoroughly roused up, and may lie awake all night.

There are several ways of reaching this region, but the shortest and least expensive is to take the afternoon boat from New York to Rondout, on the Hudson, and pass the night at a hotel, taking the 7 A. M. train the next morning on the Rondout & Oswego R. R. for Big Indian Station. Reaching here at 9 A. M. a tramp of five or six miles on a road which follows the Big Indian River to near its headwaters, and then crosses the mountains, will take you to the sources of the west branch of the Neversink. There are log houses here and there along the road at which you can inquire the way and purchase such provisions as you can carry. It will pay to camp the first night on the Big Indian, and by striking down a bark peelers' road about half a mile above the last saw mill, you will reach a wild little hollow through which the stream flows. A rod or two above the old corduroy bridge, and close beside the stream are the poles of a shanty, and in front of them the remains of a fire, where I camped one night last summer, and had fair luck with the trout before dark and after sunrise the next morning. The east and west branches flow about twelve miles separated by high and thickly wooded mountain ranges, before uniting to form the main stream. Each is full of trout, as are also the Biscuit and Fall Brooks, tributaries of the west branch. The trout are small, a half pounder being generally the maximum of a day's fishing, and the average much less. The most taking flies I have found to be the whitewinged coachman and the brown hen. But the trout rise so well to every thing, there is no necessity of changing the cast very often.

The expenses of a two or three weeks trip, including extras, are \$15. Items: Fare on boat from New York to Rondout, including supper \$2, hotel at Rondout, \$1.50, fare to Big Indian, about \$2, making for trip and return \$11.00. As there are no expenses after leaving Big Indian Station, except buying bread and butter &c., at an occasional log house, the \$4 remaining will be amply sufficient.

For baggage I carry a fly rod, axe, rubber blanket, coffee pot and creel. Although the nights are usually very cold, I have dispensed with the blanket, and carry only a rubber blanket to roof the shanty. Though wild pigeons are sometimes numerous, it will be hardly necessary to carry a gun, unless for the study of ornithology. Partridges, though abundant, are out of season, and the latter is also the case with deer, which may be sometimes seen. Many of the rarer warblers will be found breeding here, as also the hermit thrush, olive backed thrush, and olive sided flycatcher. Bear tracks are frequently seen, and foxes and porcupines though, very numerous, are not often met with.

In closing I would remark that the Neversink country is no place for those who cannot camp out without all the luxuries of civilization and who require three or four guides to do their work. Guides cannot be had, and a man must be content with such luxuries as he can carry on his back for ten miles over some of the steepest mountains in the State.

P. C. B.

For Forest and Stream.

THE SALMON FISHERIES OF OREGON.

SO very few from New York visit this portion of the Union it occurred to me that some practical remarks on the great pleasure they lose might not prove unacceptable, especially as the trip can be made so easily and with comfort. Good steamers make the trip from San Francisco to the bar of the Columbia River in from fifty to sixty hours, and, if not delayed by a heavy sea or fog from crossing this dangerous bar, pass right into Astoria and up the river a trifle over 100 miles to Portland, Oregon. They stop on their way up at the different salmon canneries to leave supplies of tin, solder, etc. The steamer J. D. Stephens, in which we came, had about \$40,000 worth of tin alone to be used in making cans.

There are nine important canneries, and the amount of salmon packed up is immense. At the present time equal to ten thousand fresh salmon, averaging twenty-two pounds each, are daily cut up and packed in the cans of one, two, and three pounds each, and shipped via San Francisco to all parts of the world. These salmon are purchased by contract from the fishermen, the price this year for each salmon being twenty-five cents per fish, not pounds, no matter if it weighs ten pounds or fifty. I saw one of fifty-four pounds weight which cost but twenty-five cents. The meshes of the nets are made so large that but few fish under twenty pounds are taken, the general average being placed at twenty-two pounds weight by the fishermen themselves.

The labor in the canneries is done almost entirely by Chinamen, who become exceedingly expert at the business. One man, with a large sharp knife, severs the head at one blow, then rapidly cuts off the tail and fins, and opens and cleans the fish in a few seconds, passing it into a large tub of water to be washed. Another places it on a table, turns a crank, and a number of circular knives cut it into the proper sizes for packing into the cans, which the others are constantly engaged at. The lid is soldered on, leaving a pin hole in the centre; then the cans are lowered into hot water for a short time to exclude all air, and the pin hole immediately soldered up, which seals them hermetically. When cool the cans are packed into boxes of four dozens of one pound each, and ready for market. The steamer on which I write has on board 7,000 boxes, equal to 175 tons of fresh salmon, and this business goes on for about three and a half months every year.

The waters of the Columbia are cold, and the flavor of

the fish excellent, much better than those taken in the California rivers, which are warmer, being in some ten degrees lower latitude. I have inquired of everybody I thought likely to know if they had ever known the salmon to rise to a fly in the Columbia River, and invariably they have answered no, except one person, who had heard of a fly fisherman having been successful in the Columbia above the Snake River, one of its largest tributaries. To me the reason is very apparent. I have killed salmon in the rivers emptying into the St. Lawrence, but the water was always clear, while here, during the fishing season, the snows are melting in the Cascade and other mountain ranges continually, which make the waters of the Snake River very cloudy, affecting the whole of the Columbia below it, and giving it a muddy appearance, which is very perceptible outside of its entrance into the Pacific Ocean. This, I think, is the only reason why salmon will not take the fly, for in Puget Sound, which I visited also, they do take the fly readily, but the water is beautifully clear and cold. Some told me that at the mouth of this river fresh run salmon are taken with roe bait and the murderous spoon, but of course no sportsman will kill a salmon with such weapons. The salmon fisheries of the Columbia last year amounted to \$4,000,000; one man alone cleared \$70,000 profit. At the Cascades and Dalles the Indians take them out with scoop nets. I saw two taken at once.

Portland is a thriving city, situated on the Willamette River, a few miles above the Columbia. At Portland the tourist takes a river steamer for the Cascades and Dalles City, and a short railroad to Celilo, giving a fine view of the whole of the Dalles. The scenery on the Columbia is magnificent, and well repays for the long journey made from New York or elsewhere.

Steamer "Ajax," Columbia River, Oregon, May, 1874.

For Forest and Stream.

JAUNTS ROUND 'FRISCO.

NOW that "Vasquez," the bandit, has been captured, and California has been relieved of one of the greatest drawbacks to the pleasure of the tourist, perhaps a few notes regarding the pleasantest excursion one can take from San Francisco in a day will not prove uninteresting to your numerous and pleasure-loving readers. My business for some years was that of a commercial traveller in California, and when I state of all the numerous rides and stage coach journeys I ever took in that State none embrace so great a variety of scenery, both landscape and marine, with such great variations of temperature, as a trip across the Santa Cruz mountains in the spring time, you will doubtless believe me.

The stage leaves Santa Cruz at nine A. M., and I would advise your readers to engage a seat on the outside, with the driver. This can be done by telegram from your hotel the day before. No fear of rains, as it rains only in the winter months in California. The first of the journey, after leaving Santa Cruz, is dull, dusty, and altogether uninteresting and hot, but as the stage commences to ascend the mountains the air becomes cool, the dust you have left behind, and instead are to be seen on either hand flowers of every hue and fragrance. Presently you come to a beautiful spring of mountain water, from which "Jehu" waters his six horses, and as he mounts to his seat he will tell you how many thousand trout can be caught. Remember, here you have no mosquitoes. The air is loaded with the perfume of flowers, and "camping out" is a luxury that the most delicate invalids indulge in. If you should not fancy camping out, or roughing it, the Fifth Avenue hotel is not far distant from this and numerous other streams of equal beauty, and possessing as many attractions for the "piscator" as the one just passed.

Perhaps a description of the Fifth Avenue hotel of the Santa Cruz country would not prove uninteresting. About midway to the summit the forest trees assume proportions perfectly astonishing to a stranger in California. They are not as large as the trees of "Calaveras Grove," but you can form some idea of their immensity when I tell you that several of the trunks of them have been dug out so as to form sleeping apartments, in some of which are five or six couches, and in one is a large drinking establishment, where champagne on draught can be had at two bits (twenty-five cents) a glass. The proprietor of this rustic retreat is a great "piscator," and quite an artist in his way. The stage is welcomed on its arrival by the proprietor, violin in hand, upon which he plays a selection from some opera, accompanying the instrument with a voice not altogether bad. The fare here is good; the fishing in the locality better. This hotel possesses a great many advantages. It is cool and airy, no bugs of any kind, and although one has to "sleep in a tree," you need have no fear of lightning striking it, for a thunder storm has not occurred in California but twice in fifteen years. The mountain scenery is very grand. As the stage ascends the mountain the air commences to have a slight aroma of the sea, and is constantly getting cooler till the summit is reached.

Before reaching the summit the stage stops at "Mountain George's." He is the chief guide and hunter of the range, and is the greatest enemy of bruin in California. His head and face are most frightfully scarred. From the former a large piece of the skull was knocked out by a cinnamon bear about six years since. Small game, such as quail, mountain, or jackass rabbit, George can find, but "bar" is his specialty. He will warrant any of his friends a shot at a bear if the friend goes according to his (George's) directions. He is a most amusing companion on a hunt, and rarely returns to his home without bringing in a fine specimen of the "monarch of the American forest." Those of your readers who are fond of this sort of sport would do well to give George a call when they go to California.

The stage reaches the summit shortly after this stop, and such a sight! The grand old ocean stretches out before you, and you wonder why at this altitude China and Japan cannot be seen. Truly they are just before you, and no object intervenes to obstruct the view. The ascent has been slow and laborious—for the horses. So much has been passed of interest, so much that is new, so many changes from the parched valley of Santa Clara to the summit of these beautiful mountains, whose tops and sides are always green, always inviting, where game and fish abound, that time has slipped by, as it were, unobserved. You are not fatigued; you look forward to your journey's end with a feeling of regret, and say inwardly I would like to go right back over the same road.

The descent is rapid, and at times the curves in the road are so abrupt that the leaders are lost to view in the foliage and flowers ahead. The horses go down the mountain at a

rapid trot, at times galloping. One is startled at first, but on contemplating the coolness of the driver, and the instinct of the horses, these fears vanish, and you settle yourself down calmly to enjoy the beautiful sunset in the grand old Pacific just ahead. No one can describe a sunset with any satisfaction to oneself or the party who is so unfortunate as to have to read it, then why should I endeavor to do so? The sunset, as viewed from the Santa Cruz mountains, are gorgeously magnificent, as all will testify who have been fortunate enough to witness one.

Santa Cruz is reached in time for a good dinner. You will find there good sea fishing, good bathing, good hotels, good society, a prosperous little city, a lovely climate, charming scenery, and a splendid steamer to take you back to Frisco if you choose to go by sea. All who visit California I would advise to take this trip.

BUENA VENTURA.

For Forest and Stream.

THE BAIE DES CHALEURS.

A CRUISE AFTER SALMON.

LET me tell you about a summer trip to the Provinces that a small party of us took last year.

First, you must know that we are old hands at trouting, and that the secrets of the Adirondacks and of the Maine woods, of the noisy mountain brooks of New Hampshire, and the placid streams of Cape Cod, are known to us; that in pursuit of our speckled game we have explored every State in New England, as well as New York State, that we had fished the streams on the northern side of the St. Lawrence to a distance of a hundred miles below the Saguenay, and the rivers of Nova Scotia far to the eastward of Halifax; and one of our last year's party is now trying to sustain his reputation as a fisherman in the far off State of California. This time, however, we were in pursuit of nobler game—nothing less than the lordly salmon.

Without an idea of where we should bring up, we took one of the steamers of the International Line at 8 A. M. on a broiling day in early July, for St. John; and all day long we sailed, now past the rocky shores of Cape Ann, with its wooded bays, now by the long low beaches of New Hampshire and Maine, till we reached Portland in the middle of the afternoon. Here we landed for an hour or two and walked along its shaded streets; then re-embarking we sped along, enjoying the moonlight till bed time and sleeping quietly through the night; next morning we were at Eastport, the farthest point east over which float the Stars and Stripes; thence on to St. John, where we arrived at about 5 P. M. We set to work at once buying our stores and making inquiries regarding the fishing. There are some very pleasant excursions to be made from St. John, but during the whole of the two days passed in the city we were shut up in a dense fog, and we could not wait for it to lift. So, we took cars for Shediac, (110 miles distant,) and there taking one of the "Gulf Port" steamers we sailed along the coast of New Brunswick, touching at different ports, until we came to Chatham, a small place on the river Miramichi. Our point of destination was Bathurst, and we might have reached it by steamer "Rothesay Castle" had we been able to make connections, but an attempt to do that would have involved a delay of a day or two, and time was valuable to us; moreover, we proposed, when our fishing was over, to go to Quebec, and for these two reasons we bought tickets through from St. John to Quebec, a distance, by cars and boat, of about a thousand miles. The price of these was \$16 each, (gold,) which paid for our passage, meals and staterooms included.

Arrived at Chatham, after one night's sail, we took breakfast and started at once in the mail stage for a fifty mile ride to Bathurst; the road was good and lined with trees, and the ride was a very pleasant one. At noon we reached the half-way house on the Tabusintac River. Here is the place for anybody who is not too impatient to get to his salmon river to stop and take a trip down river to try the sea trout. The owner of the house has a large "dug-out," into which he will put the party and their luggage; he will then harness to it a pair of horses (!) and away he will go down stream; where the river is shallow the horses will trot and drag the canoe over the bottom of the river, whether that be of sand or of rock; where it is deep they will swim; and so, at one moment gliding smoothly, at another thumping and bumping over the stones, the fisherman at last will reach his camping ground. Two days time is required for this trip, but let the fisherman make it three; he will thus get the evening fishing of one day, the whole of the next and the morning fishing of the third, returning that afternoon to the half-way house in season to go to Bathurst. If he shall do this, my word for it he shall get such fishing as he never had before. Every cast will take a trout, and if he uses three flies he may time and again have a fish on all at once, and every fish shall weigh at least a pound, and may weigh four. This is no fiction; the truth of it is attested by several who have been there and that it can be so, I know from personal experience on the St. Lawrence, where I have often had three large sea trout to fight at once. Let not the angler forget, either here or elsewhere in New Brunswick, his veil and his gloves with gauntlet sleeves, or his bottle of tar and oil, (equal parts each,) which is ahead of any other preparation as a *culexi-fuge*. With these, he may enjoy the sport that I have described; without them, his life will be miserable, indeed, for New Brunswick flies and mosquitoes have no superiors in the art of torturing poor mortals.

Leaving the half-way house we reached Bathurst towards evening and put up at the comfortable house of Mrs. Smith, the favorite resort of all anglers. Bathurst is situated on the Bay of Chaleurs, at the mouth of the River Nipisiguit, and is the place at which guides are taken and the last preparations made before going into the woods. We brought supplies sufficient to last our party of four the three weeks that we proposed camping out, and at noon of the day after our arrival in Bathurst we started with a two-horse wagon to drive fifteen miles through the woods to the pools at "Middle Landing" which we had previously engaged, our guides having gone before with their canoe. And now how can I better describe to you our camp and our sport than by giving you an extract from a letter written by me to a Boston paper, whilst the perfume of the hemlock boughs lingered around me and the hum of the reel, responsive to the dash of the first salmon, still vibrated in my ear. So here it is:—

"A high bluff, covered with pines and firs, looking down upon a foam-flecked stream; on the edge of the bluff, two tents with blazing fires before, and fragrant beds of hemlock within. Behind the tents, the bark 'shanty' of our

guides; between them, a rustic table with benches; on one side, a hammock swinging between two trees; on the other, a long skeleton table, or rack, on which lie salmon and trout rods with the reels carefully protected from sun and rain by birch-bark coverings; at the foot of the bluff a birch canoe. Such is our camp on the banks of the beautiful Nipisiguit, the 'Foaming Waters.'

And from our slumbers in one of those tents the voice of our 'gaffer' and guide arouses us at four o'clock in the morning, and summons us from dreams of salmon to the reality of taking one. 'Now for that salmon!' and we stumble out of our tent, rather stiff from yesterday's hard work, rubbing our eyes, and a little inclined to grumble at such early rising; but 'it is the early bird that catches the worm,' and it is the early fisherman, *usually*, who catches the fish; so we soon cheer up and follow John as he strides along, with our rod in one hand and gaff in the other, to the favorite pool. A few casts, not very confidently made (for we are new at the work,) a swirl on the surface, made by the tail of the fish, as he turns to go down with the fly, a turn of the wrist to fix the hook, and a salmon is hooked! Away he goes, with a rush, down stream, and the reel hums as the line flies out. Then he turns, and comes towards us, and quick work it is to take in the line faster than he swims, so that he may get no 'slack.' Foiled at that, up he goes into the air, once, twice, three times, in quick succession, and each time the tip of the rod is lowered as he comes out, and raised as he falls again into the water. Then he goes to the bottom, and sulks under a rock. Stones thrown in just above where his nose ought to be fail to stir him, for he is under a ledge. Ten minutes we hold a tight line, and he doesn't move. Then says our gaffer, 'He has carried your line among the rocks, and has got away. You are *fast* on bottom.' 'Guess not,' say we. 'Wade in there as far as you can, and start him up.' Then John wades slowly and cautiously in. No move from the fish. On he goes, until the water reaches his armpits, and he raises the gaff to attempt to disengage the line. *Whirr!* goes the reel, and away goes our salmon with a hundred and fifty feet of line after him, and away we go on the run down stream, over rocks and through water, up the bank and down again, determined to give him no more line than we can help. The perspiration pours from our face, and we tremble with the excitement and the unwonted exertion; we begin to doubt whether we can hold out much longer, when our fish brings us to the top of a high cliff, beyond which it is impossible to follow him. It is now 'kill or break;' the fish must come to the gaff or the line must part. But by this time the salmon begins to tire and yields more readily as the reel calls him in. Now is the time to have spectators for the sport; our loud shout calls the sleepers from their couches and they issue from their tents in every state of *undress* and sit upon the bank to see the fish killed. The tale is now soon told; a few more short runs, a last leap in the air, and he is brought slowly towards us. Our gaffer scrambles down to the foot of the cliff and holds his gaff ready; as the fish comes near he makes a dart at him and misses, and away goes the fish for another turn around the pool; but again he is checked and brought steadily up; John plunges his gaff and his arm as far as the shoulder into the water and holds up our first salmon!

'Here, John, take the rod. We'll go to breakfast.' And we return to camp at the head of a procession made up of admiring friends, the two gaffers and our cook. The fish is weighed; he kicks the beam at eleven and a half pounds—not a great weight, to be sure, but he was a very game fish, and fought us for nearly an hour, and, moreover, he was 'our first.' Having been told the day before that the salmon were taking small flies, we had tried that morning with a trout fly. 'See, John, how small a hook I took him with.' 'Yes,' says John, 'them small, little hooks is—is great!' We put that fly carefully away in our pocket-book, and have no objection to showing it.

After a three-weeks sojourn on the banks of this beautiful stream, during which we paid visits in our "birch" to the camps of brother anglers, and made a delightful trip to the Grand Falls of the Nipisiguit, where we saw the bottom *black with salmon*, we sent our traps out by wagon, and dropping down stream in the canoe, returned to Bathurst and to civilization.

The next night we took the "Rothesay Castle," and sailing further up the Bay of Chaleurs, into the Restigouche River, (the "river that speaks out like the hand,") touched at Dalhousie and stopped, a little higher up, at Campbellton. Here we took a wagon and drove to Metapedia, where we put up at Frazar's comfortable house and spent a few days fishing for sea trout in the Metapedia and the rivers flowing into it. We met there a party of gentlemen who had just finished their season's salmon fishing in the Restigouche and were returning to their homes. The novel manner in which they had lived is worth mentioning. They had a large barge, upon which had been built a comfortable cabin, supplied with berths, tables, &c.; the windows and doors were covered with mosquito nets, effectually excluding the mosquitoes, which, in a calm day or evening, found their way even out into the middle of the stream, where the barge was moved. Aft was the kitchen, so far removed from the cabin that the heat and smoke of the fires could not annoy the gentlemen. The motive power for this floating camp was the same as that used at the Tabusintac—namely, a pair of horses. By these the barge was dragged to that part of the stream where it was proposed to fish, and there it was moored fast and the fishermen threw their flies from its deck or each with his canoe and men sought a separate pool.

An amusing story was told me regarding a member of this party, which will bear repeating. This gentleman was invited to a late dinner with friends in a neighboring camp. The hour of dinner arrived, but not so our friend. A late comer reported that the delinquent had been last seen on the top of the barge cabin, playing a large salmon, and that he would probably put in an appearance before long. Everything has to give place to a salmon that shows fight. You have all heard of the Scotchman whose servant came running down to the stream where he was busy with a large fish, with the news that "the mistress was a dee-in!" and of his reply, "Tell her to hold on 'till I have landed this salmon!" So dinner was postponed and still our angler came not. At last daylight gave out and so did the patience of the dinner party. A messenger was sent after the missing man. He found him. Where? Still on the top of the barge cabin, surrounded by lighted candles, with his wife standing bravely by his side and waving about her husband's head her *flannel petticoat* to keep off the mosquitoes, whilst he continued to fight that same identical salmon! It is due to the perseverance of the gentleman and the heroism of the lady to say that they landed him!

From Metapedia, we drove back to Campbellton, and no wishing to wait for the steamer, took a sail boat back to Dalhousie. This is a pleasant little village, surrounded by beautiful scenery and having plenty of good trout fishing within easy reach. That night we again took passage on one of the "Gulf Port Steamers," and sailing out of the Restigouche and coasting along that part of Lower Canada which lies between the Restigouche and the St. Lawrence, stopping at New Carlisle, Percé, (where is the famous Percé Rock,) and Gaspé, entered the River St. Lawrence; and after a delightful sail of two days and two nights from Dalhousie, during which we were content to lie about the vessel and rest after our labors, we reached Quebec and our fishing trip was over.

W. E. F.

Boston, June 14, 1874.

The Horse and the Course.

JEROME PARK RACES.—On Saturday last the largest number of people ever brought together at Jerome Park were assembled. The grand event of the day was the race for the Belmont stakes. Distance, a mile and a half. Entries, nine.

First Race, Belmont stakes for three year olds—Won by Saxon, by a neck; Grimstead second, Pennington third. Time, 2.39½.

Second Race, for two year olds, a dash of half a mile. Won by Mecca, by a head, Lizzie R. second, Amelia third. Time, 50½ seconds.

Third Race.—Dash of mile and a half. Won by Bingaman, Merodac second, Red Duck third. Time, 2.40½.

Fourth Race—Mile heats. Won by Katy, a good length ahead, in 1.44; Jury second.

Fifth Race.—Steeplechase, an extra event, the winner to receive a silver plate presented by Miss J. G. Bennett, G. P. Wetmore, and Leonard Jerome. Distance 2½ miles. Won by George West, wonderfully well ridden by Gaffney, in 5.36, distancing his competitors Bullet, Mary Clark, and Henrietta.

On Tuesday the Park was again crowded with spectators, and there were four spirited contests, of which the following is a summary:—

First Race—Ladies' stake—One mile and a half. Five entries; won by Cottrill's Bonaventure in 2.42; Lava second.

Second Race—Dash of a mile and a quarter; nine entries; won by Sanford's Preakness in 2.12; Cordelia second; Resolute third.

Third Race—Mile and three quarters; five entries; won by McDaniel's Springbox in 3.14½; Mate second; Fellowcraft third.

Fourth Race—Handicap Hurdle Race—Mile and three quarters, over seven hurdles; three entries; won by Hitchcock's Livingstone in 3.26; Victor second.

—On Monday last the new half mile track of the "West Side Park" was opened at the foot of Duncan Avenue, in Jersey City. First race was for horses that had never beaten 3.20. There were twelve entries, mile heats, best three in five, under harness; won by Mace's Midget. A second race for horses which had never made 2.38, was next in order, which was won by P. Manes' Phil O'Neil, in 2.42½, 2.40½, and 2.43½.

—At Philadelphia, on the 15th of June, at Suffolk Park, a race came off between Goldsmith Maid and Nettie. Mile heats, best three in five. Won by Goldsmith Maid. Best time of the maid, 2.23.

—The black stallion Strideaway, the famous trotter owned by Keeler, Wright, and Shumway, and valued at \$25,000, died of disease at a stable in Providence, on Monday.

—Last week at the Richmond club grounds, New Dorp, Staten Island, an exciting race took place. Three horses entered, best three in five to harness; ¾ mile heats. Uncle Bill, 1 1 2 2 1; Lady Woods, 2 2 1 1 3; New Burling Girl, 3 3 3 3 2. Time—2 min., 1.59½, 1.56, 1.57, 1.59.

—At Boston, on June 13th, a race took place over the Beacon Park, between American Girl and Copperbottom, a pacer, both in harness, and Lucilla Goldust under saddle, for \$2,000. Mile heats, best three in five. Lucilla won the first heat in 2.27, American Girl the second in 2.25½, and she won the third and fourth heats in 2.27½ and 2.26.

—In Paris, France, on the 14th, the *Grand Prix de Paris* was won by the English Colt, Trent, fourteen horses running.

—We are indebted to Major George J. Allen, U. S. Signal Officer at New Smyrna, Florida, for meteorological record for May—latitude 29 deg. 02 min., longitude 80 deg. 54 min.—from which we learn that the lowest temperature for the month was 62 deg., highest 94 deg., mean mid-day temperature 88 deg. Amount of rainfall about four inches.

—A quaint old fisherman along toward dusk, was fishing in a trout stream, and as he flung his fly over the water, it was suddenly snapped by a large bat. The strange-looking thing dangled and flapped its wings at the end of the line. The fisherman's companion called out: Say, Sam, got anything?" "Ye as," looking at the bat on his hook. "What is it?" "I dunno, unless its a cherubim!"

—We clip the following item from an exchange:—

A lot of rats were found the other day in a hogshedd that had been left open in a store in Exeter, N. H. The store cat, having been notified, climbed to the edge of the hogshedd, but, after surveying the situation, jumped down and ran out at the door, shortly reappearing with another cat. The two looked at their foes and retired, soon coming back with a third cat. They now seemed satisfied with their force and made an attack, jumping into the hogshedd. The cats miscalculated the force of their enemy, two were killed, one being taken out in season to save its life.

THE FROGS.

BY MRS. EUNICE B. LAMBERTON.

WILL you listen to the peeping
of the frogs,
As they chant a loud hosannah
from the bogs?

Can you tell me what their gurgling
throats would say,
To the plodder on his dusty,
weary way?

Do they lessons with their hnsky
pens give,
Of thanksgiving for the simple
right to live?

Are they croaking to each other
as they moan,
With exultings in a language
all their own?

Tell they, rasping, of the vani-
ty of life,
With its flickerings, its buffet-
ings, its strife?

Sit they, puffing like a mighty
mass of men,
That in halls of state assemble
now and then,

Spouting forth unique opinions,
wondrous wise;
Throwing dust *ad infinitum*
in the eyes

Of the biggest frog among them,
most erect,
Making riot in all frogdom
circumspect?

Does the spirit of rebellion
move in force,
Till they scream their little bursting
windpipes hoarse?

Do they wail a sad and mono-
tone lament
For the hours in idle dissi-
pation spent?

Are they laughing at the thought of
boozy frogs
Reeling homeward, all a straddle
o'er the logs?

Tell, O tell me, ye who hold the
magic key
To this weird and complicated
mystery,

Where, O where, is this profound and
wide domain?
Will one solemn frog arise and
all explain?

Rochester, N. Y., 1874.

Fish Culture.

This Journal is the Official Organ of the Fish Cultur-
ists' Association.

SHAD IN LAKE ONTARIO.—It was a novel and bold idea of the Fish Commissioners to attempt to propagate shad in our great fresh water lakes, but the success thus far attained leaves no doubt of the practicability of the experiment. The St. Catharines' News, of Canada, says that large quantities of these fish are now being caught at Port Dalhousie on the north side of Lake Ontario, and quite a number have been taken in nets at other points. Last Friday a shad nine inches long and weighing a quarter of a pound was taken with a fly from the end of the pier at Oswego by Henry G. Gardner, Esq., and on the Monday following a full grown shad weighing 4½ pounds was caught at Cape Vincent, and forwarded to Seth Green at Rochester. Some time ago Mr. Green offered a prize of \$25 to the first person who should catch a shad in Lake Ontario, weighing over three pounds. This is the first one caught that comes up to that standard. It appears that these fish not only grow nicely, but they scatter from their native rivers to all parts of the lake. A correspondent of ours who was with Mr. Gardner when he took his shad regrets that he cannot give with certainty the fly taken by this new denizen of Ontario, as the fish dropped from a cast of three flies before he could see which one had hooked him. Doubtless fly fishing for shad will become at once a popular pastime in the lake. Speaking of this shad, Mr. Green says in a private note to us:—

He weighed 4½ lbs. Four years ago I put 1,000 young shad in the Genesee River, three years ago 15,000, two years ago 100,000, and last year 300,000. The one and two year old have been caught in great numbers. This is the first full grown shad ever caught in Lake Ontario. I had him for breakfast. He was a \$25 shad, the premium I offered for the first caught weighing over three pounds.

SETH GREEN.

THE AQUARIUM CAR.—We are in receipt of a most interesting letter in regard to the Aquarium Car addressed to us by Miss Francis W. Webber, Mr. Livingston Stone's most intelligent Superintendent, who has now under her care Cold Spring Trout Ponds, at Charlestown, N. H. We hope soon to receive intelligence from California of its arrival and the satisfactory disposition of its contents. As Miss Webber has held for the last two years the important position of Superintendent, there is no doubt but that Mr. Livingston Stone's interests will be properly attended to in his absence at California. It is a distinction to find a lady taking prominence in the catalogue of American fish-culturists.

When the California Aquarium Car reached Niles, Michigan, on 6th June, Mr. George H. Gerome, the indefatigable Fish Commissioner of the State, contributed to the collection forty of the unrivalled St. Joseph's black bass, the same being, (to use Mr. G's own language conveyed in a private note to us,) "Michigan's slight but cheerful testimonial of gratitude and thanks for California's last year's most munificent gift of 80,000 salmon."

MARYLAND FISH CULTURE.—In the Baltimore American of last week, we notice an excellent article on fish culture. Starting back with the pagan history of the art of fish raising, telling of the famous Dom Pichon, the patron Saint undoubtedly of the science, telling us about Jacobi, and Remny and Coste, it takes us from the past to the present condition of fish raising in different portions of the United States, and more especially in the State of Maryland. It was twenty years ago, we are told, that Alban G. Stabler and J. P. Dukehart, together with Forsyth and Shriver brought a small lot of black bass in the tender of a locomotive from Wheeling Creek, West Virginia, and put them in the Potomac. From this small beginning, as has been before noticed by us, sprang the noble race of fish which now swarm in the river. The leading fish-culturist at present in the State of Maryland is Alexander Kent, Esq., whose fish ponds at Green Spring Valley are admirable of their kind, and whose success has been marvellous. Mr. Kent's three ponds are fed by a spring having a discharge of 2,000 gallons a minute. The hatching house is 40 by 32 feet, in which are 32 hatching boxes 12 feet long. The location of Mr. Kent's ponds, the Baltimore American says, is a beautiful one, surrounded on all sides by magnificent scenery. All the fish in the ponds, some 6,500 trout, owe their origin to fish caught by Mr. Kent himself in the Blackwater, the head waters of the Cheat River, whose beautiful banks Porte Crayon and the late John P. Kennedy have immortalized.

—Four years ago Cayuga Lake was wholly depleted of the fine trout with which it once abounded; but a jealous protection of the half million fry and spawn planted there in 1870 has wrought wondrous results, and now anglers bring in daily fine strings of fish, and boast that their waters surpass all other fishing grounds. This will be gratifying intelligence not alone to anglers in the immediate vicinity of Cayuga Lake, but throughout the State, and to all who are interested in fish culture throughout the country.

—The new rooms of the Massachusetts Anglers' Association in Baldwin Building, 368 Washington street, Boston, were formally opened last week, its President, Dr. Ordway, in the chair. The quarters are very nicely fitted up with Brussels carpet, desks, settees, &c.; a beautiful clock adorns the wall at the rear end of the room, and the charter of the association, handsomely engrossed on parchment and framed, hangs on one of the side walls. In one of the front corners of the room is placed a fine bust of the late Prof. Agassiz, resting upon an elegant pedestal, rich in finish and tasteful in design. Twenty-two new members were admitted, and the number is increased at every meeting. We congratulate this efficient society upon its success thus far and the enlargement of its sphere of usefulness. This journal is pledged to its support.

—Week before last Mr. Andrew Pierce, of Claremont, New Hampshire, caught a plump fat bass, which weighed one pound and nine ounces. He caught it in Sugar River, just below the dam at West Claremont, where, we are told are "many more of the same sort." They doubtless came up, or down, the Connecticut, in the tributaries of which our Fish Commissioners have been at work.

—The Calais (Maine) Times says that over twenty salmon and trout weighing from one to six pounds were caught by a gentleman, one day last week, at the mouth of the brook in which the fish Commissioners put the young salmon, in Vanceboro, last year.

—Seth Green, Esq., sends the following letter:—

LITTLE FALLS, June 8, 1874.

SETH GREEN, Esq.:—

In January last you sent us 3,000 California salmon for the Mohawk River at this place, and on Friday last, the 5th, Mr. Richard Casler caught one of them with a hook and line measuring about five inches long. We are now satisfied that they will do well here. Knowing that you would be pleased to hear from your little ones I take the pleasure of informing you.

JAMES M. SMITH.

The California salmon hatched in January are as large now as the Maine salmon are at one year old last March. I never have taken care of any fish that gave me so little trouble and grow so fast as the California salmon.

Yours,

SETH GREEN.

—A car containing live oysters and lobsters arrived at Ogden, Utah, last week, and an attempt will be made to propagate them in Great Salt Lake.

—Mr. James W. Hayden, proprietor of the Squantum Beach House, Squantum, Mass., a short time since captured a baby seal on the marsh near his house, which he is now raising by hand. The little fellow shows considerable affection for its keepers, will follow them like a dog, and in fact has become quite an attraction. Another seal was caught at Spring Hill, Mass., by George Hoxie last week; these instances indicating a possible return of the seals to old haunts along shore, long since deserted.

—The Cape Ann Advertiser says that occasionally a halibut or codfish is brought in which has a watery, sickly, dropsical appearance. In nearly every instance where they have been opened, the cause of their sickness is found to be the swallowing of fish-hooks which they have bitten off of trawls.

Natural History.

QUAIL BRED AND BREEDING IN THE CITY.—A few days ago we had the pleasure of seeing the nests of two pairs of quails in this city, one containing eight eggs the other five. The birds are enclosed in a large galvanized iron frame running all the length of the yard, wherein is planted small pines, flowers, &c., so as to give the birds cover and hiding places when they hatch. These quail are now breeding in the yard of a gentleman field sportsman who has been amusing himself for the last three years in trying the experiment of breeding quail in the city. He has succeeded in raising large broods for two seasons and bids fair to add a third term to his success. The birds are all hearty and doing well, and we are authorized to say that any gentleman wishing to see them and their nests, either as a matter of curiosity or for practical purposes in the way of breeding, in order to gain such information as to be able to stock a locality from a single pair, can call at 86 Clinton Place, and the servants are directed to show them to any person desiring to see them, also to give all the practical information that has been acquired concerning the proper treatment of the birds at and before breeding time. Perhaps eight or ten pair might be turned loose in a season and the original pair still kept breeding in confinement until the requisite number for fairly stocking a neighborhood was produced.

A FLOATING MENAGERIE.—It is stated that a party of army officers, who have been engaged in mounting guns and otherwise putting the Gulf forts in serviceable condition, while sailing through Mississippi Sound, since the recent flood, encountered a remarkable scene. For miles were seen logs, driftwood and patches of turf and soil floating out into the gulf, filled with live animals, who clung to their frail barques with the tenacity of shipwrecked mariners. Among the animals were seen rats, raccoons, possums, rabbits, alligators and moccasin snakes in uncounted numbers, all brought down from the swamps and marshes, perhaps from fifty to one hundred miles inland. The novel exhibition had a scientific interest, as it suggested the manner in which, during past geological periods, animals were transported from regions far inland to the mouths of estuaries, and their bones being entombed in the silt and soft mud, furnished the organic remains which are preserved for ages in the hardened strata. It was, doubtless, by similar means that the fossils now found in the solid limestones were engulfed and preserved; and also that animal life has been distributed over portions of the globe.

—Boston Journal.

TARPUM.

UNIVERSITY MUSEUM,
MIDDLETOWN, Conn., June 11, 1874.

EDITOR FOREST AND STREAM:—

I notice in your issue of the 28th ult. (page 252), a communication from Mr. S. C. Clarke, of New Smyrna, Fla., concerning certain large fishes of the eastern Florida coast. The Tarpum is doubtless *Megalops thrissoides* (Bloch-Schneider) Gunther, which occurs occasionally in the waters of the West Indies and of the east coast of the United States. Its affinities are with the shad and herring family (*Clupeidae*) rather than with the mackerel family, as Mr. Clarke supposed. It may at once be known by its enormous silvery scales, often two inches in diameter, and by the great prolongation of the last spine of the back fin. I have seen the fish in the Bermudas, where specimens measuring five feet are sometimes taken. It is known there by the name "Tarpum" and at Barbados by the somewhat similar "Caffum." These names have a singularly barbaric sound, and as they are only in use in American waters they may very possibly be the names by which they were known to the aborigines. Mr. Clarke says that he finds these names in Captain Roman's "Concise Natural History of Florida." I hope he will throw some additional light on this interesting question of names, by informing us whether the name "Tarpum" is at the present time used by the Florida fishermen. *Megalops thrissoides* is sometimes taken in the St. Johns River and brought to the Jacksonville market. Its scales are kept for sale in all the curiosity shops, and are much sought after by ladies who make from them and the scales of smaller fishes very pretty sprays of fancy flowers. The St. Johns fishermen know the fish as the "Jew-fish." The "Jew-fish" mentioned by Mr. Clarke, I judge from his description to belong to the old genus *Serranus*, and would probably not be classed under Professor Gill's *Trisopterus* or *Epinephelus*. The name "Grouper" is variously applied at different points in the West Indies, but usually is attached to some member of the genus *Epinephelus*. The "Grouper" of the St. Johns is quite different, being a much shorter, higher and heavier fish, with large, smooth, pearly scales; it is known in the New York market as the "Flasher" (*Lobotes surinamensis*—Cuv.), and occurs as far north as the Vineyard Sound, where it was taken by the United States Fish Commission in 1874.

G. BROWN GOODE.

HONEYE FALLS, N. Y., June 8, 1874.

EDITOR FOREST AND STREAM:—

The picture of the Grayling in your issue of the 4th is perfect. Mr. Forbes has got his likeness "to a spot." The first picture of a Grayling that I ever saw was in Webster's Unabridged, where it has scales like an armadillo and no second dorsal fin. Now a poor picture is worse than none, and the illustrations of fish in this dictionary are from old cuts, mostly of foreign fish. (See the mullet.) I don't know where they got that cut of a mullet with two dorsals. The only other cuts of a Grayling I have ever seen are in Sir Humphrey Davy's "Salmonia," and if they are good representations of the English fish of that name they bear no resemblance to ours, as the eye is small, and the outlines of the first dorsal sharp and square. Your picture puts the fish squarely before the eyes of the public, who have no opportunity to see the fish itself, and they can judge for themselves if it be "a variety of scisco," or "a cross between a herring and a perch!" The last idea is brilliant; yet how many there are, men who have been among fish all their lives, too, that do not seem to know that animals, to cross, must have the same physical structure, and even then the progeny are unfertile, and that to try to cross a fish with soft fins like the herring, with one that has sharp rays like a perch, would be as absurd as to try to cross a humming-bird with a snapping turtle.

FRED. MATHER.

CENTRAL PARK MENAGERIE.

Animals received at Central Park Menagerie for the week ending June 13, 1874.

One Blotched Genet, *Genetta tigrina*. Hab. South Africa. Presented by Mr. P. Mooney.

One grey Squirrel, *Sciurus carolinensis*. Presented by Mr. Isadore Isaacs.

One Collard Peccary, *Dicotyles tajacu*. Presented by Capt. S. P. Griffin, steamship Colon.

One Moose, *Alces macchitis*; female placed on exhibition.

One Spider Monkey, *Ateles belzebuth*.

One Ocelot, *Felis pardalis*.

Three Black Wolves, *Canis occidentalis*, var. *ater*. Bred in the Menagerie.

W. A. CONKLIN.

Woodland, Lawn and Garden.

ROSE CULTURE, ETC.

The angel whispered to the rose:
 "O, fondest object of my care,
 Still fairest found where all are fair;
 For the sweet shade thou givest to me
 Ask what thou wilt, 'tis granted thee."
 "Then" said the rose, with deepened glow,
 "On me another grace bestow."
 The spirit paused in deepened thought—
 What grace was there the flower had not?
 'Twas but a moment—o'er the rose
 A veil of moss the angel throws,
 And robed in Nature's simplest weed
 Could there a flower that rose exceed?

KRUMMACHER.

WITH this paper we close for the present our remarks upon roses, although much might be written and spoken upon this interesting and voluminous subject, which has been a favorite one with the florist and amateur gardener for many years. The cultivation of the rose, as time advances, becomes more and more an object of particular attraction, for every year develops something new in the realms of floriculture. Of such boundless extent has the family of the rose plant become, that one could not name the endless varieties offered for sale in any of our large cities. It were a far more difficult task to particularize and classify all the hybrids, shoots, and even new species. Having before spoken of some of the best varieties for cultivation, it were well to notice here some of the natural laws which govern their life and culture. The time was when many roses were very indifferent, and considered as worthless, having, when in flower, a few meagre single blossoms, and were pulled up and thrown aside as good for nothing. Many of our best roses of to-day were produced on these very roots, and from offshoots of the same condemned varieties. I have had nineteen varieties of the rose, and some of them very perfect and fine flowers, before me at one time, many of which were the result of a patient continuance of hybridizing and careful culture. The most of these roses can be quite easily commanded by any one who has patience, taste, and a passionate love for flowers. Unless you have considerable of these qualities, with much perseverance, you had better let rose culture entirely alone, and for your bouquet cut off a handful of apple tree blossoms.

In this list of roses I had colors of many kinds—the pure white, the dark crimson, the purple, the striped, and the yellow—and many of them were climbers. Some of them would make good strong cones twenty to thirty feet in height in one season. Never reject a rose as worthless until you have cultivated it at least three seasons, for it is not at all uncommon for a very unpromising rose of the first season to develop in the third season to a perfect flower. I received from a friend on the western prairies some twenty years ago a box containing some sixteen good strong plants of what he called the different kinds of prairie rose. I planted them all out with much care, and was greatly troubled at the season of their blossoming to find I had a poor, undeveloped, ill-shaped, pinkish blossom on some stalks, and a whitish cluster of what I called very poor flowers on others. I was almost determined to root them up and throw them away, but upon a closer examination I was led to the opinion that plants that bore such remarkably fine, glossy foliage, should bear a fine blossom, and as my friend did not send me a word as to the qualities of his present, I came to the conclusion to give them another year of probation. I pruned them closely, and in every way gave them the treatment I have heretofore recommended. The second year they gave me a much better show, and instead of a single row of small leaves I had a large leaf of the flower a finer color, and in many of my plants I had a double row of leaves. I continued the same treatment the third year with increasing encouragement. I found what I had very hastily condemned as good-for-nothings were indeed first class plants, and every way deserving my attention. Among the best plants that grow in my garden at this writing is one of these same roses, upon whose prolific cones I have cut a single bouquet of roses from one stem, which contains from ten to twenty buds, and blossoms of a very fragrant, deep, pink, prairie rose. In fact, this one plant has been the parent of many roses growing in other gardens in my near vicinity. Therefore, never hastily discard a plant because it often takes several years to fully develop its true worth.

The best climbing roses are Madam D'Arbly, Baltimore Belle, Phillipar, and Gillroy. This last is a beautiful rose, violet shaded, large size, with always a good growing habit. In bud it is magnificent, but when in full flower its color soon pales. It is a running rose, and is well adapted for pillar cultivation and cemeteries. For a selection for a small garden I have frequently recommended, and always with satisfaction to the grower, for they are very fragrant, the Prince Albert, crimson perpetual, common red, and white moss, always beautiful, and easily grafted on sweet briar stocks; the "old cabbage" rose, known from the days of our grandmothers; crested Province, and souvenir de Malmaison. You can add to these *ad libitum*, but you can find none more reliable and worthy your care than the above named.

I could very easily give my readers selections from a list of upwards of a thousand roses, and many of them very fine indeed, and worthy of the study of the florist and amateur, but I do not deem it necessary in this place to growers of small collections. A small selection to commence with will be found the best, as rose cultivation will grow

on your hands. If you cultivate in a private garden, none but the best should be cultivated. If you grow for bouquets and sale, a larger collection will not come amiss.

A few general hints will close this paper on roses. You should aim always to obtain good strong plants. If your plant is very full and bushy, cut away all the weaker branches (if you do not own a pair of trimming scissors go and buy a pair), leaving four or five, never more than six, of the strongest shoots, and shorten these to three or four buds. Do not be afraid to do it, as it is the only way to obtain fine, strong plants, and fine, well developed flowers. At this period, if you wish for a dwarf plant, you will cut down to the last two eyes of the new wood, and leave no half grown or weak shoots. If you still find that you have more branches or cones than you wish for, cut away one half of them, always removing the weakest ones, and so thin them out as to give them all the room you can. Remember once and always that rose trees and bushes are very easily spoiled, and become worthless by bearing too much wood.

I received a letter from a rose culturist once with the request that I would tell him what ailed his roses. I seriously believed I had a blight, or some such enemy to fight, but on examination I found his plants suffering from this very error—of letting his rose plants bear too much wood, and thereby exhausting themselves. I recommended Dr. Scissors—a remedy which, carefully applied, gave him an illustration of my meaning on the spot, and the next season, after the application of the necessary pruning, a splendid blossom of strong plants rewarded the grower.

A word or two upon the cultivation of the standard rose—now quite the fashion in good gardens—may not be out of place here (a full account of the treatment of standards will be found in a work upon rose culture, soon to be published by Ollipod Quill). I give an extract:—"Standard roses, to give a pleasing effect in the garden, should be as near perfect as is possible to make them. To have a standard rose truly handsome it should be as wide in what is termed the head, or bouquet, as its entire height. By a correct and very careful system of rose standard pruning it is very possible to produce fine plants, as they enlarge a little every year, but do not always give the desired shape and comeliness. Remember, that for all kinds of roses spring is the best time in which to prune. Set out your standards as early as you please in the place in which they are to stand, and be very sure not to touch them until quite late in April; then you should cut all the small shoots close off, and shorten the strong ones to three or four eyes, and always leave the eyes upon the top of the branch, the uppermost pointing upwards and outwards. Make a clean, smooth cut. This kind of pruning is the only sure guide to a beautiful rose tree. Now your work for the future is comparatively easy; but remember, you must do it according to this rule, or you will fail entirely in producing a fine rose tree. As the new shoots put forth you will carefully select from among them the best and strongest, and which grow in the right direction to widen the head, and let those shoots make all the growth they will. Any shoot that is growing from the centre upwards treat in the same manner; rub off or cut off with a sharp knife all weak shoots, as well as all that cross each other or grow inward, and be sure always to remove the weakest. You will find by this treatment that you will have all the wood you want, and one or two seasons of practice and observation will give you not only knowledge, but assurance in your own ability. You will have found by this time that one season does not give you material for a full and finished tree, or a "full head." The next season you will shorten these branches half their length, being very careful to leave the end bud, or under bud, as you well know that rose shoots always grow upwards. In the second and after seasons look well to your new wood, and cut out all those branches that crowd or cross each other. These are found to be young and tender branches, and easily removed. Rub off all the buds you do not want, and proceed in this manner year by year, and you will form a tree that will astonish yourself as much as gratify your friends. When this state is reached you will only have to cut back to two eyes every season, and remove the weak wood. Do not be afraid to use the pruning knife and scissors."

By following the above rules, you can own your rose trees not only for one short season, but for ten years, as you can lift them and secure them from cold, and always rejoice in the work of your own hands.

OLLIPOD QUILL.

ANSWERS TO ENQUIRERS.—Burton, of Pennsylvania.—The prominent or principal feature in garden scenery, particularly landscape gardens, should never be allowed to introduce a monotonous style in the subordinate characteristics of the grounds. You will always observe some one point from the windows looking from the principal rooms, or from some prominent elevation near the house, from which a pleasing view is always obtained of the garden as a whole. Give this your especial attention. We suppose this site of which you speak to be elevated, as it should be, above the surface of the garden, looking, we will suppose, from a terrace, over the various parts of which your garden is composed—as lawns, thimbleberries, single specimens and groups of shrubs, or trees and flowers and garden ornaments, all should so combine as to blend in one harmonious whole. Symmetry is not formality. O. Q.

Constant Reader.—In answer to your enquiry, "What soil is best adapted for the growth of the Japan and Spanish lily?" I would say, these splendid new varieties can be successfully cultivated either by potting or open ground

cultivation. The best way is always to start the bulbs by a gentle heat, having placed them in pots filled with fine soil. Two parts of earth from an old hotbed, composed of leaves and horse manure, two years old if you can obtain it, one part rotten sods, or good yellow loam, and one part sandy peat; if your peat does not contain sand add a small quantity. You can get your bulbs potted as above at any good florists by giving your order, and save time and money. We always start in pots and transfer to open ground. O. Q.

BEST TIME TO PAINT HOUSES.—The *Technologist*, a good authority, states that paint applied to the exterior of buildings in autumn or winter will endure twice as long as when applied in early summer or in hot weather. In the former it dries slowly and becomes hard, like a glazed surface, not easily affected afterward by the weather, or worn off by the beating of storms. But in very hot weather the oil in the paint soaks into the wood at once, as in a sponge, leaving the lead nearly dry and ready to crumble off. This last difficulty, however, might in a measure be guarded against, though at an increased expense, by first going over the surface with raw oil. Furthermore, by painting in cold weather you escape the annoyance of small flies, which invariably collect during the warm season on fresh paint.

—The following from the *Brisbane Courier* (Australia), if credited, shows that in Queensland our famous Yosemite trees are eclipsed:—While cutting a given line on the banks of the river Johnstone, for the purpose of examining the land, an enormous fig tree stood in the way, far exceeding in stoutness and grandeur the renowned forest giants of California and Victoria. Three feet from the ground it measured 150 feet in circumference; at fifty-five feet, where it sent forth giant branches, the stem was nearly eighty feet in circumference.

Sea and River Fishing.

FISH IN SEASON IN JUNE.

Salmon, <i>Salmo Salar</i> .	Salmon trout, <i>Salmo confinis</i> .
Trout, <i>Salmo fontinalis</i> .	Shad, <i>Alosa</i> .
Land-locked Salmon, <i>Salmo gloveri</i> .	Michigan Grayling, <i>Thymallus tricolor</i> .
Black Bass, <i>Micropterus salmoides</i> .	<i>Micropterus nigricans</i> .
Striped Bass, <i>Roccus lineatus</i> .	Sea trout, <i>Salmo immaculatus</i> .
Bluefish, <i>temnodon saltator</i> .	Weakfish.

The harvest of the sea is not to be supposed more plentiful this year than usual, but the methods of transportation being increased, fish find their way in quantity to New York, where there exists an active demand. Salmon are more abundant, and sell at thirty-five cents a pound. The greater proportion comes from Canada; the Penobscot fish are still rare. The Montreal fish weigh from twenty to thirty-five pounds; the Maine fish hardly over half that. The Penobscot fish are worth, however, fully ten cents a pound more. The daily supply may be estimated at about 5,000 pounds; this will increase now every day until in July, this quantity will double, and salmon will be worth twenty-five cents a pound.

Looking over a New Orleans market report we find that pompinos are about the same price there as in New York, from seventy-five cents to \$1 a pound. Mackerel fine, but falling off in size—some coming from the coast of Long Island. Bass not quite as plentiful—still, those that come are giants. Blue fish not over abundant, but much larger, turning the scales at fourteen pounds. Spanish mackerel are arriving from Norfolk; some few stragglers, the advance guard, have been caught north of the Chesapeake. Real wild trout, the products of the innumerable streams of Canada, are now being caught by Indians and sent into market. Mr. Blackford makes a specialty of this business. We noticed that most of the large trout had *no eyes*, the Indians having used them for bait. These fish supply Saratoga and Long Branch, and go off like hot cakes at fifty cents a pound.

Civilization and frog-eating go undoubtedly hand in hand. With frogs or diamonds, it is simply a question of supply and demand. When public taste demands frogs in quantity frogs are found, and to-day no little supper is absolutely complete without its dish of frogs. Americans have for a distinguishing trait their assimilating qualities, and we eat frogs now with the avidity of Frenchmen. The mastodon breed—the *giganticus*—comes from Cape Vincent, in this State. Hind quarters, with the ribs, are fully eight inches long and are worth fifty cents a pound. Fully 500 pounds come into the market every day. Shad are now scarce, and on the 20th of June the law forbids their being caught in Connecticut. Flounders, or flukes, in abundance, only six cents a pound. This fish has an unfortunate name. If only Philippe were here in New York ready to convert the despised fluke into *une sole a la Normande*! Sheepheads in abundance.

Our attention was particularly called to an article published last Sunday, June 14th, in one of our leading papers, headed "Decayed Fish." We feel certain that the information upon which it was written was in error. It suggested the idea that large quantities of unwholesome fish were sold in the city. Careful enquiry in regard to this matter shows that the greatest care is taken not to put spoiled fish on the market. The quantity of bad fish found in the markets varies with the weather from 10,000 to 100,000 pounds a week. At no time since the opening of this fish season has it been 60,000 pounds. We are not exactly prepared to make the assertion, but it seems as if there is a wrangle at present between the Corporation official contractor, who charges the fish dealers some price to remove the bad fish, and a private party who is willing to pay for the fish offal and who finds a profit in converting it into fertilizers. Colonel Devoe, the Superintendent of the markets, is in-

defatigable, and his vigilance in order to prevent the showing of bad food on the public, is unceasing. In these times of hydrophobia and dyptheria seares, to get up a fish panic when there is no just cause for it, is as vexatious as it is harmful.

Last week, at the request of Professor Baird, some half dozen of the finest of our shad were carefully packed in ice and sent to Professor Peters, of Berlin, for examination.

—Fishing at Mollychunkamunk and the Rangely Lakes, in Maine, has begun in good earnest. A score of the members of the Oquossoc Club have gone there with their friends, and already we begin to receive reports of five and six pound trout taken, specimens of which occasionally reach this city packed in ice and grass. The Oquossos own a camp and territorial rights and privileges at Rangely Lakes.

—Splendid messes of trout are daily taken from the mountain streams and brooks in the vicinity of Gorham, New Hampshire.

—The first trout ever caught in Wenham Lake, in Massachusetts, was taken from thence a few days since. It weighed two pounds.

—Captain John M. Taylor, field editor of the FOREST AND STREAM, and A. C. Lawrence, Esq., of New York, left on Monday last for Cape Breton. They will fish for salmon on the Margaree River.

—Messrs. T. R. Proctor, Thomas Van Embergh and C. W. Hutchinson, of Utica, have gone to the Adirondacks.

—The Utica *Herald* notes the return last week from Raquette River of a party of Iion gentlemen, with a butter-tub full of fine trout, forty of which weighed fifty pounds, and eight of the number from 1½ to 3 pounds. This is certainly good evidence that the pickerel have not driven the trout entirely out of the Raquette.

—Here is a short message from Malone, New York:—

MALONE, NEW YORK, June 13th, 1874.

EDITOR FOREST AND STREAM:—

We are having lively times now. Sportsmen from every quarter are flocking into town, partaking of "Sandy" Flannagan's hospitality for a breathing spell prior to their departure for the happy fishing grounds. Our enterprising livery men, Tobey and Chisholm, are running a line of Concord coaches to Duane, fifteen miles south of here, connecting at that point with Pol Smith's stages for all interior resorts of any note, the increased patronage of this route within a year or so demanding extra carrying accommodation. Fishing is particularly good at Lake Meacham, twenty-five miles, on stage road. This is a beautiful resort, and parties who delight to "cast their lines in pleasant places" need go no further. Of Paul Smith's, Martin's, Bartlett's, and others, now famous, I need not speak. All are easily accessible over an improved highway at reasonable rates from this most desirable "jumping off" place. At "Slate Dam," fourteen miles, is another point not to be overlooked by the sportsman who wishes to absorb every locality where it will pay to wet a line. A few days with "Rags" Cunningham, on the upper Salmon River and at Round Pond, not forgetting charming little Charlie Pond, will prove highly satisfactory. Arrangements have recently been made with the railroad lines east of here to sell coupon tickets from Boston, New York, Philadelphia, and all the principal cities directly through to the Adirondacks, *via* Malone, at reduced rates. This will be interesting to your readers who intend "doing" the North Woods this summer.

H. E. CANTWELL.

TROUT STREAMS OF VERMONT.

WESTON, VT., June 8, 1874.

EDITOR FOREST AND STREAM:—

Trouting is now good. Have been out several times with good success. This section is in the heart of the Green Mountains, and abounding in trout streams that are easily accessible from the village and visited by but few besides the resident anglers. In the main streams the trout are of fair size. Then there is the Cold Spring Reservoir, literally swarming with fine, large trout, but except in the first of the open season they will not answer a summons every day. I do not affect them much, as they are not game like the trout. The most of the anglers from abroad visit the reservoir, for when they are in the humor they afford a full creel. Weston is 12 miles from Chester, a station on the Rutland and Burlington Railroad, and connected by daily stage and can be reached the same day from Boston or Troy, N. Y. The hotel was recently destroyed by fire, yet the people of the village kindly and very reasonably care for small parties. There are also plenty of accomplished and gentlemanly anglers to act as guides, notably Messrs. Wm. Holden and H. B. Rogers, who are *au fait* in all that pertains to rod and gun, and own craft upon the aforesaid reservoir.

While on the subject I will say that the Battenkill, on the west side of the mountain and running through Manchester, Sunderland and Arlington, is a famous trout stream, coursing through the open meadows most of the way, affording the finest sport for casting, as the deponent can testify from personal knowledge. Then the fish are large and gamey. The stream is greatly fished but still the supply is kept up. In the towns mentioned are capital hostleries, notably the Elm House, at Manchester, kept by my friend C. F. Orvis, the maker of the best cheap rods I know of, and himself the most accomplished fly fisherman in the State, ever courteous and ready to put his guests in the way of securing a full measure of sport with rod or gun. Yours very truly,

C. L. WHITMAN.

FLY PREVENTIVES.

PHILADELPHIA, June 12, 1874.

EDITOR FOREST AND STREAM:—

In the last issue of the FOREST AND STREAM, I noticed that one of your readers inquires for a remedy for black flies, gnats, &c. In answer, I would say that carbolic acid soap is one of the best articles that can be had to keep off troublesome insects; and it is true that the odor of carbolic acid is not the most delicate perfume for refined noses, but being a disinfectant also, will neutralize any noxious vapor that may arise in the low, swampy grounds. A great deal of carbolic acid is used for this purpose by the engineers in the Red River country, where the mosquitoes can be measured out by the cart load.

Another remedy is to make an ointment of mutton suet and oil of pennyroyal, or make a mixture of tar and sweet oil. This can be washed off with soap and water when the angler or hunter leaves the woods. Although I have not tried these last two receipts I understand that they are both good.

"DAVY CROCKETT."

[We have tried all these thoroughly. They are the best known remedies, and are all efficacious to a degree, but we prefer and have always unqualifiedly recommended the tar and oil. It is not nasty or unpleasant to use, and acts as an emollient as well as preventive.—Ed.]

—Charles Lanman, Esq., of Washington, D. C., the veteran author and angler, can often be seen on the Potomac River, exercising his bass rod.

—Black bass continue to abound in the Potomac, and were never so plentiful. They run from 1½ to 2½ pounds.

Our readers are indebted to our well known correspondent, Thad Norris, Esq., for "what he knows about black bass fishing in rivers of the Middle States. His letter appended will be serviceable and appreciated, we hope:—

208 WEST LOGAN SQUARE,
PHILADELPHIA, Penn., June 1, 1874.

EDITOR FOREST AND STREAM:—

In response to your inquiry as to the best place for black bass on the Delaware and other Pennsylvania streams, I would state that these fish have been so recently introduced that they have not had time to multiply sufficiently for good fishing. The Delaware was stocked with 550 brood fish in the fall of 1870. These and their progeny to the third generation are busily following out the law of their nature in replenishing the water, and there is every evidence of rapid increase in number. The limit of time for prohibition to taking them expired July 1, 1873, and last fall there were moderate strings caught in the neighborhood of Easton. But they were mostly small fish of a year old, averaging, according to our commissioner, Mr. Reeder's estimate, half a pound, and those of two years old a pound. In some rare instances the old settlers weighing from three to six pounds were taken. The Susquehanna, with half the number of brood fish brought from the Potomac, afforded more sport. I heard of frequent catches of from one to two dozen, averaging from one to one and a half pounds, by Harrisburg anglers. We have them in the Brandywine, where the term of prohibition has also expired. The game laws of the State, which extend protection to fishes, make it illegal to take them between January 1st and June 15th, thus ensuring them against molestation during the spawning season, which extends from about the middle of May to the first week in June.

If any one contemplates a serious raid against the so-called black bass he should by all means go to the Potomac or some of its tributaries. There is good fishing at various points, from the Great Falls to Harper's Ferry and Williamsport. Sandy Hook, about four miles below Harper's Ferry, is said to be an excellent stopping place, with fair accommodation. I am told by an old angler who has had great success there, that Dam No. 6, two miles above the station called Sir John's Run, and about 120 miles from Baltimore, is the best place for large bass on the river. The Capon comes in here on the Virginia side, and is reported to be well stocked. There is no public house at this place, and the angler would have to seek entertainment of some private family on the river. On the Shenandoah there is good fishing. One place of note is Riverton, where the angler will find good accommodations at extremely moderate charges with Major J. R. Richards, who for a long time refused to take pay at all, until his friends and visitors forced him to establish a moderate rate per diem. His post-office is Riverton, Warren county, Va. I give this information as coming from those who have visited the points named, and am not able to post your readers further.

THADDEUS NORRIS.

BASS FISHING IN LAKE ERIE.

MIDWAY, Woodford county, June 3, 1874.

EDITOR FOREST AND STREAM:—

I send you a few lines in reference to our spring trip to Point au Pelee Island on a fishing trip. A party of seven left here on 18th May, and arrived at destination on the evening of 19th. We had some windy weather, which necessitated our going to different parts of the island on different days to fish. Remained eight days, having some fishing each day (except Sunday), taking about 2,000 pounds of bass weighing from 2½ to 4 pounds. The fish were heavy with roe, and in cleaning them we found they were all females; don't remember having a single male. Is not this rather unusual? Caught some pike of 12 pounds, cats of 15 pounds, and a few pickerel. We use in our fishing the Meeks reel made at Frankfort, in this State, which we think the only good reel, and prefer the Japanese cane to bamboo or other poles, thinking the bamboo too elastic for these fish. I send you a piece of line I fish with, and with which I landed a 12-pound muscalouge. [A very delicate and fine braided linen line]. The fall fishing is best about the middle of September, and fish are generally about one pound heavier than in spring. The South Side Dock is, I think, the best place to go to; better accommodations, but you have to fish in boats. The best point to obtain men is at Put-in-Bay. I understand that the best ducking is in October, as the wild rice is then ripe. West Dock is the best part for ducking and fishing combined, as you are near the marsh. For information address Robert McCormick, Kingsville, Ontario, Canada, the nearest post office for South Side; Walter Grubb, or Dr. McCormick, Kelley's Island, Ohio. The fishing was better than usual at all the islands this spring. J. SUTTON.

SHAD FISHING IN THE CONNECTICUT.

SPRINGFIELD, June 11, 1874.

EDITOR FOREST AND STREAM:—

I went up to Holyoke last evening to try my luck with the shad. It was a favorable evening. There was a light breeze down the river, the water was falling and running clearer. The gentle and courteous Thos. Chalmers met me with the report that the fish had been biting all day. It was between five and six o'clock when we got our boats into a good position in the rapid water below the bridge from which we could see a good many lines trailing for shad. In a few minutes I took a handsome fish weighing five pounds. Next I took a pair, one weighing about four pounds, the other two and a half, and in less than an hour I had hooked seven fish, four of which I saved, two being hooked in a soft mouth and one was lost by fouling with a comrade's line. This is the short and simple account of one evening's shad fishing. About sunset, which is considered the most favorable hour for these fish to bite, they unaccountably stopped biting last evening and no one took a fish after that time. Now, I shall be sorry to disenchant anyone, or "bust" the day dream of the pensive angler, but catching shad at Holyoke is not fly-fishing *par excellence*. Guided by my previous experience last year and this, and profiting by the better success of the angling genii of the place, I discarded all my light tackle, my beloved ten-ounce Norris, and my esteemed ten-dollar Orvis, and took an elastic but anonymous trolling rod, to which I attached a salmon reel with 150 yards of line. The boat anchored in a favorable spot, about 100 yards of line is let out down the rapid water, and this is the way shad are taken with a fly at Holyoke. But if this style of hooking the shad is a little *roocco*, I must say that when well hooked he gives good sport. He fights hard and dies, as it were, under protest.

The Chalmers brothers, Thomas and John, keen anglers both, are most kind and courteous to fellow anglers who come from a distance to try the sport they have discovered at their doors. Every day they are called upon to fit out some errant fisherman with tackle, boat and guide, all of which they do without money and without price. They ought to receive an angler's testimonial, a monument of monolithic fish-hooks, with an undying line upon it. But as Thomas has a rising young brood of eight children, he would doubtless prefer bread in some form, to stone or brass—or even fishing rods.

Perhaps I ought to tell for the benefit of my friend Norris, and those other fish culture fellows, that I caught a shad about eight inches long and two and one-half broad, which brother Chalmers said was a yearling, and another fourteen inches long and four broad, said to be two years old. And yet we were told that the infant shad was so precocious that when he first left the Connecticut he staid away three years!

Yours,

B. F. BOWLES

—The Montreal *Gazette* announces the annual visitation of immense swarms of the shad-flies (mentioned by us on several occasions,) which are believed to prognosticate an abundant supply of shad in the river.

NORWICH, CONN., June 14, 1874.

EDITOR FOREST AND STREAM:—

Herewith I give you the result of my fishing with a fly, in the Shetucket river, at Greenville Dam, one mile from this city. The first day, having about 100 feet line out, I felt a strike quite heavy, and supposed that it was from a shad; (at the time I was using a very light "fly rod") and you can judge my surprise when, upon landing my fish, I found I had what we call here a "Bony fish." At the next east I took two more; at the next I struck a large shad, held him about fifteen minutes, and lost him; the next was a large daee, 1½ lbs., then a bony fish. The above was the result of two hours fishing. These are the first bony fish I have ever known being caught with a fly. They showed as much game and played as lively and fought as hard as a trout of the same weight. I caught them upon the white fly sent me by Mr. Chalmers, of Holyoke, Mass., and one on a brown and white fly that I procured at Bradford & Anthony's, Boston. The next evening I went up to the dam, hooked on to three shad, and saved but one, which weighed a little over 4 lbs. Last evening I was up again and got but two strikes from shad; lost one by fouling with another line that was out, and one tore out and got away. However, I am satisfied that the Shetucket river at this point will afford as much sport as one can ask for when the water gets down to its ordinary stage at this season of the year, as we have had more or less freshet all of the spring and summer. I was thirty-five minutes killing the shad, he was out of the water frequently and fought hard.

E. P. SLOCUM.

CANADIAN TROUT STREAMS.

PEACEDALE, R. I., May 18, 1874.

EDITOR FOREST AND STREAM:—

The stranger in Montreal and even the denizen of that calcareous city is frequently mildly surprised at having the name "Kilkenny" uttered with an accent of much familiarity, and with such accompaniment as to lead him to wonder what interest that particular locality has for so many persons. The name is probably associated in his mind with those two cats of pugnacious memory; but to those "who have been there" the term has quite a different significance. The tourist who climbs the tower of the French Cathedral will see from its summit a long range of low mountains bounding the western horizon. Should he be fired with a desire to make their closer acquaintance, he will find upon approach that they are merely hills, and that they consist of a series of parallel ranges more or less broken in their character, doubtless, but still retaining sufficient distinctness as to be designated as the first range, second range, &c. Between the ninth and tenth range lies a body of water named "Kilkenny Lake," more familiarly known as "Kilkenny." It is some two or three miles long and about a mile in breadth at the widest part. The water is comparatively clear, but the great depth, combined with the dark bottom and the shadows of the surrounding hills, detracts much from its apparent purity. In Red Trout Lake, two and a half miles distant, the scene is different. The overhanging cliffs are absent, the water is shallower, and so transparent that objects are visible at a depth of over twenty feet. The scenery around these lakes is wild and broken but hardly grand. The woods teem with ruffed grouse and neither bears nor deer are very scarce. The roads are extremely hilly and rough in the vicinity of the lake, and vehicles are subject to much violent bumping. The lake so walled in by hills, and consequently not so breezy as might be, but the altitude has a perceptible effect on the temperature. Now a word as to the fishing. The principal fish found in Kilkenny Lake are the trout, lake trout and bass. There are also taken in small quantity in the winter, white herring. This latter fish is said to be exceedingly delicate and fine in flavor, and from all I can learn seems to be the whitefish of the great lakes. How it came into Kilkenny is a mystery, as it is found in no other lake in the vicinity. It is an unfortunate circumstance that the trout in this lake can only be taken freely at two seasons of the year, viz: during the latter half of May and first half of June, and the latter half of September and first half of October; but from the first of October it is unlawful to fish. During the summer an occasional "lunge" may be taken bottom fishing, but the angler had much better devote himself to the black bass, which are very numerous. There are two kinds of trout in this lake, the lake trout or "black trout," as it is called, growing sometimes to twenty pounds weight and much more slender and graceful than its Lake Superior brother, and the "red trout," or brook trout (*Salmo fontinalis*), which seldom weighs over four pounds. In the seasons spoken of the latter fish will take almost any bait, and I have even caught them with a spoon, trolling. Among flies their favorite seems to be those with yellowish bodies and mottled wings, and I have one before me now which proved, in the latter part of the season particularly, killing. The size is that of a small salmon fly; body yellow, wound with flat tinseel; tail rather long and of a light mottled black and white; wings mottled brown and black, with inner wings of pale red; hackle a yellowish gray. Round the head are two or three turns of peacock herl, which give an appearance of a head and eyes. I have seen again and again two fish rush for a similar fly at once, leaving the other two flies untouched. The fishing is mostly from boat or raft, the only place from whence a fly can be successfully thrown, being at the inlet of the lake. When fishing with bait or minnow, however, many rocks near shore afford a good foothold. In Red Trout Lake, two and a half miles from Kilkenny, there are no fish except the brook trout, and any one going there at the proper season—well, I don't want to tell the story of a certain day's fishing there, for fear of its being accounted entirely too fishy. The trout in this lake are not always to be depended on, as one day they will bite freely and the next, though a precisely similar day in all respects, you will not get a rise; but in flavor and gaminess they are superior to the trout of Kilkenny Lake.

Of Lake Masson, several miles from Lake Kilkenny, almost fabulous stories are told, but I have, unfortunately, never been able to test the truth of them; and there are several small lakes close by Kilkenny which, though difficult of access, afford splendid sport.

The visitor to these lakes will require to camp out, or else run the chances of accommodation at some log cabin; in either case they will require to bring all supplies from Montreal. Access is by stage once a day from Montreal to New Glasgow; fare, \$1. At New Glasgow a team must be hired to the lake, about nine miles. At the lake, William Hamilton, called "Rapidee Willie," to distinguish him from a second William Hamilton, will find a boat, or render any other service that he possibly can. The Ward brothers also live near the lake and are very obliging. Mr. John Haille, who lives between New Glasgow and the lake, is a thorough sportsman; his hand is always extended to any brother of the rod or gun, and any information or assistance in his power he will cheerfully give. There are many ever ready to extend an open and hearty welcome to the true sportsman wherever he goes, and the neighborhood of Kilkenny Lake will prove no exception.

MANTLET.

—Fishing in certain parts of New Brunswick is not without its perils, as the following letter will show:—

ST. JOHN, N. B., May 23, 1874.

EDITOR FOREST AND STREAM:—

As some of the readers of your popular sporting journal may think of cruising in this province during the summer, the following may prove both interesting and cautionary:—

I recently made a fishing trip to Lake Utopia, and camped out hermit fashion. During my cruising I saw bear tracks fresh and plenty, but considering myself lord over fish, fowl and brute, thought brain would

be satisfied to keep away from me. I, however, kept a good fire going at night. On the third day I went to a little lake about two miles from camp and did not return till the day following. On my return, to my horror, I found my commissariat in a sad state of confusion, grub gone, dishes flung about, blankets torn, a fine lot of trout "I had buried in the moss," dug up and disposed of, and last, but not least, my only bottle I found about twenty yards off, cork out and dry! whether sucked or spilled, I did not know or care. I soon saw convincing proofs that a bear had been there. I having nothing to eat, excepting the trout I had that day caught, and not caring to Robinson Crusoe it any longer, took a new departure forthwith, and determined to go it alone no more in that quarter.

Yours, &c., R. BEAUCHAMP.

BLUEFISHING AT BARNEGAT.

BEVERLY, N. J., June 6, 1874.

EDITOR FOREST AND STREAM:—

Having a chronic attack of bluefish on the brain, and an acute one of *cacoethes scribendi*, I have resolved upon clothing my ideas in the drapery of ink and discuss bluefishing.

The run of large fish failed to put in an appearance at the usual time, and as I expected them to arrive during full moon tides, last Monday afternoon found me at Barnegat. A few small fish had entered the bay, and we indulged in handling them in. Tuesday, catch numbered 68; Wednesday, 71; Thursday, 122; Friday, 75. Fish averaging about 2½ pounds. On Thursday the condition of the bar admitted of our crossing it, and we took a cruise outside but failed to find large fish. The impression among the fishermen is that they have given the bay the cold shoulder for the first time. The small (or summer fish) ranging from one to four pounds will be plentiful in the bay until the first week in September. The best time to capture the small run, according to my experience, is from the middle of July until the middle of August. During my recent visit I met several readers of the FOREST AND STREAM, and Capt. Ridgeway informed me that he had received several letters from piscators who have seen his name mentioned in F. and S.

It has been asserted that patience is a virtue, and on Thursday and Friday last I had a practical illustration of it. On Thursday I noticed an old sheephead on the sheephead ground for eight hours, and on Friday we had a repetition of the dose. We approached and inquired "What luck?" The reply was: "I had two bites yesterday, and expect to catch a sheephead soon." Referring to sheephead, I cannot refrain from pointing out how jealously the Barnegat fishermen protect those noble fish from seine fishermen. Last summer some Jones River fishermen made several hauls on the sheephead ground and captured quite a number. They returned the next day and made another attempt. The net fouled, and after a time they managed to secure their seine in a dilapidated condition, and landed three barrels of cement and two old stoves. Sixteen barrels of cement and sundry old stoves remain to reward the efforts of future adventurers.

Some of your readers will ridicule me for being so enthusiastic over bluefishing; but, Mr. Editor, the many are fond of fishing, and it is but the few who can handle the fly rod. The majority cannot afford to expend \$30 for a fly rod, or to incur the expenditure of the necessary funds for a trip to Canada or the Adirondacks. The majority can devote two or three days to visit a locality where excellent sport can be obtained on reasonable terms, and it is for the novice and occasional fisherman that I write. On Wednesday last I met an old acquaintance at Barnegat in company with his cousin. The latter spent the three last summers in Canada trout and salmon fishing. They informed me that they had perused my article in your columns, and had arrived at the conclusion that it was not a fish story, and resolved upon trying their luck. They expressed themselves as being more than pleased with their limited experience at Barnegat.

AL. FRESCO.

Friday 12th June.—The inlet and lower bay is literally alive with a run of large fish. Yesterday very large fish were running opposite Egg Harbor Inlet. Many were caught ranging from 15 to 22 lbs. The number of squids and lines that went to "David Jones' Locker" cannot be estimated. To-day I personally landed two hundred and sixty-three; weight, twelve hundred pounds.

A. F.

CISCO FISHING IN WISCONSIN.

ELKHORN, Wis., May 28, 1874.

EDITOR FOREST AND STREAM:—

Possibly some of your readers may be interested in a brief mention of sport which, so far as the West is concerned, we claim is peculiar to this vicinity, to-wit:—Cisco fishing at Geneva Lake. I know it is claimed by writers who evidently jump at their conclusions, that the cisco is found in vast numbers in Lakes Erie and Michigan, and that it is taken, in fact, from various western waters inland. I don't know how it may be with Lake Erie, but presume the fish taken there are identical with the herring taken from Lake Michigan, which do resemble the cisco in many particulars, but are at once seen to be "a horse of another color," when compared closely. Cisco fishing at Geneva Lake has been an "institution" for several years, and to the best of our knowledge the cisco has never, until this spring, been taken from any other water in the west. A few years since, when this question was up, Mr. Roosevelt of New York informed me that he thought the same fish was found in Lake Ontario, but that he had not seen or heard of them elsewhere. From the fact that what we call the cisco fly (probably the May fly) was found at Troy Lakes (Walworth county, Wis.), it was believed that the cisco might be taken there also; but all attempt to solve the question had failed until this spring, when accident betrayed the presence of these fishes in those waters. We now think that they may be found in other lakes and streams whose waters run into Fox River, as do the outlets of both Geneva Lake and Troy Lake. But at this writing there is no well authenticated account of a cisco ever being taken with the fly in this country, save at Geneva Lake; and hence all interest in this unique sport centers upon that dear, delightful pond.

The cisco season is usually about the 10th of June, the run lasting about a week. I remember two or three years when they came earlier—once as early as the 1st of June, but persons coming from abroad to enjoy the sport would hit the mark nine times in ten by being on the ground June 10th. Invertebrate fishermen find fair sport now-a-days in trolling for pickerel and black bass. Indeed, I saw this forenoon a string of fourteen pickerel, averaging 2½ or 3 pounds weight, that were taken from Delaware Lake, four miles from this place, in three hours' trolling this morning; but our black bass fishing does not commence in earnest until about the middle of June, and anglers of every degree are now thinking about and preparing for cisco time. The cisco has been so often described, that its appearance and peculiarities are doubtless familiar to your readers, and must not be dwelt upon here. It is a very symmetrical fish, and they are remarkably uniform in size, weighing from six to ten ounces, the majority of them perhaps seven and eight ounces. Very light tackle is required, and although it is said that they will bite ravenously at anything, my experience has been that, as a rule, they can only be taken with the fly, myriads of which are found on the grass and bushes along the shore during the cisco run. There are differing opinions in regard to the quality of ciscoes for the table, many holding that they are unsurpassed by any fish that swims, and others placing them far below the brook trout, black bass, and bullhead even. They are very white and delicate, and the fact is that when properly cooked, immediately after being taken from the water, they are very fine. The Greenhead Club have for several years past spent a week in camp at Geneva Lake in cisco time, and we have had much rare sport in taking the little beauties and many a square meal of ciscoes on the ground.

Geneva village, a delightful and growing place of summer resort, is situated at the foot of Geneva Lake, and is headquarters for the cisco campaign. But during the "run" thousands of people from the surrounding country visit the shores, hundreds of people tent on the beach, and scores of camp fires are seen on all sides in the calm summer nights. It is worth the while for any enthusiastic piscator to go a-ciscoeing once

in his life at least. He will very likely conclude that it is not equal to salmon or trout fishing, but he will find his skill and patience sufficiently taxed to make his first dozen ciscoes seem a genuine and thrilling victory.

Geneva is about sixty miles northwest from Chicago, and easily reached by rail via C. and N. W. R. R. Good hotel accommodation and all sorts of boating facilities may be had at reasonable rates.

At this writing it is not determined whether or not the Greenhead Club will pitch their tent on Geneva Lake this season, but should any of the FOREST AND STREAM staff conclude to cast a fly for ciscoes thereaway this season, let him or them fail not to find and enter the Greenhead camp.

GREENHEAD.

Rational Pastimes.

—A match game of cricket was played on Saturday last at Haverford College between the 2d Eleven of the Dorian C. C. of the College, and the 2d Merion Eleven. Want of time prevented the match being played out, the Merion not finishing their second innings, and the Dorians getting no second innings at all. The "Mary Anns" got the ball on the score of the first innings. The game stood, when it left off, for the Merions, 107, with nine wickets down; for the Dorians 33 in their first innings, their second innings not played.

—We note the following base ball games since our last issue:

June 10—Athletic vs. Mutual at Philadelphia.....	13 to 3
June 11—Boston vs. Philadelphia at Philadelphia.....	9 to 5
June 11—Chicago vs. Baltimore at Baltimore.....	12 to 6
June 12—Baltimore vs. Boston at Baltimore.....	17 to 12
June 12—Mutual vs. Athletic at New York.....	9 to 6
June 13—Chicago vs. Baltimore at Baltimore.....	14 to 11
June 13—Mutual vs. Boston at New York.....	19 to 11
June 13—Red Stockings vs. Atlantic at Brooklyn.....	15 to 4
June 15—Philadelphia vs. Chicago at Philadelphia.....	8 to 6
June 15—Chelsea vs. Flyaways at Brooklyn.....	18 to 6

—In a game of base ball played at New Haven, on Saturday, between the Nightingales of that city and a nine from Gen. Russell's Institute, the ninth inning resulted in a tie. The nines were compelled to play seventeen innings before the game was decided, the score standing 10 to 8.

—A match game of cricket was played at St. Louis on Saturday, June 6, between the second elevens of the St. Louis and St. George clubs, which resulted in a victory for the former club, by a score of 125 to 98, in two innings.

—A cricket match was played on the grounds of the Boston Club at East Cambridge, on Saturday, between the Albion Club of that city and the Harvards of Old Cambridge, in which the Harvards won in two innings by a score of 80 to 79.

—James Gordon Bennett has contributed two thousand dollars to be expended in prizes for walking and running matches in Saratoga July 17.

PRINCETON, N. J., June 13, 1874.

EDITOR FOREST AND STREAM:—

Since my last communication the Princeton College Nine have played several games, the first of which was with the Hartford Club on the 4th inst. The "boys" could not get down to play until the 5th inning, when the Hartford's had already secured 9 runs to their 1. Still by plucky up hill play and fine batting the game closed with the score, Hartford, 14; Princeton, 6. On Saturday, June 6th, the college boys took a little trip to Germantown, and there engaged the celebrated Germantown Base Ball Club, on whose nine we noticed the famous cricketers Bob and Dan Newhall. The fielding of the college boys was simply superb, they never being in better trim, but three errors being accredited to them, while their opponents showed lack of practice, although they batted heavily. The score was as follows:

Germantown,..... 1 | Princeton,..... 8

For the past week the Princeton nine have been very busy with examinations, and base ball has been at a discount, but on Saturday, June 13th, the Nameless Club of Brooklyn, which has been playing many college nines this year, took the opportunity of visiting Princeton. Though the wind was blowing quite strongly in the morning it did not interfere much with the game, which came off at 12 M. The fielding of the Nameless was loose, and not up to their mark, the left fielder short stop doing good work for them, and Grierson handling the ash in good style. The playing of Princeton in the field was excellent with the exception of Beach, who by errors gave them the 4 runs, Mann, Woods and Van Deventer, bearing off the palm, while their batting was very heavy. Williamson, 5 base hits, leading, followed by Beach 4, and Jacobus 3.

The game resulted in an easy victory for the college boys by the following score: Nameless, 4; Princeton, 21; Umpire, Mr. A. C. Crawford, Princeton, 74; Base hits, Princeton, 22; Nameless, 8.

On the 23d of the month some professional or college club, if we can persuade the latter, will play here.

The Caledonian games have been set down for Saturday, June 20th, at 1 o'clock in the afternoon. The entries are numerous, and owing to the active interest taken in these games and the earnest training, a fine contest may be anticipated.

Though this is but the second year of the establishment of this organization, yet in our games last year many of the performances were highly commendable and flattering. The order of their performances will be: Throwing Base Ball, Standing Long Jump, 100 Yard Race, Putting Cannon Ball, Standing High Leap, Running Long Jump, Hurdle Race, Throwing the Hammer, Run, Hop, Step and Jump, Vaulting with Pole, ¼ Mile Race, Running High Leap, Hitch and Kick, ½ Mile Race, Three Legged Race.

For each of these ten (a first and second) gold medals will be given. A valuable gold medal will also be presented by a friend of the college to the best general athlete.

J. H. VAN DEVENTER, President.

THEO. SHELTON, Secretary.

CHAMPION.

NEW HAVEN, June 13, 1874.

EDITOR FOREST AND STREAM:—

On June 10 the Yale nine, for the second time this season, met the famous "Atlantic" club, on the grounds of the former, and for a second time this year suffered defeat. Atlantic, 15; Yale, 13. On Friday, June 12, the Yales were beaten by the Hartfords by the following score—Yale, 8; Hartford, 17. A game is announced to have been arranged with the Philadelphia club for June 20 in this city; also, it is contemplated with the Baltimore nine.

"TYRO."

Answers To Correspondents.

J. W. S., Waterford, Conn.—Answer in our next.

C. W. A., Newark.—Will print your letter, with reply, in our next.

R. W. A., New Haven.—Write to Doc Stuart, Bloomingburgh, Sullivan county, N. Y.

D. H., New York.—Are robins really an insectivorous and harmless bird? Ans. Yes.

W. D. V., Jr., Brooklyn.—What is good for the face, when out fishing, to prevent sun tan? Ans. Buttermilk.

BUENA VENTURA, Flint, Mich.—Yours received with thanks. Will print at earliest opportunity.

OLD PIGEON SHOOTER, New York.—You do not give your name. Note italics at the head of this column.

P., Boston.—Can you supply Nos. 1, 11, 17, 19, vol. one, to a subscriber to complete his file for binding? Ans. Yes.

CAMPER.—Most of the wilderness hardwood knobs of Pennsylvania abound in squirrels, and are interspersed with trout streams.

H. R., Duluth.—We have sent a portion of your letter to the gentleman mentioned. He is perfectly reliable and will answer you in a day.

SECRETARY.—The builders of bass wood (not cedar) canoes in Ontario, Canada, are, Wm. English of Peterboro, and — Gordon of North Douro. Shoe packs are not made in Peterboro.

C. W. B., Newark.—Having had a discussion when close season for trout commences in the States of New York, Pennsylvania and New Jersey.

H. E., Pittsburg.—If a fine black and tan bitch has her first litter to a board yard, or common cur, does it follow that all her succeeding litters will be impure, although she is bred only to pure dogs? Ans. They will.

MASTER LEWIS, Alleghany City.—Original copy of Walton excessively difficult to procure and worth its weight about thrice in gold. See article in FOREST AND STREAM of January 22, 1874.

L. M. H., St. Paul.—Think the rifle you ask about is the very best for the purposes you require. It is light, convenient, wonderfully accurate, and we believe, as a magazine gun, superior to all others.

H. CARSON, Akron, Ohio.—Do you know whether there are any deer and bear in the mountains of southern Virginia? Ans. There are deer and bear all through the mountain ranges of southwestern Virginia.

QUEBEC.—Will United States money pass current in Canada, vicinity of Quebec, or will it be necessary to take English money? Ans. In Quebec, yes; in the vicinity, no. You can exchange greenbacks for silver in Quebec at any place.

B. B., Schenectady.—What is the best map of the Adirondacks? Ans. Ely's, published by Colton's, New York, and for sale at Syracuse book-sellers. We know nothing of the contemplated new map by a Brooklyn photographer. Who is it?

G. R. WINTERFIELD, New York.—Where can I find good snipe shooting during the months of July and August, particularly the latter month, and not have it attended with very much expense? Ans. Tom's River, Barnegat; Quoogue, Long Island. Go to Captain Cooper's.

W. W., New York.—Where can a party of boys camp out about fifty miles from New York, and would July or August be a good month to go there, and how much is the fare? Ans. On Lake Oscawanna, Putnam county; about \$3 each. The best months for general fishing.

PISCATOR.—Can you tell me where I can find good fishing in the neighborhood of N. Y. City, salt water preferred? Ans. Hurl Gate, Jersey Flats, Kill von Kull, the Narrows, Coney Island Creek, Canarsie Bay, Rockaway Beach, Barnegat, Shrewsbury River, Fishing Banks, &c., all within an hour or so of New York.

W. H., Rakston, Pa.—It is lawful to catch trout at any season of the year in the public streams of Pennsylvania for the purpose of stocking ponds; but they should be caught in a way not to injure the fish not used. The State Commissioners are H. J. Reeder, Easton; B. L. Hewitt, Holidaysburg; James Duffly, Marietta.

PISTOL, Philadelphia.—The best pistol for target practice is Stephenson's; one with a skeleton stock which can be put on or off at pleasure; size of cartridge, 22; 10 to 12 inch barrel. The range should be at 12 paces—26 feet—to start with, to be increased up to 60 feet. Size of target with an inch bulls-eye, about six inches in diameter. Send to Mr. Conlin, No. 930 Broadway, for targets.

E. B. J., Long Branch.—1. Would a cross between a setter dog and a pointer have hair between his toes, and what do you think of the cross? Ans. See FOREST AND STREAM May 21. 2d. If a fine pointer bitch had pups by a coach dog, would they be worth anything as sporting dogs; would they not show their father plainly? Ans. They would be utterly worthless. 3d. Are not pointers often spotted? Ans. Yes.

R. L. W., Alleghany co., Penn.—Think at all ranges there is no difference between the arms. The question though is not, as yet, fully decided. In England for long ranges muzzle loaders are preferred, but in this country our breech-loaders, we think, are better than theirs. A true Dandy Dimont would be difficult to procure. Write us later—in about six weeks—and we may perhaps find you one.

A. BELLAIRE, Ohio.—I notice that parties intending to fish the Neepon waters are instructed to take rod and tackle of greater strength than that used in other quarters. Please give me your idea of the weight and other requisites of a rod, &c., to be handled by one whose experience with snails is rather limited? Ans. Take a light salmon rod. Our own is a split bamboo, length, 16½ feet; weight, 2½ lbs. The rapids are strong, the river wide and very deep, and the fish not to be trifled with; average weight fully three pounds.

A. B. F., Greenville, Me.—Small trout fry—say yearlings—1,000 of them, were carried by Mr. Stone in eighty gallons of water, kept very cold and well aerated, a distance of 109 miles about this time of the year. We should think that in 100 gallons of water sixty half-pound trout could be safely carried. Temperature of the water should be kept somewhere in the neighborhood of 65 degrees with ice. Aeration can be produced by taking the water up with a dipper and letting it fall at a distance of a couple of feet in a thin stream, or by using a colander for the same purpose. Consult "Domesticated Trout," by Livingston Stone.

SUFFERER.—A correspondent kindly sends the following remedy for ivy poison: Tincture lobelia, (equal parts water) or sugar of lead, or Pond's extract (Hammali's). I have tried all of the above, and find them good for ivy poison. Think the "Hammali's" the best; very cooling and allays the itching, &c. Ivy poison has a "run" of about one week, no matter what you apply. I was badly poisoned three times last season, and used the lobelia and Hammali's.

Another correspondent recommends carbolic acid and glycerine in the proportion of about one part of the acid to three of glycerine, which is also good for all kinds of insect bites, burns, cuts, bruises, &c.

And still another correspondent, who is an old woodsman and veteran of the Mexican war, recommends a strong decoction of lobelia applied outwardly.

W. M. O.—Will you inform me in your Answers to Correspondents where I can buy a rawhide lasso, also about what it would cost? Ans. Go to the "Swamp" and buy a green bull hide, lay it flat on a smooth floor, cut off the legs and irregular pieces with a sharp knife until you bring it to an oblong or oval shape, then commence at the outer edge and cut a strip an inch wide or more, following the circular form until you have secured the required length, which should be fifty feet; then wind it on two posts, trees, or stakes, drawing it as taut as possible so as to stretch it. Then roll it foot by foot between two small boards to make it pliable, and then boil it in oil to keep it so, otherwise it will become very hard and dry when it gets wet. Then make a slip-noose at the end, and your lariat is complete. To ensure a good, free running noose, bend the end on over an eye or iron ring three fourths of an inch in diameter. A lariat made of strips of buckskin braided and oiled is very serviceable.

are the two lowest mean deviations on record at a range of 500 yards. We publish these targets to let our people know that the government of the United States is indefatigable in perfecting its arms, and is arriving at wonderful results. It is not alone in the war department that experiments as to the materials, such as iron or steel used in arms are being made. In the navy, Commander Beardslee is likely, by his discoveries, to revolutionize the old theories in regard to the strength of iron, and, with Professor Thurston, of the Stevens Institute, they have both, curiously enough, arrived at this important fact—that iron, when under tension or strain, and left to itself, absolutely increases its power of resistance. What improvements, then, in arms, materials, and in the explosive compounds may not be expected in the next ten years!

CREEDMOOR—SHOOTING FOR THE REMINGTON DIAMOND BADGE.

OWING to the rain during the opening match, as may be found by referring to our issue of June 11th, the match for the Remington Diamond Badge was forcedly postponed. This important event took place on Saturday last, June 13. Experts from home and abroad look with no little interest for this match, as by the scores some kind of prognostication can be made of our ability to hold our own with the Irish team. As the terms of a final possession of the very handsome badge offered by the Messrs. Remington require that it shall be won three times by the same person, and the event of Saturday placing it in new hands, we may expect that this reward for good marksmanship at long ranges will most thoroughly test the shooting and staying powers of the Amateur Rifle Club.

The weather was fair, a little uncertain at times, clouds occasionally producing varying effects of light, and the wind blowing from time to time in puffs, from V to IX, that is, from the back to the left of the range. There are certain currents of wind on the range most peculiar in their action, which are only observable by the careful marksman, who watches Boreas, when at long range, as would a China captain when on the *qui vive* for a typhoon. On Saturday last, at the 1,000 yard range, at one and the same time, the wind showed by the flag that it was blowing from the south and from the west in two distinct currents. We would particularly suggest to General Shaler that more flag staffs be planted—say one at the 500 yard range, and another at the 1,000 yard range. They might facilitate the shooters.

There was an excellent gathering of the *élite* to contest for Match No. 5 of the spring meeting of the National Rifle Association. The regulations under which the Remington Diamond Badge were to be shot for were as follows:—The distances were 500, 800, and 1,000 yards, any position; seven rounds to be fired at each range, with the privilege of two sighting shots. The twenty best scores at 500 yards to compete at 800, and the ten best to compete at 1,000. There were thirty-two entries at the 500 yard range. The following are the scores:—

Name.	Arm.	Score.	Total.
Lieut. H. Fulton	Sharp mil.	4 4 4 3 1 4 4	27
L. Backer	Rem sport.	4 3 4 4 3 4 4	26
J. S. Conlin	Sharp sport.	3 4 4 4 4 3 4	26
Col. John Bodine	Rem sport.	3 4 3 4 4 4 3	25
General Dakin	Rem sport.	4 2 4 3 4 4 4	25
A. J. Roux	Rem sport.	3 3 4 3 4 3 4	24
R. Omand	Rem sport.	4 4 4 4 2 2 4	24
George Crouch	Sharp sport.	0 4 4 4 4 4 3	23
G. W. Yale	Sharp sport.	2 4 4 3 3 3 3	22
E. H. Sanford	Sharp sport.	3 2 4 4 2 4 3	22
J. L. Price	Sharp sport.	3 2 4 3 3 4 3	22
A. Alford	Rem sport.	3 3 3 3 3 3 3	21

P. G. Sanford	Rem mil.	0 0 0 0 0 0 0	0

In a possible score of 28, the scores making 21, or an average of a centre for each, are excellent ones. The shooting of Messrs. Fulton, 27; Conlin, 26; Backer, 26; Bodine, 25; Dakin, 25; Roux, 24; Omand, 24; Crouch, 23; Yale, 22; and others, was exceptionally good. The increased range of 300 yards was quickly reached, markers sought the new targets, and the match at the longer distance was soon commenced. The process of elimination being now in order, twenty marksmen were in place, when the following scores were made:—

Name.	Arm.	800 yds.	Total
R. Omand	Rem sport.	4 4 4 2 4 4 4	26
H. Fulton	Sharp military	3 3 4 3 4 4 4	25
J. S. Conlin	Sharp sport.	3 4 3 3 4 3 4	24
John Bodine	Rem sport.	4 3 3 3 4 4 3	24
A. J. Roux	Rem sport.	4 3 2 4 3 4 3	23
J. L. Price	Sharp sport.	4 0 4 3 4 3 3	21
Gen. Dakin	Rem sport.	2 4 0 4 3 4 3	20
J. T. B. Collins	Sharp sport.	4 4 0 2 3 4 3	20
G. W. Yale	Sharp sport.	2 2 3 3 2 3 4	19
George Crouch	Sharp sport.	0 3 3 3 3 3 3	18
E. H. Sanford	Rem military	2 4 3 3 2 2 2	18
A. V. Canfield, Jr.	Rem military	2 4 4 2 3 3 0	18
E. H. Madison	Rem sport.	3 3 3 3 0 3 3	17
Lieut. Col. Gildersleeve	Rem sport.	0 3 3 3 0 3 4	16
W. S. Smith	Rem sport.	0 4 3 0 3 3 3	16
W. F. Edmundston	Sharp sport.	0 0 2 3 4 3 3	15
W. F. Thurston	Rem sport.	2 0 2 3 3 3 0	15
A. Alford	Rem sport.	2 4 3 0 0 4 0	13
Leon Backer	Rem sport.	0 0 3 3 0 2 4	12

Here the difference of the 300 yards commenced to tell. So far, Mr. Omand's 26, all bullseyes save the fourth shot, which was an outer, was a famous one; so was Mr. Ful-

ton's, with 25, Mr. Conlin's, with 24, and in fact all down the line, as far as those scoring 20. It looked as if it was narrowing itself down to a contest between the three leaders of the string—Fulton, Omand, and Conlin—whose aggregate scores were, for Fulton, the handsome one of 53, in a possible 56 (immensely tall shooting), and 50 for each of the other two. Captain Bodine's chances, though he was known to be a steady, quiet shot, were thought to be nowhere. The flags were pulled up, and the exciting match at 1,000 yards was next in order. There having been some irregularity in the printing of the programme, it was agreed, all contestants cheerfully assenting, that Mr. Crouch should shoot with the ten best aggregate scores, which made the number of marksmen at the last stage eleven. Firing was quickly commenced, with the following result:—

Name.	Arm.	1000 yds.	Total
General Dakin	Rem sport.	2 4 3 2 2 4 3	20
Colonel Bodine	Rem sport.	2 4 3 0 4 3 4	20
A. J. Roux	Rem sport.	0 4 4 3 4 0 2	17
E. H. Sanford	Sharp sport.	4 3 3 4 2 0 0	16
J. L. Price	Sharp sport.	0 3 3 0 3 2 0	12
J. T. B. Collins	Sharp sport.	0 3 4 0 0 2 0	9
G. W. Yale	Sharp sport.	0 3 0 3 0 0 0	6
George Crouch	Sharp sport.	2 0 3 0 0 0 0	5
R. Omand	Rem sport.	0 0 2 0 0 0 0	2
H. Fulton	Sharp military	0 0 0 0 0 2 2	2
J. S. Conlin	Sharp sport.	0 0 0 0 0 0 0	0

Evidently there was a considerable slipping up somewhere. Now Captain Bodine was handsomely ahead on the aggregate, with his score of 25, 24, and 20, a total of 69. The wind blowing sharp at the close may have disconcerted such crack shots as Omand, Conlin, and Fulton, but as it was all three of them together scored but 4 in the the twenty one shots. The following recapitulation is necessary:—

Name.	Arm.	500 Yards.	800 Yards.	1,000 Yards.	Grand Total.
Colonel Bodine	Rem sport.	25	24	20	69
General Dakin	Rem sport.	25	20	20	65
A. J. Roux	Rem sport.	24	23	17	64
E. H. Sanford	Sharp sport.	22	18	16	56
J. L. Price	Sharp sport.	22	11	12	55
H. Fulton	Sharp military	27	25	2	54
R. Omand	Rem sport.	24	26	2	52
J. S. Conlin	Sharp sport.	26	21	0	50
J. T. B. Collins	Sharp sport.	20	20	9	49
G. W. Yale	Sharp sport.	22	19	6	47
George Crouch	Sharp sport.	23	18	5	46

Sixty-nine, in a possible 84, is very good shooting. On the 15th of November, 1873, when the last shooting for this match came off, the following scores were made.—J. Omand, 500 y'ds. 23; 800 y'ds. 25; 1,000 y'ds. 22—total, 70. The total of the ten shooting there, was 503. Taking the ten leading shots in the present match the total made on Saturday last was 607, showing a most decided improvement of over ten points per man. We should suppose that this evidence in figures should cheer the hearts of the Amateur Rifle Club, and make them work all the harder in order to tackle with the famous Irish team.

The prizes were awarded as follows:—To Captain Bodine, the Diamond Badge; to General Dakin, the handsome Whitworth rifle, presented by T. C. Clark, Esq., of Philadelphia, and with it a life membership in the National Rifle Association; to Mr. Roux, \$10 in cash; to Mr. E. H. Sanford, \$5; to Mr. J. L. Price, \$5; and to Lieutenant Fulton, \$3.

Mr. Thurston is now on his way to shoot at Wimbledon, and Mr. Omand leaves shortly to take his place with the Canadians among the team going to England. Members of the Seventh Regiment had their quiet match on the same day, and the famous "shells" were won by Mr. E. H. Sanford. To-day (Thursday) the Twenty-second Regiment will have a day of it at Creedmoor. Next Saturday the regular amateur badge will be shot for. Everything seems to be in excellent working trim at Creedmoor, and the enthusiasm for rifle shooting is increasing. We do wish, though, that something serious would be done on the part of the Amateur Rifle Club and the National Rifle Association in regard to the reception of the Irishmen. It is time to commence now.

On Thursday last the Twelfth Regiment met at Creedmoor under the command of Colonel Ward. There were some 200 competitors. The shooting was at 200 and 500 yards. To entitle shooting at the 500 yard range, a score of 8 had to be made. The following are the forty-one best scores:—

NAME.	200 yds.	500 yds.	Total.	NAME.	200 yds.	500 yds.	Total.
Sergt. A. Wood	15	16	31	Lieut. Heizman	10	5	19
Lieut. H. Fulton	15	15	30	Captain Herb	13	6	19
Capt. H. B. Smith	16	13	29	Sergt. Wilson	10	8	18
W. S. Smith	14	15	29	Sergt. Williams	9	9	18
Lt. Col. Gildersleeve	14	13	27	Captain Burns	10	8	18
W. G. Carlson	15	12	27	J. T. Kelly	8	9	17
R. Capron	13	13	26	Private Archer	13	4	17
Capt. V. Krenselaer	16	10	26	Dr. Taylor	8	8	16
Sergt. Reddy	13	12	25	H. A. Hidebrand	8	7	15
James Gault	16	9	25	Private DeBolt	8	7	15
Sergt. Bateman	11	13	24	Private Steadman	11	4	15
Lieut. Rich	15	9	24	J. P. Erbe	12	2	14
Private Dolan	13	10	23	Corp. Robinson	8	6	14
Private Moran	13	10	23	Sergt. Healy	14	0	14
Adjutant Murphy	11	12	23	Lieut. Walker	9	4	13
Private Hope	9	12	21	Private Zersch	9	4	13
Sergt. Cudlipp	11	10	21	Sergt. Hoffmeister	10	3	13
Private Doerle	13	7	20	Private Weston	11	2	13
Private Langely	15	5	20	Sergt. Harte	13	0	13
Private Reigelman	10	9	19	Private Royer	10	2	12
Sergt. Banks	10	9	19				

Already a most decided improvement is seen when the score is compared with that of last year. Taking the total of the first twelve, made on Thursday last, the score amounts to 323, which is in the highest degree commendable. We think it will be a shortly conceded fact that unless the regulars brush up a little, the National Guards of New York city will beat the line badly in shooting.

—Nets are being set every day by the dozen in the Hackensack River from its mouth to Upper Hackensack village. There seems to be no effort to prevent this.

ENCOURAGE THE INTERNATIONAL RIFLE MATCH.

NOW that the International Rifle Match has become a thing accomplished it is important that no exertion should be spared by Americans, whether interested in rifle practice or not, to see that our country is creditably represented upon this occasion. The United States has always been considered the home of the rifleman. At the distances they have been accustomed to shoot, there can be no question but what American riflemen need fear no competition. In the extreme ranges contemplated in this match, however, much more is required than a keen eye and steady hand. The varying influences of the wind, the density of the atmosphere and the optical effects of light and shade on all matters, which, although comparatively unimportant a "forty rods," yet, at a thousand yards, constitute difficulties which can only be overcome by a combination of sound judgment and great experience.

The time during which this experience is to be acquired is all too short, but no effort must be spared to take advantage of it. The gentlemen of the Amateur Rifle Club, who have so pluckily taken up the challenge of our Irish friends, are doing their level best, and their scores at the last long range match, although fired during a particularly perplexing gusty wind, show not only a decided improvement over last fall, but demonstrate also their growing ability to struggle against such contingencies. It is a matter of regret, however, that they do not receive the assistance from the public or the press, which they are entitled to, or which their antagonists are receiving in their own country. In Ireland, and in the leading sporting papers of all Great Britain, the International match is a subject of constant discussion. How are the public behind the press in this matter? Such leading men as Lord Cairns, the Lord Chancellor of England, the Earl of Dunraven, the Earl of Kingston, Viscount Massereene, and others have voluntarily contributed to the expenses of the Irish team, while a large party, among whom are included Viscount and Lady Massereene, have arranged to accompany them upon their trip.

We would respectfully ask what the United States are doing in this matter? What are our powerful dailies and weeklies doing to bring out our skilled shots throughout the land, and to excite public interest in the contest? As far as we know the only assistance that has been received by the Amateur Rifle Club is the \$500 presented by Messrs. Sharp and Remington to make up the stake money required. They have not asked for anything more, but that is no reason why they should not have it. The expenses connected with the match will be heavy. The mere practicing requires no little expenditure of time and money, and the Club will be in no condition without outside assistance to properly represent America upon this occasion. When the English lords and ladies are uniting to assist the representatives of Great Britain, have we not among us some plain democrats who will do as much to sustain the reputation of their country as any representative of the aristocracy? Will not those of our countrymen who have in their different sections renowned riflemen make up a purse to pay their expenses to Creedmoor to help sustain the credit of the country. Think of it! Here are the representatives of Great Britain, the victors at Wimbledon, the winners of the Elcho shield, coming 3,000 miles over here, under the very shadow of the Stars and Stripes, and calmly challenging the whole United States to a contest of skill with our national weapon.

If there ever was an occasion when Americans were expected to do something to maintain their reputation, now is the time. The returns required to be made to the Amateur Club by those intending to compete must be made by July 1st. The contests for positions upon the team will take place during July and the match itself will occur about the last week of September. It behooves us all then to be stirring and that "right smart."

Sporting News from Abroad.

SPORTING PROSPECTS AND RETROSPECTS.

[From our Special Correspondent.]

IT is now the month of May, and the interests of the sporting community who discard the colors of the joekey, and take no pride in the pace of their thoroughbreds, are literally at a discount. Few if any of the English sportsmen have even taken out certificates, though I am sorry to say some men whose occupations keep them in London all the season, except for a few weeks in the autumn, do not take them out at all, and cheat the revenue with the greatest nonchalance.

I remember when I was shooting with a conservative M. P., that a liberal excise officer had the audacity to come suddenly upon us, and demand a display of our certificates. I had mine, fortunately, ready, and so had most of us, or, at all events, we had them safe enough at home, but there were, I was surprised to find, several exceptions to the conscientious rule, and one fat old commodore had to be secreted in the luncheon cart, under a pile of cartridge bags and gun cases, whilst a certain noble lord (I was told, for I did not actually see the transformation scene) got behind a bush and changed clothes with a beater.

There is now but little on in the shooting line, though pigeon matches are at their zenith, and a good deal of money changes hands on the death of the unfortunate doves. Rook shooting, too, is everywhere talked about,

but it has little to commend itself for to my fancy. The wretched, cawing youngsters sit unsuspectingly still on the tops of the elms, and as soon as you can catch a sight of their black plumage amongst the green leaves you blaze away, and a soft and often shapeless heap of down and quills falls thud at your feet, or the young rook struggles into a neighboring nest and lingers out its unhappy existence. The rooks must be killed annually in a certain proportion, or, curious enough, the rookery becomes deserted, and the quaint music of their cry no longer "heralds the approach of day;" but the sport is about fit for the farmers, who generally come in for it, and so are the rook pies. It is a close time for sea birds, and as I write the sea gulls are screaming and chasing one another over Rams-gate Harbor among the very masts of the fishing smacks, as if they knew that the flag of truce had been hauled up. By one recent act of Parliament nearly all birds are safe during breeding time, with the exception of the mischievous ones, such as the sparrow, and if a rare bird does build a nest there is a little hope of its being able to rear its progeny in safety.

As yet week will be a gay one, as it always is, and the toilets of the fashionable ladies who crowd the grand stand are becoming every year more costly, and, to the men who admire a woman's dress are no small feature in the sights of the cup day.

The Crystal Palace dog show looks well; as there is an entry of over 1,200 dogs, it will be the largest show since the glories of Islington, in 1863-65. Several members of the royal family have entered dogs, and as His Royal Highness the Prince of Wales has lately cut the canine world, his return is greatly welcomed by the fanciers. The late prince consort was an excellent sportsman, and his sons all ride well to hounds and shoot straight powder. The foxhound classes are poorly supported. The reason given being the prevalence of hydrophobia and dumb madness, for I believe I am right in saying the two frightful maladies are somewhat dissimilar. The former has met with much discussion lately, but without any practical results being arrived at. There is the famous Berling cure, which the government has been before now besought to purchase, but the "powers that be" will not yet believe in it, though there are, I hear, several instances on record of its efficacy. It is very difficult to determine, in the event of a supposed cure of hydrophobia, whether in the first place the dog really was mad; secondly, whether the patient would have had the disease, and thirdly, if the cure might not be attributable to the use of some other remedy, or rather preventative. Of course there is no lack of nostrums invented by knaves and fools, as for consumption, the bite of the cobra, or any other ill that the flesh is heir to. We are gravely advised to do a thousand extravagant things which are chiefly the theoretical dreams of unprofessional and hence unpracticed amateur doctors, or else merely the dictation of ignorant and superstitious minds. Use the powdered claw of a crab, says one *soi disant* Esculapius, whilst another suggests heaping gunpowder on the raw wound and then lighting it. The fact is, that I don't believe there has ever yet been discovered anything that will absolutely cure hydrophobia, and I believe the so-called cures were not of real attacks of the disease. Patients of the most skilled medical men have been carried off over and over again, and no power on earth could save them. I believe that the disease may be prevented, and I believe that immediate excision, and the use of lunar caustic or nitrate of silver are the best things that can be done. At all events, if I am ever bitten, say, for instance, on the hand, I shall at once fasten a ligature above the place, wash, excise, burn, and trust to Providence. I have a piece of the caustic in the form of a pencil case, and I invariably carry it to a dog show with me. It is, however, a matter of note that men conversant with dogs' manners are very seldom bitten, and I have frequently seen "Idstone," of the English *Field*, when judging at a show, unchain and lead out the most fractious and bad tempered brutes with the utmost indifference, whilst the servants and porters couldn't touch them. In the year 1796 Lord Fitzwilliam's hounds were attacked by madness to a very alarming extent. The disease was spontaneous in the first hound, who communicated it to the rest of the pack by biting many of them. They were all placed in separate kennels, and exercised singly in chains until the ensuing season. The record of this occurrence states, however, distinctly that several of the hounds that were bitten actually recovered, the chief medicine used being mercurial, which in some cases completely salivated them.

There is every prospect of a good grouse season in the north and the moors of Yorkshire and Ireland. Of it, it is difficult now to prophesy, and the owners of moors "to let" are generally rather favorable in their accounts, but still this is the accepted idea. Grouse shooting is becoming every year more and more expensive, and every brace killed often costs about two or three sovereigns to the lessees. The wages of the keepers, the importation of ice and Chablis, Veuve Cliquot, Champagne, Paté de foi gras, big Partagas and Regalias cigars, a Swiss valet, a French chef, and other luxuries, is often insisted on before the shooting box is fit for the sportsman and his setters, and the moor and mountain is made a sort of Capua. Seven hundred pounds, or about \$3,500, was paid for the moor a relative of mine shot over last year, and it was only hired for three months. Deer stalking, which is a royal sport, is still more expensive, and the hirer of a deer forest, which, by the by, is not necessarily covered with trees, and is merely a large tract of heather country, is always limited to a certain number of stags. The Scotch deerhound,

whose duty it is to "retrieve" the wounded stag, is one of the most handsome and sensible of the canine races. He is built for speed and power—fleet as a greyhound, courageous as most bulldogs, and strong as a mastiff. He is trained to go at the ear, and there have been instances of the deer dragging the dog through mountain streams, amongst sharp crags and boulders, and down steep gulleys without shaking off the dog, though the skin of his foe was so torn by the sharp edges of the rocks that the blood marked the trail. "Morni," a dark, stately, guzzle colored hound, the property of Mr. G. W. Hickman, was a magnificent specimen of the deerhound, standing some thirty-one inches high or more. He was so beautifully proportioned that his grand height did not show, and you would have thought him considerably under this measurement. He looked as if he would grace some old hall of a baronial castle, and show off to advantage lying at the feet of the suits of armor beneath the antlers and relics of the chase. The pedigrees of deerhounds do not trace far back, but there is no dog which has been more carefully bred and kept pure from taint. In England he is not of much use, as the only deer besides those in the gentlemen's parks are roe deer, which are very small, in fact, scarcely bigger than a sheep, but in the north he shares the sympathies of his master with the collies and the skyes, and Sir Edwin Landseer well knew and valued his rough symmetrical outline, dignity of demeanor, and picturesque form, when he painted with his own peculiar skill those marvellous sketches of Highland life which have made his name immortal.

LDSTONE, JR.

THE STATE CONVENTION AT OSWEGO.—The sixteenth annual convention of the New York State Association for the Protection of Fish and Game will be held, as announced, at Oswego, New York, under the auspices of the Leatherstocking Club, on Monday, Tuesday, Wednesday, Thursday, and Friday, June 22d, 23d, 24th, 25th and 26th, 1874. This association consists of members of the sportsmen's clubs of the State, and two delegates from each county unrepresented by a club. At business meetings, five delegates from each club, and the county delegates only, are allowed to vote. Members of any organized club in the State, and county delegates, are entitled to contend for the prizes. No trial shots are allowed after the judges have announced time for the contest to commence. Three contestants at least are necessary to perfect any match or contest. The following are the officers of the State Association:—

President, Hon. A. C. Mattoon, Oswego; 1st Vice President, F. B. Klock, Syracuse; 2d Vice President, Henry A. Richmond, Batavia; Recording Secretary, John B. Sage, Buffalo; Corresponding Secretary, Silas M. Allen, Oswego; Treasurer, S. M. Spencer, Rochester; Standing Committee, F. Sidway, Buffalo; James Manning, Syracuse; H. Silsby, Seneca Falls; W. H. Bowman, Rochester; S. Y. Lane, Utica.

The officers of the Leatherstocking club for 1874 are—President, Hudson C. Tanner; Vice President, Morgan L. Marshall; Secretary, J. Forbie Miller; Treasurer, N. W. Nutting.

The programme herewith published has been kindly sent us by Hon. A. C. Mattoon, with the following note:—

OSWEGO, June 12th, 1874.

EDITOR FOREST AND STREAM:—

Please find enclosed the first impression of the correct programme for our shoot. Yours truly, A. C. MATTOON, President.

PROGRAMME—First Day.—The convention will meet at the Board of Trade Rooms, in the Doolittle House, Oswego, N. Y., Monday evening, June 22d, at eight o'clock, when the credentials of the delegates will be received, and the convention organized. All members of clubs in attendance are requested to wear the distinctive badges of their clubs during the convention.

SECOND DAY, Tuesday, June 23d—Pistol Shooting, 9 o'clock A. M.—Ten shots, single barrel, off hand, distance 15 yards, fire at the word. First prize, a Silver-mounted Smith & Wesson No. 3 Revolver, with case; donated by Smith & Wesson, Springfield, Mass. Second prize, two Schaubert Hunting Shirts; donated by S. D. Schaubert, Oswego. Entrance fee, \$5.

Rifle Shooting, short distance, 9½ o'clock A. M.—One hundred yards, ten shots, off hand, open and globe sights, string measure, rifle and ammunition unrestricted; free to the United States and Canada. First prize, Remington Sporting Breech-loading Rifle; donated by E. Remington & Sons, Ilion, N. Y. Second prize, Hunter's Pet Rifle; donated by J. Stevens & Co., of Chicopee Falls, Mass. Entrance fee, \$5.

Rifle Shooting, long distance.—Ten shots, rifles, rest, and ammunition unrestricted; barring telescopes; distance 300 yards. First prize, Silver-plated Ice Pitcher; donated by Wilcox's Silver Plate Manufacturing Co., West Meriden, Conn. Second prize, Opera glass.

State Trap Shoot, 10 o'clock A. M.—Sides to be chosen on the ground; only members of organized clubs and county delegates from this State will be allowed to shoot; ten single birds each, the losing side to pay for the birds; to be governed by the rules of the New York State Association.

THIRD DAY, Wednesday, June 24th—Fly casting, 8½ o'clock A. M.—First prize, an elegant Silver-mounted Split Bamboo Fly rod; donated by J. B. McHarg & Co., Rome, N. Y. Second prize, a highly finished Silver-mounted Fly rod; donated by the inventor, M. L. Marshall, Oswego. Third prize, No. 1 Orvis Fly rod, silver-mounted, with case; donated by Charles F. Orvis, Manchester, Vt. Fourth prize, one of Prof. McCord's Double Spool Rubber Reels, furnished with lines; donated by Andrew Clerk & Co., 48 Maiden Lane, N. Y. Fifth prize, one of Fowler's Rubber Reels; donated by A. H. Fowler, of Batavia. Entrance fee, \$5.

Single Trap Shoot for Amateurs, 9 o'clock A. M.—To be competed for by those who have never won a prize at a State shoot; shot limited to 14 ounces; ten single birds. First prize, a Gold Hunting-case Watch; donated by the Oswego Board of Trade. Second prize, one of Parker Bros. Double-barrel Shot Guns. Third prize, Single-barrel Breech-loading Shot Gun; donated by J. Stevens & Co., Chicopee Falls, Mass. Fourth prize, pair Sleeve Buttons, bird design, solid gold. Entrance fee, \$5.

Single Trap Shoot, 11 o'clock A. M.—Four prizes, for first, second, third, and fourth classes of shots; open only to members of organized clubs and county delegates from this State; shot limited to 14 ounces; otherwise, in accordance with the rules of the New York State Association. First prize, a Gold Hunting-case Watch; donated by the Oswego Lumbermen. Second prize, Silver Pitcher and Cup, mounted; donated by Jules Wendell, Oswego, N. Y. Third prize, Oswego Starch Factory prize, four boxes T. Kingsford & Son's celebrated Starch, 160 pounds. Fourth prize, the "Climax" Patent Paper Shell Creamer, Loader, and Cap Expeller; donated by Wm. B. Hall, Lancaster, Penn. Entrance fee, \$5.

FOURTH DAY, Thursday, June 25th—Double Bird Shoot, 9 o'clock A. M.—Four prizes, for first, second, third, and fourth classes of shots, at ten double rises each; shot limited to 14 ounces; open only to members of organized clubs and county delegates from this State, to be governed by the rules of the New York State Association. First prize, one of Remington's Double-barrel, Breech-loading Shot Guns, with case; donated by E. Remington & Sons, Ilion, N. Y. Second prize, a case (24

pounds) of Oriental Falcon Ducking Powder; donated by A. B. Young, Agent Oriental Co., of Buffalo, N. Y. Third prize, *Turf, Field, and Farm* Cup. Fourth prize, Parker's celebrated Cartridge Belt. Entrance fee, \$5.

Single Trap Shoot, 1 o'clock P. M.—Four prizes, for first, second, third, and fourth classes of shots; open only to members of organized clubs and county delegates from this State, at ten single birds each; shot limited to 14 ounces; otherwise, in accordance with the rules of the New York State Association. First prize, one of Parker Bros. best Breech-loading Shot Guns; donated by Parker Bros., West Meriden, Conn. Second prize, FOREST AND STREAM Vase, solid silver, with case. Third prize, a Pocket Rifle; donated by Frank Wesson, Worcester, Mass. Fourth prize, Silver-mounted Revolver; donated by the Whitney Arms Co., of Whitneyville, near New Haven, Conn. Entrance fee, \$5.

FIFTH DAY, Friday, June 26th—Press Shoot, 9 o'clock A. M.—Open to all members of the press; five single birds each; for best and poorest classes of shots. Best shot, a Telescope, Compass Head Cane; donated by Jules Wendell, jeweler, Oswego, N. Y. Poorest shot, five gallons deep rock water.

GRAND STATE PRIZE—The Dean Richmond Cup, 11 o'clock A. M.—Open to all organized clubs of this State, members of the State Association. And to become the property of a club the cup must be won by that club three times, and is to be held by the winning club each year in trust, to be accounted for to the State association until it is finally won.

To be shot for by three representatives from each club, of twenty single birds each; shot limited to 14 ounces; otherwise, in accordance with the rules of the New York State Association. Entrance fee, \$50 per club of three members, residing in the county where such club is located.

AVERAGE PRIZES.—A pup from Llewellyn's Kennels, of the Field Trial Breed, donated by W. F. Parker, editor *American Sportsman*, West Meriden, Conn., will be awarded to the person entering and making the largest score in the three regular shoots, namely—Third day, 11 A. M., single trap shoot; fourth day, 9 A. M., double bird shoot; and 1 P. M., single trap shoot.

Also, a Buffalo's Head, mounted; a fine ornament for a club room, donated by W. F. Parker, editor *American Sportsman*, West Meriden, Conn., will be awarded to the club making the best average *pro rata* shooting in the above named regular shoots.

BENCH DOG SHOW.—A new feature of the convention this year will be a bench show of sporting dogs. Prizes to be confined to setters, pointers, and spaniels. Open to the United States and Canada, governed by English rules. Entrance fee, \$5. First prize, 50 per cent. of entrance fee; second prize, 30 per cent.; third prize, 20 per cent. Entries close Thursday, June 25th, at 12 M.

The club have an oil painting, valued at \$1,000, donated by L. W. Prentice, of Syracuse, N. Y., which will be offered as a prize at the State Trap shoot, under the direction of the convention.

The *Detroit Tribune* informs us that some 11,000 live pigeons arrived there lately, to be used at the Oswego Convention. The great roost of these birds is near Crystal Lake. Before remaining in one fixed spot they had been wandering around in Oceana county, where they had been collected by the thousands. There are men who make pigeon catching a business, being supplied with nets and all paraphernalia necessary to entrap and catch the birds. They get track of a flock of pigeons early in the Spring in the South, and being acquainted with their habits, are able to follow them the whole year. Wild pigeons are worth from \$1 to \$1 50 per dozen.

The Kennel.

—THE ACTION OF THE CITY IN REGARD TO THE DOGS.—We would advise the careful reading of the following memorandum furnished by the Sanitary Committee, in regard to the symptoms of Hydrophobia:—

Hydrophobia is a disease peculiar to animals of the canine and feline races, the dog, wolf, fox, cat, &c. Its origin, except by actual inoculation, is unknown. It may be inoculated by licking a raw surface as well as by a wound with the tooth. Its occurrence and prevalence are not materially affected by the seasons of the year, nor by climate. It is perhaps slightly more frequent in the spring months, but it occurs alike in the coldest regions of Canada and the hottest districts of the East and West Indies. Of those bitten by animals known to be rabid but a small percentage are affected, namely, five to twenty per cent. This is largely due to the fact that the saliva of the rabid dog is so far removed by the hair of the animal or clothes of the person bitten that none of it enters in the wound. The male dog is far more liable to be affected than the female. Pet dogs confined to the house and family are as liable to develop hydrophobia as dogs at large. The muzzling of healthy dogs and those allowed in the street, is at best a most imperfect preventive measure. If the animal is rabid he can readily inflict a wound with the metallic muzzle, and thus inoculate the victim. If he is not rabid the muzzle will prove a species of cruelty and annoyance far more likely to produce canine madness than to protect against it. It would prove far more effective against the nuisance of the roving herds of vagrant curs in our streets if the ordinance forbade any dog in the street which did not wear a collar having the owner's name and residence engraved upon it. It might also prove of much service if the public were better informed as to the early symptoms of hydrophobia in the dog. These symptoms are thus given by an eminent veterinary surgeon:—

"There are premonitory signs of an attack of the disease in the dog. When the period of incubation (three to seven weeks) is passed, the animal is restless, dull, watchful, and snaps at dogs, other animals, or men, which come in its way. It shuns the light, but with much slyness seeks an opportunity of escape, and roves about town or country, manifesting extraordinary powers of exertion and marked insensibility to blows and ill-usage. The habits of an animal may not change completely at first, and the recognition of persons it has been daily in contact with is sometimes very remarkable. The dilated pupils, the manner in which the eyes follow any object moved before them, and the peculiar modification of the bark, which is more of the nature of a howl, are among the characteristic symptoms. The appetite is lost, thirst often considerable, and the animals usually drink without difficulty. The coat is staring, skin-tight on the ribs, abdomen tucked up, head depressed, and nose protruded, with a dirty mouth and tongue, and sometimes a discharge of mucous and saliva from the sides of the mouth. In a certain number of cases the nervous symptoms are very prominent at this period, and the lower jaw drops from paralysis of the muscles connected with it. The howl is then lost, hence the name of dumb rabies. Emaciation and craving after filth, which is swallowed with some difficulty, are among the noticeable symptoms. There is a singular absence of any marked acceleration of the pulse and breathing during the disease; the animal sinks, often paralyzed in the hind quarters, and dies somewhat tranquilly from the fourth to the eighth day."

With this excellent explanation of the character of the disease, and the perfect worthlessness of muzzling the dogs proven, the action of the present law, in the city, as

proposed by Mr. Morris, and carried out by Mr. Have-meyer, has met with a most decided disapproval.

The award offered of 50 cents for the capture of dogs, has had the worst results. The *Sun* mentions a case, where some ruffian boys absolutely stabbed a lad having a dog tied with a string to a collar, in order to steal a little Scotch terrier. There is not the least doubt but that the whole neighborhood of the city has been scoured by rascals, who have taken and stolen dogs, bringing them from the country to New York in hopes of acquiring the offered reward. The disgusting scene of last week, where a noisy, low and degraded crowd assembled around the pound in West Thirty-seventh street, we trust will not be repeated. It is questionable whether the voluntary help given by the worst elements of a city does not do more harm than even the spread of rabies in dogs. As for the animals themselves, we congratulate the city that Mr. Bergh's most humane efforts spared the dogs a great deal of cruelty. The arrangements to kill the dogs seem to have been bunglingly carried out, entailing a great deal of unnecessary suffering, which even a moderate degree of common sense would have prevented. Last Saturday about half the dogs to be killed were put into a tank, the lid was shut, and carbonic acid gas was poured in. It was warranted to kill in twenty seconds, but it took twenty minutes to silence the quadrupeds. Then they were loaded on a cart, and after the driver had driven off several revived and escaped. There have been many able articles written in regard to this subject of late by the city press. We would particularly call attention to an excellent article to be found in the *New York Times* of Saturday last, which contrasts with another production of a leading paper, written in a coarse and vulgar style, and in the worst possible taste. We are by no means squeamish over such subjects, and believe that there are innumerable curs in the city, whose death would be an advantage, but to gloat over the miserable scenes of their destruction, is not to our taste, and is inclined to deaden the public feeling in regard to cruelty towards animals.

For a most careful analysis of hydrophobia, the character of the disease, the methods of cure, and the general history, we refer with pleasure to an exhaustive paper which appeared last Saturday, from the able pen of Mohawk, in our excellent contemporary, the *Turf, Field and Farm*.

To conclude this subject of hydrophobia, we believe that there is less danger to come from hydrophobia than in the past month, and that even then the cases recorded were rare. At present there is a kind of mental epidemic in peoples' mind, who we think are much more mad than the poor dogs.

ALLEGED CURE FOR HYDROPHOBIA.—In the *British Medical Journal* Mr. Prince, of Tunbridge Wells, gives an account of what appears to be a cure for hydrophobia. Mr. Prince reported twenty cases of persons bitten by mad dogs, in the above journal of 19th October, 1872. Of these twenty cases, eighteen had this medicine administered to them, and no ill effects resulted from the bite; but the other persons refused to take it, and both died of hydrophobia. Some years since, a number of cows and twenty pigs were bitten by a mad dog in the parishes of Uckfield and Horsted. All these animals were successfully treated by this medicine, with the exception of one of the pigs, to which it was not given, because there was no evidence to show that it had been bitten; but shortly afterwards this animal died mad—the only one out of the twenty. The ingredients of the formula, as given in Mr. Prince's own words, are as follows: "A small handful of tree-box, a small handful of toad-flax, three hands of foetid hellebore or setterwort, a small handful of primrose-roots. These are to be boiled in a quart of new milk down to a pint. The decoction is then to be strained, and, when cool, any skim is to be removed. The following are then to be added: Gascoigne powder, three drachms; and two drachms each of jalap and carbonate of iron. I have ascertained that the handful each of box tree and toad-flax means that you are to take about three or four inches of the terminal branches, with the leaves on, of the box-tree, and as much of the stem of the toad-flax as possesses leaves and flowers. This in weight of the dried herbs is, of box one ounce, and of toad flax six drachms. Three hands of the hellebore mean three entire leaves with the axil, which, when dried, weigh about two scruples. The primrose-roots, I was informed, were not essential, and had been omitted for some years. I would suggest, however, that in place thereof the ground liver-wort should be substituted. In a more tangible form, the formula should appear as follows: R. Buxi sempervi foetidi, one ounce; antirrhini linariae, four drachms; hellebori foetidi, two scruples; lichenis cinerei terristris, three drachms. Powder the dry, or bruise the green herbs in an iron mortar; put them into a quart of cold milk and boil down to a pint; strain while hot, skim when nearly cold, and then add pulv. gascoigni, four drachms; pulv. jalapae, ferri carbon, sing., two drachms, M. One-third part of this mixture is to be taken on three consecutive mornings, fasting." *Land and Water* states that the tree-box forms one of the chief ingredients in what is known as "Webb's Remedy," or the "Hertfordshire Drink," a remedy favorably noticed by Blaine. It is also one of the oldest reputed preventives of hydrophobia made use of, and is mentioned in the writings of Galen, Hippocrates, and Celsus.

Hydrophobia is on the decrease in England, though all the necessary precautions are being taken in regard to dogs. Among the numerous specifics mentioned is one taken from the *Irish Times*, where poultices of hot salt were employed. As for ourselves, we are skeptical about all these cures. We only place confidence in the heroic treatment, which is deep incision, nitric acid, and the use of poultices, as recommended by Dr. Yarrow in the *FOREST AND STREAM*.

—Instead of muzzles for dogs, Prof. Gamgee proposes an apparatus projecting beyond the upper jaw, so as effectually to prevent the dog from biting, unless, shark-like, he

turned on his back, and then the object to be bitten actually fell into his mouth.

—We have answered repeated inquiries for prepared dog food, referring our friends to Messrs. Spratt, of London, England. They will now be glad to learn that the proprietors have opened an agency for the sale of their dog biscuits at 39 Beaver street, this city, where samples may be obtained. We also expect soon to receive a promised consignment of two cwt. of these biscuits for trial. When they arrive we will notify our friends, who we hope will come and test them.

—The State Sportsmen's Association of Tennessee, whose organization we had occasion to mention and commend some weeks since, will hold an exhibition and tournament at the Agricultural Fair Ground, at Memphis, next 7th October, continuing four days. There will be a bench show of setters and pointers, and a field trial, with handsome prizes given for the best working pointer or setter, to be followed by a pigeon tournament, and various other matches, all under the supervision of the Association. We printed a list of the officers of the Association in a previous number.

DOGS DROPPING TO SHOT.

EDITOR *FOREST AND STREAM*:—

It was remarked to me a few days ago by a prominent sportsman of Philadelphia, that since the invention of breech-loading shot guns we have fewer steady dogs at the charge than heretofore, and the reason given was that the reloading of the breech loader took such a short time the dog naturally forgot the necessity of dropping to shot, more from the fact that the sportsman himself, anxious to make a large bag, moved forward at once as soon as he had recharged. In old times when we used the ramrod it took some minutes before the sportsman was in readiness, and during this time his dog remained charged and steady, until his master had reloaded; this practiced him in obedience and staunchness. In conclusion my friend said to me: "Mark what I say, and I wish you to note it, the man that still uses a muzzle-loader has the best trained dog."

I confess I see some reason in what my friend said, but do not know why one can not be particular in this branch of the dog's tuition, and be more on his guard to have his setter obey him in this particular. It is a common fault in the hurry of the moment and excitement of being among a bevy of quail, to push forward too quickly after killing a bird and paying little attention to the dog. Your four-footed companion will soon take advantage of the liberty unintentionally given him and forget entirely that part of his education which is so necessary to good sport and success in the field.

I find a great many of my friends are training their dogs to come in before charging, and they give me as a reason that in cripple shooting, woodcock shooting and the like, it is far better to have your setters come to you and charge, that you may know where they are before starting them for fresh game. I do not see the utility of the method, especially in the case of a retriever, for in the usual manner of breaking dogs your setter charges at the report of the gun and remains so until he is ordered to seek and bring the birds to you. "Homo."

Shot Gun and Rifle.

JUNE IS A CLOSE MONTH FOR GAME.

Details of pigeon shooting and scores of rifle matches, and other interesting matter, should be mailed so as to reach this office on Tuesday morning in each week.

THE PERSONNEL OF THE IRISH TEAM.—Having requested Major A. B. Leech to give us some idea of the age and professions of the Irish team, in order to satisfy a great deal of natural curiosity on this subject, he has very kindly sent us the following:—

1. Mr. Young is an Irishman who has spent many years in India, and now resides near London, and is about thirty years old, his first appearance in the Eight.

2. Mr. Milner is twenty-six years old and is a wool merchant, the son of our one of oldest and most respected Dublin citizens.

3. Mr. Lloyd of Gloster House in the Kings county, is a country gentleman of large fortune, a Deputy Lieutenant and Magistrate for his county and about thirty-five years old.

4. Mr. J. Rigby is the eminent gun maker who has shot in the Irish Eight every year since we engaged in the match, and is about forty years old.

5. Mr. W. Rigby is his cousin and also engaged in the business, is about thirty-five years old.

6. Mr. Joyce is a merchant in Belfast and has shot in our eight several times; he and Mr. Wilson made in 1871 the highest individual scores (161 each) that were ever made in the international match; he is about thirty years old.

7. Mr. Wilson, who with Mr. Joyce made in 1871 the highest individual scores, (161 each), ever made in the international match, is also a merchant in Belfast, and is about thirty years old.

8. Mr. Johnson is the well known jeweller of Grafton street in this city, and is also about thirty years old.

Of course they are all Irishmen, otherwise they would be ineligible to represent Ireland at Wimbledon in the great international match. Mr. Young and Mr. Johnson shoot for the first time this year.

A. B. LEECH.
Dublin, May 1874.

From the *Irish Times* of May 27th, we take the following notice of a late meeting of the Irish Rifle Association:—

"The council of the Irish Rifle Association had nothing but successful efforts to record, and pleasant results to anticipate, at their meeting yesterday. Their American competitors agreed to all necessary formalities in the kindest and most friendly spirit. The great international match is to be fought in the last week of September, for our American friends wish to give the Irish team the chance of a double victory. As the annual prize meeting of the National Rifle Association will be held during the first week in October, the Americans determined to afford the Irish team an opportunity of entering the lists at the contest open to 'All Comers' at Creedmoor. The Irish party engaged in the match will consist of fifteen persons: there is the shooting team of eight, with two spare men; four gentlemen to assist at the butts and to register the score,

and Major Leech, who ought to be proud of the success of his untiring exertions. Four volunteers were at once found, as soon as it was intimated that their services would be required. Lady Massereene has chivalrously decided to accompany with Lord Massereene the Irish team, and in the same vessel. If anything was required to inspire the Irish team it is found in the presence of Lady Massereene. We are very happy to say that the subscription to defray the travelling expenses of the champions who undertake to maintain the honor of Irish Rifle men, is also a success. Yesterday a cheque for £20 to defray incidental expenses was handed in from Lord Massereene, another from Lord Cairns, Lord Chancellor of England, for £10 to the funds of the Association; a third from the Earl of Dunraven for £10; a fourth from the Earl of Kingston for £10; besides several contributions intended to aid the prize fund for the Dollymount meeting next month. The Lord Mayor very properly noticed the fact that "the Irish Rifle Association is managed by gentlemen whose unostentatious labors have produced wonderful results without any cost to the public, all the money subscribed being given in prizes, save £20 yearly for the rent of an office." Altogether we heartily congratulate the association on all it has achieved, and confidently trust that the past is only the prelude to even more brilliant success."

—A REMARKABLE OCCURENCE.—Five gentlemen in practice at Creedmoor Friday afternoon, after shooting at 800 yards range, went back to the 1,000 range, and each one firing his first shot at this range made a bullseye. Rifles used, four Sharps and one Remington.

—"Texas Jack," (Mr. J. B. Omohundro,) the great rifle shot, was recently in Montreal, in company with W. F. Cody, or "Buffalo Bill," filling a theatrical engagement at Mechanic's Hall, in which they performed the role of Indian fighters and scouts. If Mr. Omohundro intends competing with the Irish team, it is time he gave up his dramatic engagement, and begun practicing at the 1,000 yards range at Creedmoor. We understood, some weeks since, that he had entered for the contest next September.

—We have had sent to us, a target made by the Rev. H. W. F. Jones, of Bergen Point, with a Remington breech loading shot gun, which is an excellent one. Size of paper—18x24 inches. Number of pellets in the target 199, fired at 35 yards. Charged with brass shell, 3 drams powder and 1 oz. shot, size No. 8. Right hand barrel, fired left hand barrel quite as good.

—The "Forest Lake and Villa Park Association," is the name of an organization recently incorporated in this State, with the following strong board of officers:—

Hon. Horatio Seymour, of Oneida, was unanimously elected to the office of President. The following additional officers were chosen: Vice-Presidents—Hon. Levi Parsons, New York; Hon. J. Wesley Smith, Albany; Hon. Daniel Pratt, Syracuse; Hon. Henry A. Richmond, Buffalo.

Treasurer—Arthur B. Johnson.

Attorney and Counselor—C. M. Denison.

Secretary—Charles W. Hutchinson.

Executive Committee—Charles W. Hutchinson, Utica; Robert B. Roosevelt, New York; Thomas R. Proctor, Utica; Arthur B. Johnson, Esq., Thomas R. Proctor, Utica; Hon. Clinton L. Merriam, Lewis county; Hon. Levi Parsons and Hon. Robert B. Roosevelt, New York; Hon. J. Wesley Smith, Albany; William C. Barber, Esq., Auburn; Hon. Daniel Pratt and Hon. George F. Comstock, Syracuse; Hon. William H. Bowman, Rochester; Hon. Henry A. Richmond, Batavia.

This enterprise is in some respects similar to the Blooming Grove Park Association. Its capital stock is fixed at \$200,000, and it has a large tract of land in Central New York, to be used for a natural preserve, with fish and game breeding establishments. Its headquarters are at Utica.

—There has been junketing between the English volunteer and the Frenchman. At the close of last month some hundred English volunteers went over to France, to try a bout of rifle shooting with the *Société Hiveraise de Tir*. A member of the 3d Gloucester won the prize. Frenchmen generally are becoming devoted to rifle shooting.

—We hear that our correspondent, "Piseco" with a Government Navy Remington Carbine, at sixty yards, shot a loon, the ball passing through the bird's neck. What is quite as remarkable as the shot is, that after the bird had his neck broken, he dived several times before he was captured. The shot was made from an open boat. "Piseco" does not, however, brag about his shooting, for it is asserted on good authority that some time ago, when in Casco Bay, he fired at a whale at seventy yards and missed it.

—To track the lion in his fastness is one thing, but to sit on the deck of a fine steamer, under an awning with an obsequious steward at hand, ready to pass you any number of rifles, and to bag any number of lions is a combination of luxuries not often met with. The *Pull Mull Gazette* tells us that on the 19th of March the passengers and crew of the City of London, of the Euphrates and Tigris Navigation Company, had a successful lion hunt. The country having been overflowed, three full grown lions were seen walking along the shore, and in time all three were killed. The dimensions of the largest lion was nine feet six inches in length, from the head to the tail, height three feet ten inches, and his weight was 430 pounds. A like incident, it is declared, has never occurred before in this part of Mesopotamia. This puts alligator killing in the St. Johns by the passengers of steamers, considerably at a discount.

—The Sportsmen's Club of Taunton, Mass., which organized some time since, is in a very flourishing condition. They have had several days of sport, the club using the spiral iron pigeon.

Jas. N. Davis, Jr., of the General Post Office, Washington, D. C., has been recently elected Secretary of the National Sportsmen's Club, vice M. A. Tappan, resigned.

—The Tremont Club of Boston, had their annual pigeon shoot at Readville, Thursday, June 11th. About fifty were present and sides were chosen to shoot for the payment for the annual dinner. Messrs. Tonks and Simmons were the leaders, and the latter side won, shooting 141 birds and the other 125. Mr. Gates made a clean score, and Messrs. Haskell, Hayden and Falls each shot nine of the ten birds.

—At Dexter Park, Chicago, on Monday last, a pigeon shoot took place for the benefit of Miles Johnson, of New Jersey, who was compelled by sickness to raise money for the Diamond Medal, given to him for excellence in double bird shooting. On this occasion Captain Bogardus very kindly offered his services, and was to contribute any stakes won by him for the benefit of Mr. Johnson. Captain Bogardus offered to shoot at twenty-five pair of pigeons, to kill thirty-eight from two plunge or spring traps, forty yards apart, the shooter to stand on a line between the two traps, both traps to be sprung at the same time.

—It is on the *tapis* that this week the Kennicott and Prairie Clubs are to shoot at a pigeon match, the challenge having come from the Kennicott Club.

EDITOR FOREST AND STREAM:—

The first match of the season for the Forest City Shooting Club was held on their grounds in Deering, to-day, and as there were three medals to be contested for, the members were handicapped at 25, 23 and 21 yards. The day and the birds were good, with a stiff breeze blowing from the stand towards the traps. I send you herewith the score at

25 YARDS.					
Name	Hits	Name	Hits	Name	Hits
W. Senter	3	J. H. Fitzgerald	6	M. Sullivan	1
C. Day, Jr.	4	L. Daniels	1	H. C. Harmon	6
F. Merrill	4	J. N. Martin	5	M. A. Hastings	4

The ties were shot off with the following result:
At 30 yards—C. M. Wormell, 1 1 1, taking first prize.
H. H. Wilder, 1 1 0 1, taking second prize.
H. C. Harmon, 0 0 0 1, taking third prize.
J. H. Fitzgerald, no birds.
W. Noyes, no birds.
Scorer—Mr. W. N. Wood, of Maine Shooting Club. Referee—Mr. J. H. Murdock, of New Hampshire.
Yours, &c. F. W. S.

EDITOR FOREST AND STREAM:—

Since it has been decided by the courts that pigeon shooting is contrary to law, the Woodside Shooting Club have reorganized under the name of the Woodside Shooting Association of Woodside, Long Island. The Association have purchased a large tract of land at East Moriches, near the Great South Bay, L. I., and are now receiving estimates for the new club house, which they purpose to erect immediately, so as to be ready in season for the fall shooting. Yours respectfully,
W. T. CAMERON, Sec. W. S. A.

EDITOR FOREST AND STREAM:—

Enclosed please find a score made Saturday, by three members of the Niagara Falls club; twenty wild birds each; State rules:—
S. T. Murray.....1 1 1 1 1 1 0 1 1 1 1 1 1 1 1 1—19
J. M. Whittier.....1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1—19
R. O. Fulton.....1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1—19
[The above is a remarkable score, not only for the number of birds killed, but for the equality of the marksmen and the closeness of the contest.—Ed.]

EDITOR FOREST AND STREAM:—

A pigeon match took place at Dexter Park, Long Island club grounds, on Friday, June 12th, between Messrs. Post and Livingston, at 50 birds each, 33 yards rise, use of both barrels, \$500 a side. Day fine, and the meeting of gentlemen large. Mr. Post killed 42 out of 45. Mr. Livingston killed 36 out of 44. The birds were of fair quality only.
On same day match for championship at Dexter club ground between Mr. Charles Wingert and Captain Elmendorf, at 10 birds each, 21 yards rise, Long Island rules. Birds good and strong flyers. Mr. Wingert killed five straight, missed one, and then killed four. Mr. Elmendorf missed the first, killed three straight, missed the fifth, killed the sixth missed the seventh, and killed the next three straight. NED.

THE DANGER OF CARRYING METAL SHELLS.

EDITOR FOREST AND STREAM:—

Who that has ever learned to shoot does not remember the many charges of anxious friends to be careful in handling the gun, and never allow the muzzle to point towards ourselves or our companions. No one doubts the correctness of advice as to the careless handling of guns, and yet how many persons unwittingly disregard it in carrying loaded metal shells about their persons when shooting breech-loaders. The strength of metal shells is sufficient, were one accidentally discharged, to withstand the force of the charge of powder, rendering the explosion of one about the person serious business, and endangering life. Does it pay to take the chances of carrying such dangerous articles as loaded metal shells about the person, when by using paper shells the explosion of the powder in one would destroy the shell itself and expend its force with but little or no risk? CHECK COUD.

—Washington *Herald* says that Capt. M. A. Tappan, President of the Sportsmen's Club of Washington, will go to Oswego to introduce to the notice of the State Convention the "patent pigeon," recently invented by himself.

—The Birmingham gun trade shows a decrease of barrels manufactured in 1873. During the past year 756,056 barrels were proved, which was less almost by 60,000 than for the previous year. The Birmingham gun trade have a museum and a library of their own, and their collection contains specimens of arms dating from the beginning of the 17th century down to the present time.

Packting and Boating.

—The Regatta of the Atlantic Yacht Club sailed on Wednesday, the 10th inst., was not the success which the fine breeze of the early morning gave promise for. The Magenta, with the invited guests of the club and the Wm. Fletcher, with the judges and reporters, left Martin's wharf Brooklyn, at about ten o'clock in the morning, and steaming down the bay reached the starting point half an hour after, where according to the programme the sloops were found at an anchor and the schooners standing off and in waiting for the signal to cross the line. At this time a pleasant breeze was blowing and every one anticipated a delightful day's sport, but unfortunately the wind kept pegging out and when the yachts were fairly started there was hardly sufficient to keep steerage way on, and the vessels pointed for the first turning point, the stake boat anchored of the southwest spit buoy. On the drift down with the ebb tide the yachts kept well together, the little Barbara Freitchie close up in the vicinity of the Orion, Triton, Peerless and Agnes. The few cat's paws which came to the assistance of the yachts, being from the westward, the Recreation availing herself of them and showing marked speed in so light an air, crawled out to windward of the fleet and found herself left hopelessly astern when, approaching the stake boat, the wind such as it was, hauled to the eastward. The Anna passing the stake boat first, was leading the Orion some little distance which in her turn was ahead of the schooners and the balance of the yachts. And at this point all semblance to a regatta ceases, the only boat which completed the course in the required time of eight hours being the open yacht Flyaway. She alone will receive a prize, as will be seen by the decision of the judges which we append.

To Mr. Davenport and others, Regatta Committee of the Atlantic Yacht Club:

The undersigned, your judges, respectfully report that they attended the regatta of this Club on Wednesday, June 10, 1874; that the signal for schooners to start was given at ten minutes of eleven, and that the schooner Agnes passed between stake-boats at 10h. 51m. 4s., followed by the Triton at 10h. 52m. and by the Peerless at 10h. 52m. 35s.

That the first-class sloops got under way at fifty-four minutes past ten, as follows: Anna, Barbara Freitchie, Ida, Jennie M., Kate, Orion, and Recreation; that the Kaiser W., having got foul of her yawl's painter, did not start.

That of the second-class sloops the Flyaway was the only one of the three entered that started: that the time of passing the stake-boat off the southwest Spit was as follows:

H. M. S.	H. M. S.
Anna.....2 15 16	Peerless.....2 45 10
Barbara F.....2 27 15	Ida.....2 45 40
Jennie M.....2 30 40	Agnes.....2 47 59
Orion.....2 37 50	Recreation.....2 49 25
Triton.....2 44 57	Kate.....2 54 00

That the Anna passed the stake-boat off Gedney's Channel at 4h. 18m. 45s., and the Orion at 4h. 55m., but in passing was drifted upon and against the stake-boat; that the other boats of that class passed at long intervals, but that the time was not taken by your judges.

That the Flyaway sailed the course within the time limited by the Regatta Committee, and we are of opinion that there is no race of that class.

That no schooner having made the race in eight hours, there is no race of schooners. (Vide R. and S. Reg., Rule VI., p. 51.)

That your judges waited on the stake-boat till half-past nine, when no yacht of the fleet was in sight and it was too dark to distinguish one yacht from another passing between the stake-boats.

All which is respectfully submitted.

WILLIAM PEET,
WILLIAM H. THOMAS,
R. S. CHURCH.

—The Regatta of the New York Yacht Club on the 11th was much favored, a strong breeze blowing from the eastward, and although there were occasional spurts of rain, it is questionable whether even the ladies' on the club steamer would have had it otherwise, as from the dirty look to the southward and eastward there was every indication of a race, not a drift. According to instructions of the Regatta Committee, the start was to be from an anchor, and as the time for the start approached the yachts took their places in the lines assigned for the different classes. It now became apparent to the Committee that with the strong ebb tide running, and the southing in the wind, it was impossible for the schooners to await the starting signals with sails hoisted, so they were ordered down. It would have been well if the sloops had been favored with similar instructions, for eventually the Qui Vive fouled the Vision from the utter impossibility of keeping in position, and the friends of many of the sloops became uneasy for fear they would be ruled out, as they were going broadside bodily to windward with the tide—the cable and spring picking up the anchors and walking off with them with considerable celerity. The sloops at this time had no head sails on them, and in most cases had their peaks lowered. The position of the schooners as aligned was as follows:—From the upper stake-boat and in a line west of her, lay the Cornelia, Idler, Clio, Magic, Eva, Phantom and Tidal Wave. The sloops were anchored in another line, a little distance to the southward of the schooners, and there were found the Vision, Gracie, Vindex, Qui Vive, Wayward and Dudley.

At 11 hours 20 minutes 30 seconds the second gun, the signal for starting, was fired, and before the smoke had fairly cleared away, many of the yachts were already under way. Standing off on the starboard tack the sloops held on only sufficiently long to clear the stake-boat, when they went round and headed for the S. W. Spit. Of the schooners the Cornelia was the first off, followed by the Idler, Phantom and the rest, the Tidal Wave being the

last. Passing through the Narrows the Gracie was leading the sloops, followed by the Vindex, Vision, Qui Vive, Wayward, Dudley, while among the schooners the Idler showed to the front, the balance of them being pretty well bunched.

Shortly after the start the Vindex parted some of the iron work aloft which was secured to the upper block of her throat halliards. However, this mishap was soon repaired without changing her relative position, but hardly had the whole sail been gotten on her once more when the mast-head went, virtually putting her out of the race. This was a disappointment to many, as the entire interest in the first-class sloop race was now gone, the Gracie showing from the start her superiority over the Vision, her only other competitor, in such a breeze as was then blowing.

Ahead of the racers at this time were the Tarolinta, Foam, Rambler and others, and as the fleet passed West Bank they got a little puff of wind, accompanied by rain, which occasioned some of the smaller vessels to reef. The Tidal Wave had decreased the lost distance occasioned by the bad start, and as the yachts neared the Spit she was seen coming down at a great pace, with the Madeleine on her weather quarter. The Tidal Wave since her alterations of last winter seems to have the legs of the Madeleine however.

The following is the time of turning the Spit buoy:—

H. M. S.	H. M. S.
Gracie.....12 7 10	Eva.....12 16 11
Vision.....12 10 48	Tidal Wave.....12 16 35
Idler.....12 11 41	Cornelia.....12 19 14
Magic.....12 13 46	Qui Vive.....12 21 43
Phantom.....12 13 55	Wayward.....12 26 30
Clio.....12 15 37	Dudley.....12 27 11

From here to the Light Ship was a dead beat, but as the Gracie got outside the point of the Hook she met the incoming flood tide which smoothed the water considerable. The Idler had mean time gone through the lee of the Vision and taken second place. The Idler all through the day sailed remarkably well, and carried her canvas admirably. The Tidal Wave, however, was too large for her, and was perceptibly gaining, while the Gracie still held her lead notwithstanding the power of her adversaries, and was going to windward in a manner which was wonderful. The Vision, from the moment she encountered the head sea, had been doing badly, and had fallen far astern. The following are the times of rounding:—

	<i>H.</i>	<i>M.</i>	<i>S.</i>		<i>H.</i>	<i>M.</i>	<i>S.</i>
Gracie.....	2	35	44	Phantom.....	2	47	40
Tidal Wave.....	2	41	52	Magic.....	2	58	00
Idler.....	2	44	42				

Starting back for the Southwest Spit, the Idler was crowded with canvas in order to save her time on the Tidal Wave, but all without avail. Only four yachts were timed at the Southwest Spit, when returning, which were as follows:—

H. M. S.	H. M. S.
Tidal Wave.....3 31 31	Idler.....3 35 50
Gracie.....3 31 50	Phantom.....3 39 19

Returning from this mark the Vindex, which had cleared away her wreck and had been over as much of the course as possible in the time, was seen reaching up under a try-sail, four stay-sail and storm jib, and making only creditable speed. The Idler shortly after hauling up for the home stake-boat lost her jib-boom and her chance for saving her time for the Challenge Cup, which goes to the Tidal Wave. The following is the time of returning:—

FIRST CLASS SCHOONERS.					
Name.	Start.	Finish.	Elapsed Time.	H. M. S.	H. M. S.
Tidal Wave.....	11 20 30	4 9 40	1 49 10		
Idler.....	11 20 30	4 19 44	4 29 14		
Phantom.....	11 20 30	4 29 37	5 00 07		

SECOND CLASS SCHOONERS.					
Magic.....	11 20 30	4 31 43	5 11 13		
Clio.....	11 20 30	4 51 39	5 31 9		
Cornelia.....	11 20 30	5 10 00	5 40 00		

FIRST CLASS SLOOPS.					
Gracie.....	11 20 30	4 19 27	4 58 57		
Vision.....	11 20 30	4 56 46	5 36 16		

SECOND CLASS SLOOPS.					
Wayward.....	11 20 30	5 50 32	6 30 2		

And the rest were not timed. Thus the Tidal Wave wins in her class, beating the Idler ten minutes and four seconds, the Magic in her class beating the Clio in nineteen minutes fifty-six seconds, the Gracie in her class beating the Vision thirty-seven minutes nineteen seconds, and the Wayward in her class being the only yacht timed

—The Columbia Yacht Club sailed its annual regatta on Monday, 15th, a good race, although the wind was light at the start. On the home stretch the smaller craft had all the wind they could stand up under. The course for cabin, first and second-class boats was from the stake-boat anchored off the foot of Forty-seventh street, North River, to the stake-boat off Mount St. Vincent and return; for the third class boats from the same starting point to stake-boat off Spuyten Duyvel and return. The start took place at 11.15, yachts entering as follows:—

CABIN SLOOPS			Feet.
Name.	Owner.		
John S. Gage.....	D. C. Beardsley		41. 7
W. H. Hamilton.....	J. S. Gage		39. 7
Undine.....	Brockway and Man.		37. 4
Elizabeth Rowe.....	W. H. Rowe		32. 10
Commodore.....	George Roahr		33. 8

FIRST CLASS OPEN SLOOPS.			Feet.
Lillie.....	J. A. and R. H. Weaver		30. 2
Journeymen.....	R. McWhinney		28. 8

SECOND CLASS OPEN SLOOPS.			Feet.
Bonita.....	B. Tripler		24. 5
G. W. Dilks.....	J. Nobus		22. 10
Annie L.....	Freeman and Gannon		22. 9
G. B. Deane.....	George Roahr		22. 4

THIRD CLASS OPEN SLOOPS.			Feet.
Annie.....	J. A. Schultze		18. 6
Columbia.....	E. H. Osborne		17. 4
Engaboo.....	W. Deans		16. 9
Tough.....	Benjamin Carr		15. 7

The Journeymen came home the winner, the Commodore arriving at 5.45; the Tough at 5.47; the Hamilton at 5.55, and the Deane at 6.04. Prizes were awarded to the Journeymen, Deane and Tough. Some objections were made against the Commodore on the ground that she had raised the portable sides of her cabin, not making her a cabin boat, and putting her out of her class. This objection is not, we believe, likely to stand, and we await the decision of the judge in regard to it.

THE LONG ISLAND YACHT CLUB.—The second annual and first union regatta of the Long Island Yacht Club will take place from the foot of Thirty-seventh street, South Brooklyn, June 18. The regatta committee have adopted the following programme:—

In addition to the club prizes for each class, there will

be a union prize given to the winning yacht in each class on time allowance; the yachts of the club reserving the right to compete for the union prize in addition to the club prize.

The course for the first class (schooners) and second class (cabin sloops) to be from a stake boat off the Club House to and around the Southwest Spit buoy, rounding the same from west to east; thence to and around the buoy at Gedney's Channel, rounding the same from south to north; thence to the home stake boat, passing to the west of Romer Shoals Beacon and Fort Lafayette, and to the east of the West Bank buoys, both going and returning.

The course for third class (open boats) to be from the stake boat off the Club House to and around the Southwest Spit buoy, on Robbins reef, rounding the same from north to south; thence to and around a stake boat off Bay Ridge dock, rounding the same from south to north; thence to and around the home stake boat, rounding the same from east to west; thence again over the same course in like manner, finally passing to the east of the home stake boat.

All yachts to pass to the starboard of the home stake boats.

All yachts to be in line by ten o'clock sharp on the morning of the 18th, the first and second class in line one hundred yards south of the third and fourth class, and fifty yards apart. Position will be assigned each yacht in the order of arrival by the regatta committee.

First gun to get ready, second gun for the first and second class to start, and third gun for the third and fourth class to start.

If any yacht in either class sails the course over within eight hours it will be considered a race for each class.

Regattas to be sailed under the regulations adopted by the Long Island yacht club.

The annual regatta of the Philadelphia Yacht Club took place on Monday, June 15. The perfect calm that prevailed marred the beauty and excitement of the contest. The race was a drift one from the buoy at Delanco and half way on the return, when a breeze sprang up about 4 p. m., and the yachts came in as follows:—
1st Class—Albert T. Eggleton, Albert Deger, Geo. Hoff, Chas. S. Austin, Willie Kleintz. *2d Class*—Richd. F. Riddell, Jno. B. Brewer, Chas. Able, S. A. Mariner, Jos. H. Leary. Owing to the violation of the rules of the race by several of the yachts, the decision of the judges was postponed.

The city of Boston has appropriated \$1,500 for a sailing regatta, and \$1,500 for a rowing regatta, to take place on the coming ninety-eighth anniversary of American independence. These regattas, which are annually given under the auspices of the city on each recurrence of the "glorious Fourth," are open to all, and have always been successful, and attract crowds of spectators.

The Committee on the Sailing Regatta have arranged the following programme:—

First race, for sloops and schooners measuring thirty-eight feet and upwards on the water line; prizes—for sloops, first prize, \$150; second prize, \$75; for schooners, first prize, \$200; second prize, \$100.

Second Race—For centre-board and keel sloops and for schooners measuring 25 feet and less than 28 feet. Prizes—For centre-board sloops, first prize, \$90; second prize, \$50. For keel sloops, first prize, \$90; second prize, \$50. For schooners, first prize, \$90; second prize, \$50.

Third Race—For centre-board and keel boats measuring 20 feet and less than 25 feet. Prizes—For centre-board, first prize, \$70; second prize, \$70; third prize, \$25. For keel boats—First prize, \$70; second prize, \$35; third prize, \$25.

The sub-committee on the rowing regatta decided to have five races, beginning at 3 o'clock P. M. The programme will be as follows:

First Race—For single-scutt wherries; distance, two miles. First prize, \$150; second prize, \$50.

Second Race—For Whitehall boats; distance, two miles. First prize, \$50; second prize, \$25.

Third Race—For double-scutt boats; distance, two miles. First prize, \$75; second prize, \$50.

Fourth Race—For four-oared working boats; rowed on the gunwale; distance, three miles. First prize, \$100; second prize, \$50.

Fifth Race—For four-oared boats (lapstreaks or shells)—with outriggers; distance, six miles. First prize, \$350; second prize, \$100.

The prizes amount in the aggregate to \$1,000.

We are indebted to ex-Commodore Alex W. Scott, of the Royal Halifax Yacht Club, for the following programme of events for the current season;

1. June 13—Opening cruise from Club house, through Eastern Passage, round McNab's Island and back.
2. June 22—Opening matches for Challenge Cups.
3. July 1—Corinthian matches.
4. July 11—Harbor cruising under orders.
5. July 18—Cruise to outports.
6. August 1—Race for Prince of Wales' Cup.
7. August 3—Annual dinner.
8. August 15—Harbor cruise.
9. August 22—Race for Governor General's medals.
10. September 5—Harbor cruise.
11. September 12—Harbor cruise.
12. September 26—Corinthian match, Flag Officer's prize.
13. October 3—Harbor cruise.
14. October 10—Harb r cruise.
15. October 21—Closing matches for Challenge Cups.

GEORGE M. GREER, Secretary.

Club House, 29th May, 1874.

The yacht Marcia, Capt. Warder, arrived at Halifax, N. S., last Thursday, 28 days from Gibraltar. She belongs to the Royal Yacht squadron. The Earl of Charleville is a passenger. She will proceed on a cruise to the Gulf of St. Lawrence.

A special meeting of the Dorchester Club has been called for Friday evening, June 19th, at the request of the owners of the Volante, Gleaner and Bristol, to take action on a motion to abolish the rule forbidding shifting ballast. The motion was carried at the last regular meeting of the club, but must receive a two-thirds vote at the next meeting before going into effect. The question of shifting ballast has long been a bone of contention in the club. The second of the championship regattas is to take place June 20th, at 2.30 P. M., at Commercial Point.

The Arlington is the name of a new club just organ-

ized near Boston. It sailed its first regatta on May 30th, six yachts competing. The prize flag was won by the Clara, Capt. Peabody, in 38 minutes 20 seconds. Distance, three miles. The Arlington is a promising and energetic club.

The C. B. Sloop Yacht Era, which has been laid up in Pierce Bros. Yard, at So. Boston, since last season, has been purchased by Commodore W. H. Baugs, of the Dorchester Yacht Club, of Jos. A. Jasagi, Esq., who is going to Europe. She is to be ready for the Dorchester regatta next Saturday.

Gen. Butler's yacht America got aground at low water on Ram's Horn Spit, Beverly harbor, last week, but was got off on the following day by a steam tug without serious injury.

The Atalanta rowing club have recently moved into their new boat house on the Harlem River. It is built upon a scow of 160 tons burthen, and is two stories high. The upper one is handsomely furnished, and contains, among other things, a piano for the use of the members of the club. The lower floor is fitted up as a boat house, and is perfectly arranged for the varied collection of boats of all kinds and sizes. Having a floating foundation, it can, of course, be towed to any water front should a change of locality ever become desirable. The Atalanta club was organized in 1848, and has at present eighty-four active and forty honorary members. The following is a list of the officers of the club:—President, Ransom Parker, Jr.; Vice President, William H. Webster; Recording Secretary, J. W. Edwards; Financial Secretary, William H. Manirand; Treasurer, W. H. Sproull; Captain, George Spingsteen; Lieutenant, George Rohr.

The following boating crews entered for the regatta of the Schuylkill Navy, open to all amateurs, which began yesterday and is continued to-day at Philadelphia:—

Four-oared Shells.—Pennsylvania, Philadelphia; Atalanta, New York; Quaker City, Philadelphia; Vesper, Philadelphia; Friendship, New York; Crescent, Philadelphia; Argonauta, Bergen Point, New Jersey.

Pair-oared Shells.—Nassau, New York; Undine, Philadelphia; Atalanta, New York; Philadelphia, Philadelphia; Vesper, Philadelphia; Gramercy, New York; Friendship, New York.

Double Scull Shells.—Crescent, Philadelphia; Nassau, New York; Argonauta, Bergen Point, New Jersey.

Single Shells.—Pennsylvania, Philadelphia; Nassau, New York; Argonauta, Bergen Point, New Jersey; Harlem, New York; Bachelor, Philadelphia; Quaker City, Philadelphia.

The Dartmouth college boat crew are at Enfield, New Hampshire, for a ten days' training on Mascoma Lake. They have the same boat used in the race at Springfield last year—a Spanish cedar shell, fifty feet long, twenty inches wide, 150 pounds weight, built by Elliott, Brooklyn, New York. He is building a new one for them to use in the race at Saratoga, which is to be similar to this in most respects. This year's crew is as follows:—

Name.	State.	Pos'n.	Age.	H'ght.	Wgt.	Class.
Charles O. Gates.	Maine.	stroke.	21	6 ft. 1	174	1874.
F. W. Mitchell.	N. H.	No. 5.	22	6 ft. 1	174	1875.
Charles W. Eager.	N. H.	No. 4.	19	6 ft. 1	165	1877.
B. F. Robinson.	N. H.	No. 3.	22	6 ft. 1	145	1877.
W. F. Westgate.	N. H.	No. 2.	22	5 ft. 11	166	1875.
W. G. Eaton.	Mass.	bow.	20	5 ft. 11	155	1875.

The captain of the crew, Gates, is the only one that rowed in the Dartmouth crew last year.—*Boston Journal*.

The stakes have been deposited for the great boat race between Scharff and Ten Eyck, which is to come off at Peekskill, on the Hudson river, next Wednesday, the 24th inst. The race is for the championship of the United States and \$1,000. Com. Benj. F. Brady is the referee. Scharff is matched to row George Brown, the champion of the British Provinces, for \$2,000 in gold a side and the championship of Canada and the United States, at Springfield on July 8.

In the rowing match on Monday on the Raritan river, at New Brunswick, between the Raritan Boat Club and the Rutgers College Rowing Association, Raritan won in 17.38; Rutgers, 21.01½. Course, two miles. Messrs. Neilson and Griswold represented the former, and Messrs. Warren and Janeway the latter.

The Patapsco navy review on the waters of the Patapsco last Friday, was a decided success.

The annual opening regatta on the Potomac Boat Club will take place on Thursday afternoon, the 25th inst., at 3.30 o'clock. There are six races down on the programme.

The Brooklyn Yacht Club held its annual regatta on Tuesday. The following were the courses and entries:—

SCHOONERS.

(Around the Lightship and return—forty miles).

Name.	Owner.	Club.
Tidal Wave.	William Voorhis.	Brooklyn.
Fleur de Lis.	J. S. Dickerson.	Brooklyn.
Meta.	G. A. Beling.	Brooklyn.
Comet.	William Langley.	Brooklyn.
Eva.	E. Burd Grubb.	New York Yacht Club.
Cornelia.	Dr. J. H. Vondy.	New York Yacht Club.
Gypsy.	H. Livingston.	Brooklyn.

FIRST-CLASS SLOOPS.

(Same course as schooners).

Undine.	Fowler & Brasher.	Brooklyn.
Kate.	Robert Dillon.	Brooklyn.
T. B. Astor.	Platt & Allen.	Brooklyn.

SECOND CLASS SLOOPS.

(To Gedney's Channel Buoy and return—Thirty-two miles).

Joe Jefferson.	J. Varian.	Manhattan.
Qui Vive.	S. Clapham.	Brooklyn.
Dudley.	E. Williams.	Brooklyn.
Schemer.	C. H. Hall.	Brooklyn.
Genio.	G. Haight.	Brooklyn.
Elizabeth.	T. Turner.	S. Y. C.
Flying Cloud.	W. P. Smull.	Brooklyn.
Kaiser Wilhelm.	Norris & Greenleaf.	Brooklyn.
Linda.	John W. Stout.	Brooklyn.
Seline.	H. S. Wood.	Brooklyn.
Nimble.	John N. Dimon.	Brooklyn.
Emelye.	J. C. Crawford.	New Jersey.
Mary.	P. H. Hill.	Jersey City.
Emma T.	J. Treadwell.	Brooklyn.

THIRD-CLASS SCHOONERS.

(To Southwest Spit and return—twenty-four miles).

William T. Lee.	C. A. Cheever.	Brooklyn.
Eclipse.		Union.
Brooklyn.	Ira Smith.	Long Island.
Bismarck.		Long Island.

The first class boats got away at 11:16:30, the second class started at 11:21, and the third class at 11:23:45. There was a stiff southeast wind. The following were the winning vessels:—

Schooners—Tidal Wave, winning the flag, officers, and club prizes, beating the Comet 2 min. 50 sec. The Comet won the Union prize.

In the first class sloops the Undine won the first prize, beating the J. B. Astor 22 min. 55 sec., the latter taking the Union prize.

In the second class sloops the Schemer won the first prize, beating the Kaiser 4 min. 56 sec., the latter taking the Union prize.

In the third class sloops the Wm. T. Lee won, coming in 44 seconds ahead of the Brooklyn.

Yesterday, 17th, the fleet started on its annual cruise.

CINCINNATI, June, 1874.

EDITOR FOREST AND STREAM:—

On Saturday last (June 6) the long looked for boat race came off. The day was excessively hot, the thermometer standing at 90 deg. in the shade. The two contestants, Fred. Wolff and John Tucker, were ready at the proper time. The course was from Schmidt's Boat-house to a point 1½ miles up the river and return, making in all three miles. Wolff came in about two lengths ahead of Tucker in 27 minutes. Wolff was much elated at his own time, and immediately issued a challenge to any one who would row him for a purse of from \$50 to \$100, over the same course. John Barbour has accepted it, and the match is to come off within four weeks after the signing of the articles. Tucker also issues a challenge to Charles Weeks for a purse of \$200. It has not, as yet, been accepted.

The Cincinnati Boating Club is getting along swimmingly. Their new four-oared paper shell has just arrived.

W. L.

New Publications.

The *Maritime Monthly Review* for June. Saint John, N. B.

We have been in receipt for some time of the numbers of this excellent Review, and before this should have given it the notice it so fully deserves. Conducted under the auspices of an association of gentlemen, and edited by H. L. Spencer, Esq., the *Maritime Monthly Review* is not only most intelligently written, but is especially interesting, as it contains a special literature both novel and fresh in character, descriptive of the locality from whence the Magazine emanates. If the extreme limit of Western America should find expression in the "Overland" from the Pacific Ocean, we are only too glad to have a balance from the uttermost Atlantic side in the *Maritime Monthly*. Among a variety of excellent matter we note "The Chronicles of Punch Bowl," in which the fortunes of a hardy fisherman, Job Cobbiduck, are told with a great deal of humor and force, and how Mrs. Hurlbut, the parson's wife, tried to reform his hard ways, but how a school of herrings tempted him, and finally how he came to grace through the medium of a big cuttlefish, and was taught to sin no more in breaking the Sabbath. Such descriptions, purely local, are admirable in character and give a cachet of originality to the *Maritime Monthly* which makes it most welcome. Already in its third volume, this Magazine seems as if its career would be a lasting one, and it is a most interesting feature of the good taste and literary ability of our friends in the good province of New Brunswick. We notice among its corps of contributors Mr. J. N. Wilson, a frequent writer for FOREST AND STREAM.

THE FRONTIER SERIES. Illustrated. A THOUSAND MILES WALK. Nathaniel H. Bishop. Third edition. Lee & Shepard: Boston and New York. *1873.

This is a most pleasantly fresh and ingenious description of a long journey taken on foot some years ago by a brave American lad, who tramped it away across the Pampas, from Buenos Ayres on the Atlantic side, over the Andes to the coast of Chili. One great charm of the book is its truthfulness. Descriptions of life as seen by the narrator when in company with the gauchos are novel, and we believe have been rarely written up before, save by hearsay. The pluck of Mr. Bishop, his endurance, must have been immense, as it is almost certain that his life must have been endangered more than once. In reading it one is struck with the sad and worthless characters of the men who inhabit the central plains of South America, and how their lives present pictures of greed, superstition, cruelty and depravity. Mr. Bishop's narrative, written some seventeen years ago, is still as fresh as if produced only yesterday. For manners and customs must never change in Central America, and civilization makes no further progress there than in Central Asia. That the book is appreciated is evident from its being now in its third edition. "A Thousand Miles Walk" contains many interesting accounts of the birds and animals of the Pampas, and we know that the early taste shown by the author when yet but a lad for natural history, has been further developed. Dr. Brewer, our well known naturalists speaks of Mr. Bishop as "a young and enthusiastic naturalist, whose zeal in the study of natural history prompted him alone, unaided, and at the risk of his life, to explore the arid plains of South America while yet a mere stripling in years and stature, though his observations there exhibit the close and careful study of maturer years." The *Bostrom gringo* and his book are exemplifications of Young America's pluck, courage and study.

LORD OF HIMSELF. A Novel. By Francis H. Underwood. 515 pp., 12mo. cloth. \$1.75. Boston: Lee & Shepard.

This is a novel possessing all the requisites to ensure it an enduring popularity and extensive sale. It is truly an American story, and presents a kaleidoscopic picture of society at the South thirty years ago. Old Kentucky will be presented to the reader in a new and very interesting net work of characters as they existed, acted and thought in those days. Full of true historical facts, this tale is like the sun pictures of the daguerreotype, abounding in scenes of the most absorbing interest to every one. Mr. Underwood, in this sketch of the Kentucky "blue blood," a true gentleman in every and all places, and always the truly hospitable, large-hearted man, has only repeated an historical well known fact. As in novels generally, our hero, Beauchamp Russell, after much tribulation, becomes acquainted with Miss Adelaide Staelburne, an heiress and a lovely girl, and of course was soon deeply in love with her. Upon the many after events and complications of the work all comes well in the end, and our cordial approval of this work is given unreservedly in its favor. It is, in a word, a work of great ability and rare excellence, and in a literary point of view we rank it as A No. 1 among American novels.

GOOD LUCK. By Francis A. Shaw. From the German of "Gluck Auf." Boston: James R. Osgood & Co.

In this work are clearly brought out many of the strong points of German character; the life of the peasantry is well sketched, and though the author develops much of the fierceness of conflicting ebullitions of deep feeling, we find he has done only simple justice to the subject he has chosen for illustration. A man of a ruthless, boorish, coarse nature, although revelling in wealth, is quite willing to sacrifice to a chimera of family pride a young and beautiful daughter to one, even in his circumstances, unfitted for her. Every one will be in love with the heroine, while they will derive some new idea of German customs and of the German character, as unfolded in the pages of this very readable romance.

RELATION OF INSECTS TO MAN. By A. S. Packard, Jr., Editor of the *American Naturalist*, &c., being No. 3 of the popular series published by Estes & Lauriat. Boston.

This work relates to the habits, &c., of many familiar and well known insects, but is treated in such manner by the author that we often believe we are reading about a new order of insects, and it is not until we place this old fellow under a microscope that we see the same old face—(see fig. 54.) This is one of the best numbers issued. Among the numerous insects named, the "Trap-door Spider" is finely illustrated, together with an account of some of the poisonous spiders of warm latitudes. While we believe with our author that "all the animal creation is a part, piece and parcel of the Divine plan," we do not agree with other philosophers and some theologians, who even ascribe immortality to the animals, and believe that in the hereafter we shall hear the song of the mosquito and the hum of the bee and the shrill, rolling drum beat of the cicada. In this latter assertion we believe there is more of the "lunar" than we care to believe in. These "half hours with insects" are well worth thrice the price asked for them. All our youth should subscribe for them, as they are among the few good books upon every day life they can not well do without.

PRIZE LIST.

FOREST AND STREAM
A Weekly Journal,
DEVOTED TO
Out-Door Sports

Hunting, Fishing, Yachting, Boating, Practical Natural History, Fish Culture, &c. &c.
It is the OFFICIAL ORGAN of the

FISH CULTURISTS' ASSOCIATION
OF AMERICA.

The Publishers of FOREST AND STREAM
In order to stimulate the development of

MANLY and ATHLETIC EXERCISES,
AS OF
FISHING, SHOOTING, ARCHERY, CRICKET,
FOOTBALL, and CROQUET.

FOOTBALL.

For \$17 00, three copies, one year, with one Rugby football; price \$6 00.

FISHING RODS.

For \$15 00, three copies, one year, with one superior four joint light rod, suitable for all kinds of fishing; price \$7 00.

For \$60 00, twelve copies, one elegant rod; suitable for trout, black bass with fly, or for trolling bass or pickerel; as fine a rod as can be made; German silver tipped, with three tips; price \$25 00.

CROQUET.

For \$20 00, four copies, one year, with very handsome set of croquet; price \$7 00.

For \$25 00, five copies, one year, with superb set of croquet; price \$10 00.

For \$30 00, six copies, one year, with the finest set of croquet made; price \$14 00.

REMINGTON RIFLE AND SHOT GUN.

For \$75 00, fifteen copies, one year, with one Remington Deer rifle; price \$28 00.

For \$100, twenty copies, one year, with one Target rifle, 30-inch octagonal barrel, to be used for sporting, hunting, or target shooting; price \$36 00.

For \$100, twenty copies, one year, with one Remington double barreled, breech-loading shot-gun, one of the best guns ever offered to American sportsmen; price \$45 00.

SHARPE RIFLE.

For \$107, twenty copies, one year, with one Sharpe sporting or target rifle, best quality; price \$40 00.

WARD-BURTON RIFLE.

For \$300, forty copies, one year, with one Ward-Burton rifle magazine gun for large game, price \$0 00.

SINGLE AND DOUBLE BARREL MUZZLE LOADING SHOT GUNS.

For \$20 00, four copies, one year, with one American single barrel gun, perfectly safe, blue barrels, walnut; price \$10 00.

For \$35 00, seven copies, one year, with one American double gun, handy and reliable gun every way; price \$18 00.

For \$50 00, ten copies, one year, with one double boys' fine twist barrel gun, a safe gun every way for boys; price \$26 00.

For \$75 00, fifteen copies, one year, with double gun, English laminated steel barrels, handsome finish; price \$35 00.

CASH PREMIUMS.

To those who prefer cash premiums a discount of 25 per cent. will be made on all clubs of three and upwards.

Every article is of the finest quality and will be sent free of expense.

Remitting Money.—Checks on New York City banks and bankers are best for large sums; make payable to the order of FOREST AND STREAM PUBLISHING COMPANY, 103 FULTON STREET, NEW YORK. Post Office Money Orders for \$50 or less are cheap and safe also. When these are not obtainable, register letters, affixing stamps for postage and registry; put in the money and seal the letter in the presence of the postmaster, and take his receipt for it.

Send the names with the money as fast as obtained, that subscribers may get the paper at once.

Miscellaneous.

Orange Sporting Powder.

ORANGE LIGHTNING POWDER,
The strongest and cleanest Powder made. Nos. 1 to 7, packed only in sealed 1 lb. canisters. The coarser sizes especially are recommended to owners of fine breech-loading guns, giving great penetration with very slight recoil.

ORANGE DUCKING POWDER,
For water fowl. Very strong and clean. Nos. 1 to 5. Packed in metal kegs of 64 lbs. each, and in canisters of 1 and 5 lbs.

AUDUBON POWDER,
Very quick. For woodcock and quail Nos. 1 to 4. Packed in metal kegs of 124 lbs. and 64 lbs., and in pound canisters.

ORANGE RIFLE POWDER,
The best for rifles and for all ordinary purposes. Sizes F.G., F.F.G., the last being the finest and most used. Packed in wood and metal kegs of 25 lbs., 124 lbs., and 64 lbs., and in canisters of 1 lb. and 1/2 pound.

All of the above give high velocities and less residuum than any other brands made.

Ask your Dealer, or send direct to our works for a supply of PURE Tobacco.

VIENNA, AUSTRIA, Nov. 30, 1873.
Messrs. Wm. S. Kimball & Co.:
Sirs—A friend of mine sent me, with a transport of Indian Skulls, two pounds "Vanity Fair," which I declare to be the best Tobacco I ever smoked. We have very good tobacco in Vienna—Turkish and Hungarian, but "Vanity Fair" is the King of all, by its aromatic flavor and the right sort of strength. My friend in New York got an appointment in California, by that reason I apply immediately to you, begging you to send me for the enclosed ten dollars, a supply of "Vanity Fair," and send with the next steamer to Germany. If there is a German firm that sells your excellent "Vanity Fair," I beg you to enclose me the address.

REMINGTON'S CHALLENGE

Long Range, Breech Loading.

TARGET RIFLE.

Weight, 10 lbs.
Length of barrel, 34 inches.
Calibre, 44-100 in.

Pistol-grip Stock, Fine Walnut,
Oil Finished, Checked Grip, Case-
hardened mounting.

The following discs for front sights.

Open bead Bar and Slit. Bar & Open Bead.

FRONT SIGHT.

At the "Long Range Match" of the "Amateur Rifle Club" on the 30th ult. 6 REMINGTON and 12 other rifles were entered. The score which we append below shows that the REMINGTON still maintains its superiority:

800 yards,	Average for Remington,	15	Average for others,	8 2-3
900 yards,	do. do.	11 2-3	do. do.	5 11-12
1,000 yards,	do. do.	9 5-16	do. do.	8 1-2
	Total average,	12	Total average,	8

Net gain of REMINGTON over all others, 50 PERCENT. At the 1,000 yard range only the eight highest in previous ranges were allowed to enter, which though admitting all the Remingtons, admitted only two of the others. This fact will account for the approximate average at 1,000 yards. The two best marksmen on each side scored 30 with Remington's to 17 with the others. "Blood will tell." See this paper, of June 4th, for official record of the above. For full particulars of these rifles address

STILL AHEAD! IF YOU WOULD WIN, SHOOT THE REMINGTON.

At the long range match on the 13th instant for the Diamond Badge, Remington rifles won the first, second and third prizes.

The scores at which 14 Remington and 19 other rifles were entered, were as follows:—

Average at 500, 800, and 1,000 yards for Remington,.....624
Average at 500, 800, and 1,000 yards for others.....51

Twenty-two and a half per cent. gain for Remington. "A word to the wise," &c.

E. REMINGTON & SONS, 281 and 283 Broadway, N. Y.,

OR ARMORY, ILION, N. Y.

This arm was submitted in competition with over one hundred different systems, American and European, to the Board of United States Officers, appointed by Act of Congress, 6th June, 1872, for the purpose of selecting the best arm for the service, and of which Brig. Gen. A. H. Terry was President. It successfully passed through all the tests.

The following is the report of the Board:
"Resolved, That the adoption of magazine guns for the military service by all nations is only a question of time; that whenever an arm shall be devised which shall be as effective as a single breech-loader, and shall at the same time possess a safe and easily manipulated magazine, every consideration of public policy will require its adoption."

Resolved, further, That the experiments before the Board with the Ward-Burton Magazine System have so impressed the Board with the merits of this gun, that they consider it as more nearly fulfilling the conditions above specified than any other tried by them or of which they have any knowledge, and it does recommend that a number of magazine muskets be made on the plan for further trial in the field." (See Ordnance Report.)

We are now receiving orders for these guns, and due notice will be given in this paper when they are ready for delivery.

The following is our scale of prices: Special Magazine for large game, carrying from 3 to 8 cartridges, 70 to 85 grs. of powder, 350 to 400 grs. of lead, 8 to 10 lbs. weight, from \$60 and upwards, according to finish. Special Long-range Magazine Rifle for Creedmoor shooting, 90 grs. of powder, 480 grs. of lead, carrying 3 to 8 cartridges, weighing 10 lbs., from \$100 and upward. Magazine guns for general use, carrying 3 to 9 cartridges, 60 grs. powder, 350 grs. lead, from \$40 and upward. Single Breech-Loader, Creedmoor shooting, for long range, 90 grs. powder; 480 grs. lead, from \$60 and upward. Single Breech-Loader for general use, 6 to 7 lbs., 60 grs. powder, 350 grs. lead, from \$30 and upward. The calibre of all our rifles, unless otherwise ordered, will be 45-100 in.

YACHT SONG.

THE wind is fair, and glittering stars
Are twinkling clear and bright,
The worlds above like countless gems,
Adorn the glorious night.

Hurrah! hurrah! we know not care,
The ocean is our home;
Then merry, merry let us be,
While o'er its depths we roam.

Our little bark rides gallantly—
Ha! mark the swelling sail,

The billows roll and softly sigh,
While sweetly sings the gale.

Hurrah! hurrah! we know not care,
The ocean is our home;
Then merry, merry let us be,
While o'er its depths we roam.

How pleasantly we glide away,
The shores are lost from view;
We swiftly float o'er sparkling sea—
Adieu! kind friends, adieu!

Hurrah! hurrah! we know not care,
The ocean is our home;
Then merry, merry let us be,
While o'er its depths we roam.

St. John, N. B.

J. NEWTON WILSON.

Fourteen Days in the Bush.

QUEBEC TO LAKE ST. JOHN AND THE SAGUENAY.

CAPTAIN DAVENPORT, late of her Majesty's service, and wife, who settled in Quebec some years past, performed the remarkable journey at the time from Quebec to Lake St. Johns overland. Lake St. Johns is the headwaters of the Saguenay River, so well known now to all American tourists. The lake is distant one hundred and twenty miles from Quebec, through a wild, untravelled, wooded and mountainous country, and the hardships the party endured can easily be credited by those who have ever travelled the Canadian wilds, where one mile is more than five under ordinary circumstances. Mrs. Davenport's is the history of the first woman who ever performed the journey, and reflects much credit upon her courage and determination. Mrs. D. is a lithe, active little lady, and possessed of no ordinary love for adventure. The trip was undertaken solely for pleasure and the novelty of roughing it in the bush. I am indebted to her for the particulars of their journey.

On August 21st, 1871, they started from their residence near Spenceer Wood, accompanied by the men and horses engaged for the journey. At Stoneham, eighteen miles from Quebec, on the Jacques Cartier River, they met their Indian guides, and early on the following morning commenced their adventurous undertaking. During the afternoon the rain poured in torrents, thoroughly drenching them before they reached a small shanty further up the river, in which they took shelter. It was a serious question how to dispose of so large a party in such limited quarters, but was finally arranged by Mrs. D. and husband, with her mare Katy, occupying one half, and the three men and the other three horses the remainder. It was pretty close packing, and they were in much danger of being tramped upon by the horses, and what with the wet clothes and hard boards they obtained but very little sleep.

The next day, the difficulties of the road becoming greater, Honoré, the Indian, was dispatched back to procure two more Indians, while they slowly continued on. Mrs. Davenport here says "my horse carried the two buffalo robes, horse rugs, and blankets, and I perched on top, sticking on as well as I could, though the overhanging brush often threatened to sweep me off. The path in many places was through deep and treacherous swamps, in which the horses sank oft times to their bellies."

That night they reached a camp where some men were at work, who seemed to be very much surprised to see

such a party as our travellers, and being French Canadians they had some difficulty in understanding that they intended remaining there for the night. About half past ten Honoré arrived with the two other Indians, whose services he had procured. The boss of the shanty on the following morning offered to take them up the river and across the Jacques Cartier Lake. With some difficulty, they got all the luggage into the boat. The river was very deep, and many large fish and water fowl were seen. For some two miles all went well, until a long reach of rapids compelled them to disembark while the men hauled their boat through—no easy matter. Mrs. D., unaccustomed to such rough walking, was constantly falling into holes, or getting fast in the swamp. The flies bit without mercy, and the sun was broiling. In crossing the lake they encountered a very severe hail and snow storm, and having no heavy coats or covering available, suffered much from the cold, while their frail craft was in momentary danger of capsizing. About six P. M. they reached the end of the lake, and there found the men who had arrived with the horses. They described the journey with the animals as a fearful one. They were obliged to make three bridges, and once to swim the horses across the river. Mrs. D. and her husband fished the lake that night, and took some very large trout.

They continued their journey next day, using the horses as much as was possible where so many windfalls were occurring. Once in recrossing a river Mrs. D. fell in, but the water not being very deep she was rescued with only a ducking and a fright. While waiting here for the remainder of the party to come up, some of them got out their fishing tackle, and the number of trout taken was extraordinary. Where the water was shallow they could see the fish in a dark mass on the bottom. They camped in a dense wood near the water, and were almost devoured by the flies. The roar of the falls two miles below was plainly audible.

They continued down this river—the Chicoutami—in the boat, though they were compelled to make many portages. Once the Indians proved refractory, and refused to go further, but Mrs. Davenport's firmness, and the declaration that she would continue on alone, reduced them to submission. They were all very much disfigured from the fly bites. Mrs. Davenport's head and neck were so swollen that she was compelled at night to remain in a sitting position. Her clothes were in rags, and her shoes entirely given out. Honoré lent her a pair of moccasins, and her husband wrapped her feet in handkerchiefs to prevent the stones from hurting them.

The ninth day commenced with rain, and continued throughout the day. Birch bark being plentiful, a cabin was constructed for Mrs. Davenport, who had now quite lost the use of her limbs, and could not stir. Provisions were fast giving out, and though actual starvation did not stare them in the face it behooved them to waste no time in reaching their journey's end.

All were up at daybreak, anxiously looking for the Indians to come up with the scant remainder of the provisions. They waited until noon, and not hearing anything of them, they continued on, and camped at night on the bare ground, the rain pouring in torrents. Supperless, they composed themselves to take what rest they could. Next day (the eleventh) they reached a little lake, which Mrs. Davenport describes as very lovely, covered with a profusion of white and yellow water-lilies. There seemed to be plenty of fish in it, but they were without the means of taking any. Captain Davenport shot three partridges, but being the spruce partridge, were not very palatable.

The thirteenth day they reached Johnson, the other two Indians and the horses. They were standing on the river bank, and Mrs. Davenport says so wretched and emaciated were the appearance of the men and horses that she did not at first recognize them. They had suffered most severely in crossing the many swamps, and more than once came near losing the horses. On reaching the river Johnson had dispatched one of the Indians to procure assist-

ance from the lake, and they were camped here awaiting his return. The condition of our other party was not much better than Johnson's. Mrs. Davenport was so prostrated that on the arrival of the expected help from the lake they were compelled to construct an ambulance, upon which she was carried by two men. The journey now was fast approaching its close, and late next evening they had the happiness of reaching some civilization, and in Mr. Tremblay's house they found a cordial welcome from his wife, and under her care in a few days they had recovered sufficiently from the effects of their trip to visit some of the points of interest around the lake. The Indian encampments, the Hudson's Bay Post each in turn received a visit.

Mr. Tremblay, their host, informed them that they were the third party he had rescued from starvation attempting to reach the lake overland, and he himself the winter previously had a narrow escape with a party of eight whom he was conducting to the lake.

Mrs. Davenport describes the lake as more of a sea than a lake in extent, and its shores on the opposite side appearing like a mere silver line.

A few days later and they were driven to Ha Ha Bay on the Saguenay, from whence they took steamer to Quebec, and arrived without further event.

G. M. FAIRCHILD, JR.

For Forest and Stream.
THE IRISH HUNTING SEASON.

*Solvitur aeris hiems, grata vice veris et favoni,
Diffugere nives; redeunt jam gramina campis,
Arboribusque comæ.*

THOUGH the above lines, if taken literally, would hardly apply to the unusually mild season that has just passed away, it is no less true that winter—such as it has been—has come and gone, without our ever having been well aware of its presence, and that we are now enjoying the beauties of a spring, which thus far, promises to be all that the vernal season should. The transition, however, has been so imperceptible, so gradual, that I doubt whether we appreciate the "grateful change" the poet speaks of as fully as we should have done, had it followed on the heels of a severe and boisterous winter. We are apt to associate the latter with snow and frost, with slush and mud, and in this moist Irish climate of ours, with many a dreary day of incessant steady rain, direful forebodings of frost-bitten noses, and chapped hands and feet, of coughs and colds, and doctor's bills, are connected with our thoughts of it; gloomy visions of the thermometer at zero, and coals at forty shillings a ton, present themselves before us, and while there are many who actually dread the approach of the short November days that usher in the close of the dying year, there are few persons disposed to look upon the advent of one of our normal English winters altogether in the light of an unmixed blessing.

There is one class of men, however, who have every reason to be pleased with their experiences of the past six months. Never before perhaps has hunting had so few interruptions, or less difficulties to contend with. While snow has been wholly unknown, frost has been so slight as not once to interfere with the scent, and of rain there has been barely enough to soften the ground sufficiently to render riding both pleasant and safe. In this county, where we can reckon on at least three "meets" a week, there has been but one day on which the hounds were not "thrown off," and from other parts of the country the reports have been equally favorable. The season of 1873-4 will long be remembered for its unprecedented brilliancy, and is worthy of being chronicled in golden letters in the hunting annals of the past. While we are on the subject, I might remark on the singular fascination that hunting possesses for its followers. The five or six months it calls its own they devote themselves to it with an energy and persistency which the majority of them would be quite incapable of applying to any other subject. From the opening to the wind up of the season they live in a fever of excitement, their minds alternately swayed by hope and fear, and their spirits mounting and sinking with every corresponding rise and fall of the weather-glass they so frequently study. Their thoughts flow but in one channel, and the *ultima thule* of their ambition consists in their not missing a single "run," and in their being "in" at every "death." From the first to the final meet they grudge poor "puss" or "reynard" a day's respite, and deep are their imprecations should the clerk of the weather in a capricious moment send a dash of frost, or a few nights heavy rain, to mar their sport. The

first question with which they accost the servant who brings up their shaving water in the morning, is touching the prospects of the day, and should there be nothing cheering to communicate, the domestic had better answer warily, for if his information be not in accordance with his master's wish, it is ten to one on the latter's dismissing him with a voluble malediction, and the discharge of a boot, or the first object he can lay his hand on, after his retreating figure. Nothing seems to damp the ardor of these Nimrods of the Chase. They will ride for hours with the rain beating pitilessly upon them—their scarlet coats and glossy hats soaked and dripping with wet, imparting to the wearers a woe-begone dragged appearance—content to follow so long as the hounds can find, and there is a chance of its clearing up, and only reluctantly turning homewards when at last in despair the huntsman draws his pack off. Should they come to grief, and get an ugly spill-to-day, the mishap, instead of slackening, adds fresh fuel to their zeal, and provided no bones are broken, they are ready to risk their own necks and those of their horses with the same fearlessness as ever on the morrow.

Foreigners are often struck at the zest with which Englishmen enter into all their out-door sports, but in none is the enthusiasm so widespread, in none does it reach so high a pitch as in hunting. The causes for this enthusiasm, were it confined to the few that hunt, it would be easy to assign, but when we find it shared by the far larger proportion who take no active part in the sport, it is, at first sight, rather difficult to account for. In the case of the first-mentioned class of persons, the reasons are obvious. The ride to cover—the meet—the momentary delay while the hounds are being thrown off—the chorus of short, quick yelps, the sweetest music to a fox-hunter's ear, that proclaims Master Reynard is "at home"—the "break"—the sharp "spin" that follows as an old dog-fox takes to the open—and the "check," when for a time both hounds and men are at fault, and the chances of a "kill" grow smaller and smaller—these are a few of the attractions that hunting holds out to its votaries, and yet they are only the preliminaries, which dwindle into nothingness, when contrasted with the closing and far more exciting scenes of a fox-hunt. Presently some staunch old hound, keen of nose, and clever in picking up the scent which lost, "gives tongue," the huntsman's horn rings out, summoning the scattered pack, who quickly confirm with loud and joyous voice the welcome discovery. And now ensues that wild, mad burst 'cross the country, when the fox, baffled in all his attempts to get to "ground," and resolved to die game, leads the way at a break-neck pace, that quickly thins the field. Away they go, the hounds in "full cry," closely followed by the huntsman and some half dozen fearless riders, who, reckless with excitement, and confident alike of their horses' mettle and capabilities, dash heedlessly forward. Fences are boldly taken, hedgebanks cleverly topped, and stone-walls flanked by ugly ditches bravely cleared, a horse and rider, impelled by a common sympathy, strain every muscle to gain the foremost place. On, on, they hold, sweeping with the rapidity of lightning across smooth green meadows, and through deep-ploughed fields, breasting steep inclines, covered with heath and rock, and dashing down sloping hill-sides, bright with the yellow gorse just bursting into bloom. Little time is there, however, to admire the natural beauties of the picture, as with hands low, seats firm and close, the horsemen with difficulty restrain their fiery hunters, and seldom have occasion to use either whip or spur to press them forward, or to urge them to further exertion. Such furious going neither man nor beast can stand for any length of time; both begin to show signs of failing, and could the fox hold out for a few brief minutes he might yet escape. But while the pace has told heavily on the pursuers, it has been fatal to the pursued. Right gallantly he has fought for his life, but his cunning and fleetness of foot no longer avail him, and in vain he strives to shake off his cruel foes. Steadily and swiftly the hounds gain on his flagging footsteps—but a ditch separates them, and that is quickly passed—a few yards more and they are close upon him. Their cries ring horribly in his affrighted ears, and already he can feel their hot breath streaming upon his flanks. Maddened at the awful sounds, and fired with the energy of despair, he again springs forward with a portion of his old vigor—one last desperate struggle—a few convulsive bounds—and all is over; as gamely as he lived he dies, and not a cry escapes to tell his agony. What wonder then that men ride hard, regardless of life or limb, to be up at such a death! What wonder that fox-hunting numbers so many ardent champions, when its lists engender such manly courage, awaken such blood-quickenings emotions, and offer such soul-stirring scenes to all who enter!

Having thus briefly pointed out the pleasures that exist for the followers of the hunt, the privileged few who lack neither leisure or means—the two primary essentials—let us glance at those which belong to the many—equally to the poor as to the rich—and which have served to render the sport so popular with our lower orders. From the earliest days of the Norman Conquest, the chase has been preëminently a national pastime. Poets have sung its praises in such thrilling language, and painters depicted its glories in such glowing colors, as not only have brought the subject vividly to every home, but have also sufficed to keep alive, and when necessary to rekindle the popular feeling in its favor. Moreover, while nearly all our other field sports have undergone changes so frequent and startling—the dictates of modern ingenuity and invention—as to retain little of their originality, hunting, from its very nature incapable of any great alterations, has come down to us with much of its ancient form and ceremony intact, and scarcely modified by the lapse of time. Though the pomp and splendor with which our Norman nobles conducted all the operations of the chase—from the long train of richly-dressed squires, gaily-caparisoned horses, and attendant serfs, that issued from under the massive portcullis of some feudal castle on a hunting morn in the olden time, to the lavish hospitality that marked the evening feast awaiting their return in the banquet-hall—have disappeared, there is still more show and more display connected with the hunt of the present day, than can be found in any other of our pastimes. In this fact lies the main-spring for that affection with which it is everywhere regarded by the country people, and this it is that in their estimation entitles it to take precedence of all others. The lot that debars the laborer or the ploughboy from sharing the dangers and fascinations of a "run," does not deny them the pleasure of witnessing the meet, or of being spectators of the opening scenes of the drama that so often ends fatally for the crafty "varmint" that robs their hen-roosts, and plays such havoc with their chickens. That the pleasure is not an imaginary

one the crowds that flock to some of our more noted meets bear witness to. This is truer perhaps of Ireland than England. John Bull partakes too much of his neighbor the canny Scotchman's thrift and prudence to waste his time in racing over the country to see a pack of fox-hounds; whilst Pat, too fond of any excuse wherewith he may salve his conscience, willingly leaves his work and starts off "just to have a sight of the quality." Pat, too, being of a more excitable temperament than the phlegmatic Englishman, enters largely into a sport where there is so much to attract the eye and warm the blood. For him the meet, with its well-groomed, neatly appointed horses—strong of limb and stout of chest—its ladies in the trimmest of habits and daintiest of hats—looking as if they meant business, and seldom belying their looks—its members, from the master downwards, resplendent in "pink," its carriages, with their fair occupants, (for Pat is a great admirer of female beauty,) and its handsome well-bred pack of hounds, makes up a picture which fascinates and absorbs his attention. Except to climb a tree, or gain some new point of vantage, whence he can command a wider and more extended view, he will not move till the hounds are out of sight and the last carriage has left the ground, and then he slowly, half-sorrowfully wends his way home to talk and dream over the bright vision that has passed before him. It is strange to observe the excitement that prevails in an Irish cottage when it is heard that the hunt is coming in their direction. From the commotion that ensues one might suppose the "Shah," or "Emperor of all the Russias," (a better "draw" just now,) was about to pass, instead of a score or so of ladies and gentlemen out for a day's amusement. The "boys" at work in the field throw down their spades and hasten off to mount the nearest ditch or stone-wall, over which the chase will lead; running as fast as her legs can carry her, and three or four ragged, bare-footed "childer" hanging on to her skirts will permit, the "ould woman" may be seen hurrying up, determined if possible to get a look at the "fine ladies and iligant gentlemen on horseback." She has probably left the potatoes for the dinner boiling on the turf fire, and by the time she gets back the pot will most likely be upset, and the pig hard at work on its contents, but such a contingency she neither dreams of, or if she does, it troubles her but little. No people are so fond of sport or so easily pleased as the Irish. It is well that it is so. The bright spots in their life are few and far between; it is fortunate if when a stray gleam of sunshine—though it be only in the form of a passing fox-hunt—comes to lighten up their existence, they lack neither the power nor the will to appreciate it accordingly.

LIEUT. W. HUTCHISON POE.

For Forest and Stream.

LANDING A NINE-POUNDER.

PERMIT me, with a pardonable degree of vanity, to give you an account of an exploit of mine last July in the Adirondacks. The Adirondacks! What a host of delightful associations the words conjure up. Oh! how fresh and pure the air! how charming the freedom enjoyed in those beautiful woods!

My party consisted of our matron, a young friend of hers, two guides and myself. How picturesque the ladies looked in their mountain costumes, with their luxuriant hair falling in rich profusion over their shoulders, and their jaunty hats shading their sun-browned faces, made browner still by the horrid tar they used to keep off the flies and punkies, until they fairly rivalled the dusky hue of the Indian maidens who laughed and danced under these same old trees in days of yore!

It was on the 3d of July, 1873, that I heard the call for breakfast, and slowly conning over our previously planned expedition I dressed myself hastily; i. e. put on my hat, and started for the stream near by to wash the cobwebs from my eyes. A sonse into the water over eyes, nose and ears, a shake of the head like a spaniel, throwing the fresh drops high in the air, completed my toilet. The sunlight was breaking through the fog, and coloring it with rosy light. A distant mountain peak with a listless fleecy cloud half way up, looked majestically upon our camp. Birds were striving for sovereignty in their songs in a right earnest way; conspicuous among which were the beautiful jays, that I recall with pleasure only as they serve to give life to my thoughts of the woods. The smoke rose perpendicularly like a tiny cloud from the camp fire, half hidden in the trees. The tents and camp kit carelessly strewn about, the bark table, with its picturesque covering to keep off the sun and rain; the odor of broiling venison and steaming coffee, added a charm and zest to the enjoyment, which, go where you will, can never be found out of the woods. Hastily devouring our breakfast, Marshall and George made a hurried good bye to the ladies; instructing them for the hundredth time at least, what to do when that much feared and thus far mythical panther should appear, a "wagging his tail behind him!" I picked up my rod and gun, pocketed a couple of biscuits and about a half pound of maple sugar, and joined the guides who were awaiting me somewhat impatiently by the bank of the stream. Our "carry" to the adjoining chain of ponds was accomplished without event, save the starting of a few grouse, and provoking the scrutiny of a few chipmunks, made tame by the very wildness of the place. We adjusted our table, caught our minnies, and then began our morning sport. The strictly orthodox sportsman must by no means classify us with the much maligned bait fishermen; for, know ye, that he whose exploit is about to be chronicled had only the day before, with the aid of his split bamboo and brown hackles, successfully landed two two-pound trout, both hooked at a single cast, one in the usual manner, and the other just forward the caudal fin, thereby giving him full power to circulate to his heart's content. We must confess, however, upon this particular occasion we were not so strictly orthodox as to forego our morning troll. A few small trout, none weighing more than three fourths of a pound, were our only trophies for the first hour. While thinking seriously of changing our pond, I felt a jerk on my line that sent the blood first to my heart and then through my tingling veins at a furious rate. "I guess you have got the father of all trout at last by the way he pulls," said George. "I feel him on the oars!" "Pull slowly Mr. —, give him plenty of time." A moment of quiet was followed by a series of jerks that one would suppose came from the strong arm of a man. A jump from the water next revealed the size of my game. Down again he shot, lashing the water as he disappeared. "Pull slow and steady," said Marshall, "I've been a guiding for twenty years and never saw the mate to that fish, though there are

some in here as big as him; but I never seen one caught, I hooked one once and he bit my gang in two like so much thread! If you land him it will go from one end of these woods to the other, yes! quicker than if you had shot a moose, for that's been done, but no such speckled trout has ever been landed in my time!" After about fifteen minutes fight with that fish, to fight which over again would I walk fifty miles, I successfully landed him in the stern of the boat amid the congratulations of my guides. "I wouldn't have had you lose that trout," exclaimed George, "for fifty dollars, nor missed seeing him for fifty more!" I fear the Divine command against pride and vain-glory was utterly ignored by me when I triumphantly marched into camp and placed my beauty at the feet of my "fair Dulcinea!"

He weighed *nine pounds and a quarter*; measured twenty-seven inches in length and seventeen inches around the waist! If my unscientific reader will excuse the use of a technical term, and was in every and all respects a perfect specimen of the "*Salmo fontinalis*."

Where did you say you caught him? Oh yes! I neglected to mention that specifically. If my inquiring friend will join me on a trip to the first of that chain of ponds flowing towards the St. Lawrence, in the very heart of the forest, away from the beaten path of the summer tourists who frighten the denizens of the forest with their opera glasses, striped pants, hat box, sun umbrella, and a brace of breech-loading shot guns—Well! about two hundred yards from the bank of the middle pond he will see the ruins of our camp, yes, ruins! Time passes on, and on; the past is left only as an association. . . . the camp ground, our sweet "Dreamland" only in memory, those made dear by our camp life scattered, and tender reminiscences all that cluster around the ruins of our forest home! The blue jay fearlessly perches upon our broken table, and cocks his head triumphantly; the little squirrel rustles among the dried twigs that formed our bed, the owl sits above it and winks and blinks and nightly hoots out his complaints to the moon. Looking closely to the left of our camp our friend will find a blazed tree upon which is somewhat elaborately painted: "Camp Nymphæ Odorata." Then follow the names of our party and guides, together with the casual announcement that the above party were the killers and eaters of no less than eleven deer, and approximately the sum of two hundred pounds of trout, in the space of eight weeks; much to the edification of the flesh and of no possible detriment to the spirit." Come with me to that tree and I will show you the way across the "Carry." SMILER.

For Forest and Stream.

SOMETHING NEW (?) ABOUT SPIDERS.

LAST summer upon returning from a six weeks angling tour in Canada, we found the ceiling and posts of a portico opening upon the flower garden, filled with spider webs. In nearly every web the spider was to be seen snugly ensconced in the least conspicuous place. Selecting the most perfect web, and the one containing the largest spider we spared it from the general destruction at once commenced by the servant. We have read many curious things about spiders, and hoped to be amused as well as instructed by carefully watching the habits of this one, which my little girl named Nero, from the rapacity and cruelty he exercised towards the many flies captured each day. One morning we noticed Nero running rapidly over the continuous thread which formed the filling, so to speak, of the warp made up of the various radii extending from the centre of the web. As the web was in perfect condition, needing no repairs, this unusual movement attracted our careful attention. After going several times around and gathering quite a little ball of the line he carefully crumpled it down his throat; this action was repeated until in a few moments all the filling and finally the radial lines were swallowed, with the exception of a few with the long guys attached.

Soon the sky darkened, and in a half hour the rain was pouring down and sweeping away all the webs in the vicinity of Nero's corner. In another half hour the sun was shining, and as soon as the water had dried up Nero was rapidly renewing his web.

Lest there should be any optical illusion or spiderly legerdemain, upon the following afternoon a newspaper was carefully placed under the web to catch anything that might fall. Nero was also carefully watched to see that he did not stow away his web upon the extension of his body. Surely enough the coiled up web all went down his throat at the approach of the next shower. Mrs. W— was called and without any leading questions at once described the spider as taking in and swallowing the web. The next opportunity that occurred the same test was applied to my little girl, who unhesitatingly cried out. "Why papa! Nero is swallowing all his web." Soon we discovered that long before we saw the faintest signs of the coming storm, the web had been carefully stowed away.

Making as accurate a description of the spider as possible my friend Dr. Schaeffer, the then librarian of the Patent Office, who was a man of marked attainments in natural history, at once determined the species, and turning to some standard work upon the Arachnidae showed me a very good likeness of my pet Nero. Dr. Schaeffer has since died leaving a place not easily filled among our workers on science and natural history, and as the work above cannot be found, the name of the species cannot be given. As nearly as can be remembered it was what is generally known as the common garden spider. After a careful search through whatever works and articles on the Arachnids I have at my command, I fail to find any mention of any such habit of the spider. Several naturalists of this city have also declared their entire ignorance of any such habits of any of the Arachnids. Inasmuch as three persons separately observed and reported the same in substance, it must be accepted as true. Other spiders with webs in less exposed places did not take them in, but there was no necessity for it as they were never much damaged by the rain, while those webs placed near Nero's were usually entirely ruined. Now and then when Nero had been overfed he would omit his usual economical labors.

Is it not highly probable that this pet of mine was a rigid economist—and was not the swallowed web quite soon dissolved or assimilated and stored away for future use, so as to avoid that much drain upon his nutriment? Was this an Idiosyncratic spider, or do all spiders of a certain species do the same when their webs are in exposed situations? Have any others noticed the same thing? It is not really supposed that the stability of our government or the best good of the race will be substantially affected by this trick of the spider, but it is certainly amusing and interesting.

I have a very dear old friend who doesn't live a thousand miles from Philadelphia, and whose gentlemanly qualities are only excelled by his skill in angling. This friend usually remarks upon whatever I put pen to that "it is found in Bethune's edition of Walton," or else that "it has no point." I think I see him now with his spectacles and briarwood, as well as broad brimmed hat to shade his eyes, busily overhauling Bethune to find this about spiders.

Apropos of spiders—in ransacking everything I could lay hands on to learn all possible about spiders, I stumbled upon these reported facts, which I greatly condense, hoping to amuse and not weary the readers of FOREST AND STREAM.

Quadremer Disjomval having taken part with the Dutch Patriots when they revolted against the stadtholder, was taken by the Duke of Brunswick, tried and condemned to (twenty-five years imprisonment in the dungeon at Utrecht, served him right for having such a name). Having a great liking for pets and fondness for natural history he soon began carefully watching the habits of the spiders which were his only companions. He soon remarked that invariably upon the approach of a storm the spider withdrew from his cell. A violent neuralgic pain upon one side of his head had called his attention to this action of the spiders and the changes of the weather, and he soon found that the pain in the head and the withdrawal of the spiders was invariably followed by very severe weather. As the spiders returned to their webs, so did pains leave him gradually until fine weather returned. Farther and more careful observation convinced him that spiders were in the highest degree sensitive to the approaching changes of the atmosphere, and he concluded that their general habits were so intimately connected with these changes as to make them, of all things, best fitted to announce the approach of severe weather. So carefully and accurately did Disjomval pursue his inquiries that by remarking the habits of his spiders he could announce severe weather from ten to fourteen days before its approach.

In December 1794, the troops of the French Republic were invading Holland and pushing over the ice, when a sudden thaw threatened the destruction of the army unless instantly withdrawn. The French Generals were about to accept a sum offered by the Dutch and withdraw their troops. Disjomval thinking that their success would result in his release, after desperate efforts finally got a letter to the French General in command in January 1795, in which he assured him that from the never failing signs of spiders he could positively announce that within fourteen days the weather would be so cold as to make the French masters of all the rivers and enable them to complete the conquest they had commenced. The French commander believed it and delayed the withdrawal of his troops, although apparent ruin was staring them in the face. In twelve days the cold weather came in such intensity that the ice on the rivers and canals would bear the heaviest artillery. January 28th, 1795, the French entered Utrecht and rewarded Disjomval by a release from his dungeon. The French army *did* delay its withdrawal against all seeming reason. The weather *did* become so cold as to allow of moving the heaviest artillery upon the ice, and Disjomval was immediately released. These are historic facts; how much the spiders have to do with it, the reader's own credulity must determine. *This is not in Bethune.*

TWENTY YEARS AGO.

NEARLY a score of years ago, while the deer were yet plenty in the southern part of Wisconsin, the adventure which I am about to relate, happened to one of my friends. At that time quite a number of dwellings had been erected on the north side of Buffalo Lake, in Marquette County, and the place was known by the name of Roxo. Deer were then so common that venison was considered no rarity, as they ran through the woods in incredible numbers. Late in the autumn, one afternoon, a number of men were standing on the margin of this lake engaged in conversation when a fine buck was seen leaping through the underbrush close at hand, and in an instant he had plunged into the lake with the evident intention of swimming across, as he headed directly for the opposite shore. The lake at this point was about half a mile in width, and before the deer had reached one-fourth that distance one of the men sprang into a canoe, which lay upon the beach, and was soon gaining rapidly on the noble creature. Before the deer had swam to the centre of the lake the canoe was before him and impeded his farther progress, so that by sundry splashes of the paddle and waving of the hands, the buck was induced to return toward the shore from which he started. This was exactly what was wanted, and the only man on the shore who possessed a weapon, (an Allen six shooter, commonly known as a "pepper box,") made ready to give a warm welcome to the deer. The first shot, which was fired at a distance of ten rods, did not seem to take any effect, but as he approached closer each ball was planted in his body, without, however, hitting him fatally, until he staggered upon the shore and was laid low by a well directed shot between the eyes. One of the group immediately sprang forward, knife in hand, to cut his throat, but no sooner had he stooped to despatch him, when the buck, by a quick movement of his feet, sent the knife spinning into the water some distance away, and the man himself dashed violently into the same element, which proceeding quite cooled the ardor of our friend, who appeared very willing that some other person should give the *coup de grace*, as his experience in that line had proved so unsatisfactory. The buck was by this time placed *hors de combat*, and when carried through the street the story of the "ducking" was related, much to the amusement of the villagers and the discomfiture of the victim.

Marquette County, Wisconsin.

INDIAN SELF-SACRIFICE.—Six weeks ago, says the San Francisco Bulletin, seven male Indians and a young Indian woman started to cross Clear Lake, near the northern end, in a small boat, which was capsized three miles from land. They righted it, but as the lake was rough they could not bail it out, and while full of water it would not support more than one person. The men put the girl in and held on the edges of the boat, supporting themselves by swimming till exhausted and chilled through by the cold water, and then dropping off and sinking one by one. They showed no thought of disputing the young woman's exclusive right to the boat. She was saved by their self-sacrifice.

This is a kind of gallantry not usual with Indians.

The Horse and the Course.

JEROME PARK RACES.—On Thursday last there was great disappointment, caused by the announcement that of five races on the programme but two would take place. The reasons for the withdrawal of several horses, was stated to be, dissatisfaction caused by some complication of the rules, which overloaded certain horses. Three races, however, took place.

The First Race—Was for a purse of \$500 for maiden three-year-olds. Only one horse entered, Kadi, who walked over the course.

Second Race—Purse of \$700 for three-year-old colts, three quarters of a mile; another walk over, by Whisper.

Third Race—For a purse of \$600 for three-year-old fillies. Two horses, Vandalite and Christine contending. Vandalite winning easy by a half dozen lengths. Distance one and a quarter miles. Time 2:17.

The Fourth Race—A Handicap Steeple Chase—Two and a half miles. Tammany, Bullet, Blind Tom, Electric and Henrietta entering. Won cleverly by Bullet in the very nick of time, through Midgely's clever horsemanship. Time—4:26.

—On Saturday, the last day of the spring meeting at Jerome Park, took place, and was the most successful of the season.

The first race was a dash of a half mile, for two-year-olds, with certain allowances. Willie Burke, Calvin Weasel, Littel Victorious and Ino starting. Won by Willie Burke, in a canter in 51½. The mile dash for three-year-olds followed. The following horses started:—Reform, Maccaaron, Sangamon, Attela, Henry Felter, Scratch, Australian Filly and Erastus Corning. Won by Attela, which was a surprise, in 1:44½. Attela comes from Mr. P. Lordard's stables. The third race was a handicap of one and an eighth miles. Horses starting, Artist, Fadladeen, Minnie Mac, Buckden and Minstrel. Won by Fadladeen by a length, in 1:57½. The fourth race was a free handicap sweepstakes one mile and five eighths, with two entries; Springbock and Lizzie Lucas; won by the former in a hand gallop in 2:53. The two and a half mile race to conclude the meeting, was the most exciting, and drew the greatest attention. The following horses started: Katie Pease, Shylock, Village Blacksmith, Merodac and Fellowcraft. Won by Katie Pease in 4:35½. The struggle for the finish was a magnificent one and only won by Kate in the last few strides, all the other horses being in close attendance, save Village Blacksmith.

The finish for the day was a neat brush for three quarters of a mile, between James A. and Hyder Ali, both two-year-olds. Won by James A. in 1:19. On the 18th the Ascot races were won by Sir R. Bulkeley's Leonilus, and the Biennial stakes by Mr. J. Johnstone's Tipster, and the gold cup by Mr. Delamere's Boiad.

—On Monday last, the Purse No. 3 of \$500 for horses that had not beaten 2:29, mile heats, best three in five. Four horses started, won by Tanner Boy. Time—2:31, 2:32, 2:38½. For the Fourth Purse, for horses that had not beaten 2:34, four horses started, best three in five, won by Carrie. Time—2:34, 2:33½, 2:33½. Third race, mile heat, best three in five. Brown George beat Jake. Time—2:40, 2:40, 2:42½.

—On Friday the trotting meeting of the Fleetwood Park races drew a numerous attendance. The first race for \$1,000 was for 2:25 horses, best three in five, under harness. Bruno, Crown Prince, Joker, and Barney Kelly entering. Won by Bruno. Time—2:24½, 2:22½, 2:25, 2:26, 2:25½. On the same day a three mile heat was won by Tremble. Time—2:40, 2:37, 2:36½.

On Tuesday there were two trotting races at Fleetwood. For the first, mile heats, there were two entries—Goldsmith Maid and Judge Fullerton. Purse, \$3,500, free for all. Won by the Maid, in 2:26, 2:27½, 2:23. For the second race there were ten entries. Purse \$500 for horses that had never beaten 2:31. Tanner Boy won. Time, 2:29½, 2:27, 2:31.

—At Prospect Park on Monday for a sweepstakes, best three in wagons. Three horses started, Eastern Boy winning in 2:45½, 2:46, and 2:43½. On the same day mile heats in wagons, Vulture beat Capt. George. Time—2:50, 2:51, 2:47½.

—At the Hudson County Fair Ground (N. J.) Association on Thursday, two good trotting races took place. The first was for three minute horses, best three in five, in harness, mile heats, won by Adeline. R. Time—2:45, 2:45, 2:43½.

Second Race—For 2:45½ horses, mile heats, best three in five in harness, won by Phil. O'Neil. Time—2:44½, 2:42½, 2:45½, 2:46½.

—The Monmouth Park Association will begin their annual meeting on July 4th. There will be a grand steeple chase and the Jersey Derby. On the 7th of July the Hopeful stakes and the Monmouth cup will be run for. On the 14th of July the second meeting begins, continuing on Wednesday, Thursday and Saturday. The Saratogo meetings commence on July 25th, and continue up to the 20th of August.

—At Utica, at the Utica Park Association the second annual running meeting take place on the 24th, 25th and 26th of this month. The following races were announced for Wednesday 24th:—

No. 1. *The Oneida Stakes*, for three-year-olds, mile heats, to carry one hundred pounds. Fillies and geldings allowed three pounds. Closed January 31, with eleven nominations.

No. 2. *Citizens' Handicap Stakes*, for all ages. Two miles. Closed June 4, with eight nominations.

No. 3. *Hurdle Race*, welter weights. Two miles, over eight hurdles. Closed June 15, with thirteen nominations.

THURSDAY.—No. 4. *The Ladies' Stakes*, for two-year-olds. One mile. Closed January 31, with thirteen nominations.

No. 5. *Utica Club Purse*. One and a half miles, for all ages, closed June 15, with thirteen nominations.

No. 6. *Hotel Purse*. Mile heats, for all ages. Entries closed June 18, with eleven nominations.

FRIDAY.—No. 7. *The President's Purse*. Mile heats, for all ages. Closed June 15, with thirteen nominations.

No. 8. *Consolation Purse*, \$400. One mile and a quarter, for all horses which have run and not won first money during the meeting.

THIRD RACE.—No. 9. *Grand International Steeple-Chase Handicap*, about three miles, over a fair hunting course,

weights, to appear at 12 o'clock noon the second day of the meeting; entries to close June 15.

STEWARDS—E. Z. Wright, C. W. Hutchinson, A. M. Osgood, T. R. Proctor, I. C. McIntosh. President, Erastus Z. Wright, Treasurer, Alexander Buell; Secretary, E. B. Graham.

NEW DORP, June 20, 1874.

EDITOR FOREST AND STREAM:—

Enclosed find account of two very interesting trotting events, which took place on the Richmond Club Grounds to-day. Purse, \$125, best three in five to harness, ½ mile heats.

Uncle Bill.....	1	2	2	2
Pauline.....	2	1	1	1
New Dorp.....	3	3	3	3

Time—2:44; 2:1; 2:44; 2:34.

MATCH \$3,000.

P. Duryea's Red Hot.....	2	2	1	0	2
J. Goff, Lady Woods.....	1	1	2	0	1

The fourth heat being declared dead. Time, 1:53½; 1:57; 2:4; 1:57; 1:55.

W. A. G.

—General Custer in his last article in *The Galaxy* tells of his experience in horse eating. He says:—

"We moved only a few miles, but even this short distance was sufficient to demonstrate how weak and famished our horses had become, one of them dying from starvation before we reached camp, the first day of our return march. This circumstance, however, was turned to our advantage. Much has been said and written in praise of the savoriness of horse flesh as a diet. Our necessities compelled us to put this question to practical test, and the animal had scarcely fallen, unable to rise again, when it was decided to prepare his carcass for food. That evening the men treated themselves to a bountiful repast made up of roasts, steaks, and broils, all from the flesh of the poor animal, whose death was attributable to starvation alone. Judging, however, from the jolly laughter which rang through camp at supper time, the introduction of this new article of diet met with a cordial reception.

CORNS IN HORSES.

AMONG the many trials of the horse-keeper, there is no more common and persistent annoyance, than the disease called "Corns."

The term itself is an improper one, because the difficulty which it is meant to describe, bears no possible analogy to the callous growth in the human foot called by that name.

It may be truly said that in both man and brute, the cause of the defect is in the shoeing; and there all comparison ends.

Most all horses condemned to city life, and to the ignorant care of grooms, and their confederates, the equally unreasoning shoers, are afflicted with corns.

It is a disease of which there is no outward visible sign, except in the action of the horse.

It is concealed by the shoe that causes it. Even when the shoe is removed, the corn may not be noticed, because the long, hard horn of the heels, which should always in a well shod horse be carefully pared away so that it may always be lower than the frog, covers the inflamed spot, known as a corn.

The manifestation on the part of the horse, is, however, constant. In bad cases he is lame in action; but as lameness may be caused by other injuries, it is not a decisive symptom. But when a horse occasionally shrinks as from a sudden twinge of pain when moving, and when he stands uneasily upon his fore feet, frequently shifting his bearing and keeping one hoof well out before him, it is safe to examine for corns. This uneasiness in standing may be noticed in many of the finest private carriage horses seen on the streets; it is less noticed in the better class of livery horses because their owners are generally too shrewd to allow ignorant smiths to ruin their property.

If a horse is supposed to have a corn let the shoe be removed; the inside quarter of one, or both fore feet, upon being pared, will show a streaked, inflamed appearance. The horn will be softer, and more spongy than other portions of the hoof. In bad, or long neglected cases, if you follow the corn with the knife you will come to suppuration. In all such cases one invariable condition is found, the horse stands upon a thick, heeled shoe, and the frog of the hoof cannot reach the ground.

The whole weight of the horse, rests, not upon its natural, elastic support, but upon long horny heels, and iron. This condition is a violation of natural laws, and a corn is the first, and most easily managed consequence. The smith, whose ignorance of the anatomy of the organ he has disabled, is the sole cause of the trouble, "cuts out the corn," and attributes the difficulty to "weak feet," hard pavements, or gives any excuse he thinks may answer for the moment; and puts on perhaps, a "bar shoe." He cannot tell why he puts on the bar-shoe, but he knows that it will give a temporary relief, and the relief is in this wise. The bar must rest upon the frog, and the heels be cut away, to allow it to do so. This by a clumsy contrivance of heavy iron, is getting a part of the relief that nature demands. The true relief is in such a system of shoeing as will preserve the natural action of the foot. The natural action is with a low heel, to have the frog of the foot strike full upon the ground and press upward against the downward action of the coffin bone; just as a spring acts when a weight is thrown upon it. The horse's hoof is simply a boot; inside of it is the true foot. The frog is the only part of the hoof that has a nervous connection with the living tissue inside the horn. Just above the frog is the sensible frog, and on this rests the coffin bone. This vascular bone is connected with the hoof, by elastic laminae and moves in the hoof, by the action of the horse, having its natural rest upon the frog. If the horse stands upon a rim of iron, the center of the foot is unsupported; the points of pressure are under each "wing" of the coffin bone. From lack of action the frog dries up and loses its function; the sensible frog sympathizes in this condition. Circulation and secretion are lessened. There is more or less fever, probably not perceived by the groom; or if perceived, he "stuffs the feet," inflammation begins at the points of pressure under the wings of the coffin bone, and the horse has a corn.

The cure of this defect is obvious when the cause is stated; it is to shoe so that the horse will invariably stand upon his frog; this must be secured by the use of a shoe that will admit of no other bearing and the method known among horse men as the Good-enough System.—*Animal Kingdom.*

—The Atlanta and Yale boat race has been postponed until after the Saratoga regatta.

For Forest and Stream.

HARK-AWAY.

HARK away! speed the day,
For the wildwood is waiting,
Fresh leaves and sweet blossoms the sunlight doth gleam,
While the sentinel pines
Pass the word down the lines
To summon the veterans of Forest and Stream.

Hark away! crystal spray,
Trout are leaping and flashing;
Whispering hemlocks breathe perfume at morning's first beam,
Mark the smoke, curling blue,
At the old rendezvous,
Where the blazed path is leading to Forest and Stream.

Hark away! hounds at bay,
When the late leaves have ripened;
See, the trusty guide's oar in the sunlight doth gleam,
And the rifle's sharp crack
At the wood's bivouac,
Wakens answering echoes o'er Forest and Stream.

ists' Association.

PRACTICAL FISH CULTURE.

NUMBER SIX.

THE HATCHING TROUGHS.

THERE have been few or no experiments made to test different kinds of wood in order to ascertain which, if any, would keep the cleanest under water and give out the least amount of deleterious sap, but all have used pine, which will if new often exude a jelly-like substance whose tenacity is such that a sheet several feet long and weighing many pounds can often be lifted by one end without breaking. This is not slime, nor fungus but inspissated sap which gives the water a flavor of turpentine that can be tasted. Fish hatched in such a trough nearly all die before the absorption of the sap, from the disease known as blue swelling or "dropsy." Cedar is said to be bad, according to Mr. Ainsworth's observation of trout-fry in a cedar pail, yet a cedar swamp is the place where a good trout stream is often found, and many good spawning grounds have old cedar logs around and above them in all stages of decay. The first attempt to obviate this difficulty was the use of panes of glass on the bottom, and strips of it on the sides of the trough, but from the impossibility of making perfectly tight joints it did not work well, the water was flavored with pine, and there was dead matter under the glass which perhaps bred disease, and last but not least of the objections, the fry would wedge their heads in the cracks and die there by the hundreds; so tight would they be wedged between the strips by the instinct to hide, and the growth made afterwards, that it was practically impossible to either dislodge them while alive or remove them after death.

Mr. Stone tried charring the wood, and thought highly enough of it to patent it. I have one charred trough, but have others that I like better that are not patented. The objections to the charcoal are these; the wood must be charred deeply to be of any use, and this leaves it rough and full of seams making it difficult to fit screens in or level strips on the bottom, besides it continually dirties your clothes.

Mr. Palmer has zinc troughs which I believe are not patented and are probably good if not too expensive; or a trough might be made of sheet iron covered with asphalt varnish. The writer has always held a theory that hemlock was the right wood, but never tried to test it but once, and then it was not a fair trial, for the trough was charred before it was used. Troughs have been coated with artificial slate which seems also good if the swelling of the wood does not crack it; in fact anything that will keep the water from contact with wood and will give off no deleterious matter, will be found to work well. I have used the distilled coal tar called pitch, such as is used for roofing; it requires to be put on hot, and as it is thick it is difficult to get it so even that a screen frame will fit anywhere. It will also sometimes flake off, as it was suggested that the plastic slate might. Spawn were hatched on the bare pitch, and reared on it to see if it was injurious in any manner, which it was not.

The best thing I have used is tar from the gas works, thinned with spirits of turpentine and applied with a paint brush; this if thin is absorbed by the wood, makes no coating, and therefore does not interfere with the working of dams or screens; it should be renewed every season. This is not patented, and I do not know who first used it; I learned it from Monroe Green who uses it on everything that the water comes in contact with.

The troughs can be made of any length, but for convenience in working should be not less than eighteen inches wide by six or eight inches high. A fall of one inch in five feet will give inclination enough to secure a flow. Strips of three fourth inch stuff are placed across the trough at intervals of about two feet to break the current, and the trough must be accurately leveled crossways in order to secure an even flow in every part; therefore the strips should be of uniform thickness throughout.

Instead of a dam to raise the water after the fish are hatched, I put two end pieces in the trough and by means of holes and plugs keep the water at any desired height.

If gravel is used to hatch on, get the dark colored, as the eggs show so much better; sift it to get out all coarser than an eighth of an inch, and then sift again to take out the fine gravel and sand; wash it well and distribute it evenly in the trough by "striking" with the edge of a shingle as a measure of grain is "struck." Some are so careful as to boil the gravel to kill any insect larva or eggs, and as it do not hurt the gravel, boil it if you want to, but I have never thought it necessary. The only use of the gravel is to hold the eggs in position after being evenly distributed

and so prevent the current from washing them in heaps, thereby smothering the bottom ones, and perhaps allowing a circulation under each egg as it is supported by points. I prefer gravel smaller than the egg, as there is less danger of an occasional egg getting down in a cavity and there dying unobserved. White fish eggs are hatched on fine sand. This method was very good in its day and will be used yet by some, but this winter my troughs will be fixed for Brackett's trays and Holton's box, and gravel banished for ever. The objections to gravel are that it is dirty, as mentioned above, the eggs get covered, die and generate fungus unobserved, fry get under it and die, and sediment rots beneath it; take a trough which after standing a few months looks comparatively clean on top and rake up the gravel and it will be found all black below with a foul sulphury smell.

The Coste hatching tray, made of galvanised iron with its glass grille or gridiron made to hold a thousand eggs, is neat but expensive, a nice toy to hatch a few in the house, but for business it "don't pay," and as the writer of this series is not interested in any patent contrivance, and has not even a hatchet to put an edge on, he will give his opinion of things as they seem to be good or otherwise, no matter if the best friend he has owns the patent.

The writer well remembers the remark of Mr. Ainsworth when he asked him if his screens were, or would be patented. He turned sharply on his heel and said, "No sir, I detest patent rights." I saw that a sore spot was touched, and dropped the subject, but have thought much on it since, and feel somewhat as he does, with this exception, if a man has really expended any amount of brains, and produced anything actually new and valuable, as Mr. Ainsworth did, I see no objection to his reaping a proper reward for it, and the only way in which it can be done is through a patent, yet look at the mousetraps.

I am often asked, "what does —'s patent amount to?" and although all the fish culturists in the country who hold patents or not, are personal friends, yet there are considerations higher than friendship when recommending a thing to the public who expect an opinion unbiassed by the considerations of friendship, ask "what does it amount to?" That my friend Slack advocates the trays and makes them for sale will not prevent me from recording my opinion that they are expensive toys, only fit for an amateur, and that the roller spawning box of my friend Collins (which he does not use himself) does not work as smoothly as the cuts would seem to indicate.

I used to suppose that to get a patent, some new principle was required, but here we have a charcoal box patented; fence posts have been charred from time immemorial to keep them from the fungus and rot, and the rolling screen has been used to carry straw on a threshing machine and crackers in a bake shop before the inventor was born.

We all use each others ideas more or less in this world, and the ideas of men who have gone before us, and if each little "idea" was hampered with a patent, how we would have to devour the phosphorescent fish to make brains enough to get around them all. There has been so much of this "mutual admiration" business in our new vocation that the public seem to expect more or less of it when we write, but there is getting to be too many of us to keep it up long; we will have to get down to the hard-pan of merit before long.

I noticed this particularly at the meeting of our Fish Culturists Association in New York last February. Whenever any prominent man made a statement it was received almost without question publicly, but "buzzed" afterward. I intend to give my opinion of anything connected with fish culture as far as I am able, entirely unbiassed by any considerations of friendship, and as they are over my own signature, they will only pass for the opinions of an individual interested in the advancement of fish culture, who has neither friends to reward nor enemies to punish. But to the subject;

The Brackett trays mentioned above are the invention of Mr. E. A. Brackett, Commissioner of Fisheries of Mass., and are unpatented, I believe. I will use them anyhow and if they are patented the patentee may send bill and it will be paid, for it is "worth it." The "trays" are used in an ordinary hatching trough and are simply frames the width of the trough and about two feet long, with a wire cloth bottom of about eight wires to the inch for trout, or just fine enough to hold any egg they may be required for; the wire is painted with a gas tar and tightly stretched, the frame is supported at the corners so that there is a flow of water below the egg as well as on top. Other trays can be put on top of this to the depth of six or eight, thus increasing the capacity of a trough almost indefinitely. The trays can be lifted out, the eggs sprinkled with a watering pot, the bad ones picked out, and if another empty trough is placed alongside the first one, they can be put in that, and the other scrubbed out and perfect neatness thus secured. There will be sediment from the purest water, and slime will form on wood, glass, or stone under it, and Brackett's trays are the best and cleanest thing yet invented to obviate it.

The other invention mentioned as "Holton's box" was originated by the late Marcellus Holton, and is an improvement on the "trays." It consists of a box eighteen inches square and as many deep, with a tin bottom sloping downward from each side; a tin supply pipe of three inches diameter runs down the outside and bending under the box enters at the middle of the bottom, a cap an inch above sends the water evenly on each side. A frame with two upright pieces to raise and lower it, holds the frames or trays which are made 17½ inches so as to work easily. The frames are covered with tarred wire of nine wires to the inch for whitefish, or seven for salmon trout; brook trout would want about eight. This box will take sixteen frames, and as sixty-four whitefish eggs cover about a square inch, each frame will take eighteen thousand eggs; the box 18x18 will hatch nearly three hundred thousand eggs. As the water comes up from the bottom there should be an empty frame put on top to keep the top layer down. There is a rim around the top to keep the water from flowing all over, and an opening on one side allows it to pass off where it can again be conducted in another pipe, and so up through another box whose top must be an inch lower. The same water can be made to pass through a dozen boxes, and a million eggs hatched in the space occupied by an ordinary hatching trough whose capacity is only twenty thousand! With one empty one the eggs can be looked over and cleaned every day, and the whole thing washed out, thus securing not only cleanliness but the greatest compactness possible.

This was invented for whitefish, and the one I have seen

in our State Hatching House has only been used for them, but it can be used for trout by altering the inlet. Whitefish, when hatched, pass upward through the wires, and so over the edge of the box and down stream, where they are caught in a screened box, but trout pass through downwards and would enter the supply pipe or be killed by the continual boiling and throwing against the sides. They would, therefore, require a fine bottom screen that they could not pass, or to have the bottom beveled the other way, that is, deeper on the edges, or have the supply pipe come further up and make the bottom flat so that they would not be killed by being piled on top of each other. They could then be taken out by a cock and pipe in the bottom.

The Holton box is patented, the patent is owned by Mr. Holton's mother, who has left it in the hands of Seth Green. These two inventions are really all that amount to anything in the way of improvement in hatching trout and whitefish eggs, since the commencement of the fish restoration movement in America. They secure that great desideratum, neatness and compactness, which the use of gravel can never do.

Nothing weakens an embryo trout more than being covered with sediment until it is nearly killed. It often is left with strength enough to burst its shell, but not enough vitality to live a day after its exertion.

FRED MATHER.

NOVA SCOTIA INLAND FISHERIES.

WE have been requested by Secretary Fitz Cochran, of the Nova Scotia "Game and Inland Protection Society," to print the following letter, alluded to editorially in our issue of June 11th:—

To the Editor of the Halifax Morning Chronicle:—

In your issue of the 22d instant, you re-publish from the New York FOREST AND STREAM, a letter from W. F. Whitcher, Esq., Deputy Minister of Marine and Fisheries of the Dominion, reflecting upon certain action which the "Game and Inland Fishery Protection Society of Nova Scotia" have recently taken in regard to the River Fisheries of the Province, which requires some answer at my hands; and I therefore trust you will give me space for a few comments upon it.

But, before doing so, let me say that, a short time ago a number of gentlemen interested in preserving the moose and other game animals of the Province from total destruction, formed themselves into a society, having that object in view, and after many discouragements, and a good deal of opposition, they have succeeded in passing through the Legislature a law prohibiting the killing of moose for three years, and also providing for the more efficient protection of game birds. I say that we as a society had to encounter many difficulties, and had to overcome not a few sectional prejudices, but it seems that the measure of our cup was not yet full; and, just as we were congratulating ourselves upon our success, we are doomed to the still further infliction of the semi-official "snub" contained in the letter of the Deputy Minister. It is known to many of your readers that, by the Confederation Act, the control of our river fisheries, (whether wisely or not, may be considered an open question), was transferred to the Dominion authorities, and consequently, although the name of our society implies supervision over them, we can do no more than simply advise. In this view, at one of our meetings, we passed a resolution, (subsequently embodied in the form of a petition to the Minister of Marine and Fisheries,) in which after incidentally alluding to the well known inefficiency of the present protective system as regards the river fisheries—we strongly urged upon the Minister the necessity of appointing a Superintendent exclusively for this Province, whose residence should be in Halifax. This was the main (in fact only) object of our petition, which appears to have been entirely overlooked by Mr. Whitcher, who would make it appear that the society had brought general charges of inefficiency against his department, without bringing any facts to substantiate them.

This I suppose is the meaning of the following offensive paragraph in his letter:—

"Unlike Dr. Richardson's narrative respecting the Margaree, which relates facts, the resolutions of the Halifax Fishery Protection Society, printed in your (F. & S.) last issue, ignore such vulgar materials." * *

Were I disposed to recriminate in the same style I might do so with effect, as I have abundant material at hand, but in the interests of the society I forbear.

In a letter which I addressed to Mr. Whitcher a few days ago, I called his attention to the real object of our petition, and said that if the Department wished specific facts to prove what was well known to almost everybody here, viz., that illegal spearing and netting of salmon had been going on for years in this Province, and was still being largely practised, and that few, if any, of the mill-dams were furnished with sufficient fish-ways, they could be furnished in abundance, and I instanced a case which had just come under my notice, of an officer of the garrison who had just returned from Gold River, and informed me that he had found that river almost completely obstructed by nets, set contrary to law. Upon representing the matter to the overseer, that functionary replied that it was no use doing anything, as the magistrates would not fine the offenders, and the Superintendent was too far away to back him up. The gentleman in question is prepared to substantiate the facts under affidavit, if the Department desire it. This is only one of many instances that could be given, showing the necessity of the appointment of a resident General Superintendent, whose duty it would be to visit the various localities and give his support and countenance to his subordinates, many of whom are disposed to do their duty, but are deterred from doing so from want of proper encouragement. And here let me remark, that neither I, nor the society, desire to bring any charge of inefficiency against the Deputy Minister or the principal officials of his department. Our complaint is against the system, which, we contend, is entirely inadequate to accomplish the desired object. Mr. Venning, the General Inspector for the two Provinces—a worthy and efficient officer—resides in New Brunswick, and only has time for a flying visit occasionally to this Province. The Local Inspector, Mr. Rogers, resides in Cumberland, and is seldom or ever seen in this locality, or anywhere west of this. It stands to reason, then, that under these circumstances, there can be no proper supervision of our river fisheries, and it is small wonder that they are in their present deplorable state.

But as Mr. Whiteher desires "specific statements" rather than "vague stories" I will give him a few more, and I can assure him that if he will hold a Court of Enquiry in Halifax we will furnish them to his heart's content.

I give an extract from a letter from a reliable person in Queen's County:—

"On the Medway, by far the finest fish river of this county if not of the Province, the fish were last season so nearly exterminated that years of fostering care will scarcely suffice to remedy the evil. The fish are practically excluded from most of the streams of this province. Beginning at Jordan River we find a high dam with an *approval* fish ladder so prepared, with the further information that fish are not caught at all above, and in yearly lessening numbers below. On the Liverpool river the obstructions have been such as to have brought about a virtual annihilation of the fishery, and though I am not prepared to say that an occasional salmon, more active than the rest, may not jump the dam, I am quite certain none ever went up the ladder. On the Petite Riviere, a beautiful stream once swarming with salmon and alewives, hemlock has wrought the same destruction at the hands of its stolid owners that pine has elsewhere. The LaHave, one of the largest and most beautiful streams in the province, may be said to be doubly dammed, for just above the head of navigation are two dams, in the upper and most impassable one of which the proprietors, with a fine appreciation of the necessity of the case and the sense of the community, have constructed a pretentious fish way—though it is notorious that fish cannot possibly get above the first, or least obstructive one." * * * *

Hear what an old sportsman, and one who knows from actual observation whereof he speaks, says on the subject:

"All the finest rivers in the Province, with a few exceptions, are so closed by dams erected by mill owners, (mostly foreign companies,) that the fish that formerly ascended these rivers, (by thousands,) for the purpose of spawning, are now and have been for several years entirely prevented from doing so. Fish ladders have in some instances been adopted, but which have proved utterly useless, and indeed some of them are mere traps, and are taken advantage of as such by the people living in the neighborhood. Those rivers that are not obstructed by dams are netted in every possible way by day, and the pools illegally swept with nets at night. The fish are also speared by torch light when the water is low enough, and many not taken are so cruelly wounded that they only escape to die. As a rule the wardens appointed are non-effective, some living too far distant from their work, and so are unable to give the time and proper attention required for their duties."

But I shall refrain from giving any further testimony in this letter, lest I should exceed the space you may be inclined to give me, although the subject is of such great importance as to well merit the attention of the press of the Province.

The Deputy Minister in the concluding paragraph of his letter is pleased to be facetious, when he compares the "Society pen" to the "reckless fowler who fires wildly at the flight and wounds several birds without touching the one at which he should have aimed—feathers the net result."

I trust that the facts contained in this letter are better aimed, and will reach the mark, and if the result shall be to stimulate enquiry and to obtain redress, I shall be more than satisfied, even if it is obtained at the expense of ruffling the placidity of the official plumage.

I am, your obedient servant,

FITZ COCHRAN,

Secretary Game and Inland

Fishery Protection Society, N. S.

Halifax, N. S., May 23, 1874.

PATIENCE AND PERSEVERANCE.

WE print the following characteristic letter of Seth Green from the Germantown *Telegraph* as indicating by what effort great results are accomplished:—

MR. EDITOR:—I see in your last issue that I recommend putting salmon trout in rivers.

When I have been asked by Commissioners if salmon trout will do well in rivers, I say I do not know, but that I think the experiment worth trying. We never will know if we do not try. We all know they are a lake fish.

I have them three years old that I raised from the egg in a small pond. They are fifteen inches long, and are doing well. I have put this winter one hundred thousand salmon trout or lake trout—they are the same fish—in rivers and creeks in this State. We may never see any of them again. If we do not I should say it was a failure—that is all. But if we do find they live and thrive, what then? If I had made one success to ten failures since I began to experiment in fish culture the art would be many years in advance of what it is now.

I made fifty experiments on a shad-fishing-box before I achieved a success. That was in the year 1867, and I should have been experimenting until this time if I had not made a success. That box will be the means of stocking all our rivers with shad for all time to come.

Rochester, April 9, 1874.

SETH GREEN.

FROGTOWN, June 17, 1874.

EDITOR FOREST AND STREAM:—

I notice by list of contents of the aquarium car, that Mr. Stone omitted the yellow perch from the collection this year, notwithstanding he defended them in FOREST AND STREAM against the charge of your correspondent, Fred. Mather, that they were a nuisance in eastern waters. I am glad to see that, after mature deliberation, he has discarded this fish. If those who have introduced pike, pickerel, or perch in waters that they did not inhabit before, had given more thought to the matter, they would probably have thought better of it. It is an easy matter to introduce fish that are found worthy at any time, but a very different one to remove them after they have become established; and the time may come when fish culturists will regret the promiscuous introduction of predaceous fish into all our waters. Just now, to please the sportsmen, it is the fashion to put bass and salmon trout wherever they will live, while whitefish, that furnish as good food and do not destroy other fish, are neglected, because they don't take a hook. Is it true that fish culture means cheap food for the masses, or is its object only fun for the sportsman?

KINGFISHER.

SUFFERN, N. Y., June 15, 1874.

EDITOR FOREST AND STREAM:—

About two years ago, Hon. H. R. Pierson, of Ramapo, N. Y., stocked his lake, called "Pahtak," (better known as Negro Pond) with black bass, and prohibited fishing for the term of three years. Prior to this pickerel and yellow bass, or perch, were caught in great numbers. Upon the expiration of the prescribed period, black bass were numerous and gave

great sport and satisfaction, but no pickerel and perch were found in the lake. This continued up to the present season, and I am now informed by good authorities that there are but few, if any, bass to be taken there.

Mr. P. Lorillard, the great tobaccoist of your city, stocked his lake called "Tuccedo," (better known as "Duck Cedar") also with bass; the inhabitants of the water were the same, and the result proves that bass are destructive to all kinds of fish, as found in these lakes. I believe bass are taken there still, but they have not been there sufficiently long to destroy themselves. The prevailing opinion of the anglers in this section is that bass, in a period of from ten to fifteen years, if not increased by outside supplies of their kind, exterminate themselves. Is this so?

E. S. WANMAKER.

[Fish culturists know very little of the natural history of black bass.]

—There seems little doubt in our mind that the ciscos of Geneva Lake, in Wisconsin, are the grayling of Michigan. From personal observation we know nothing; we judge from the description given us of the fish, and from the testimony of an expert angler living near the lake, who declares them to be grayling. He says that these fish, although abundant now, first made their appearance only a few years ago; that they came in some mysterious manner after the outlet had been dammed across, and that the people there believe that they could only have been brought there by waterspout. If our correspondent will take our very accurate engraving of the grayling, printed in FOREST AND STREAM of June 4, and compare it with the "cisco," he will be able to detect any family resemblance. Note the second dorsal (adipose) fin, the number of fin-rays in great first dorsal, the caudal fin rays, the (vomere) teeth on tongue and jaws, if any, and the spots on fins and sides of body. If he will pack a male and female in ice and send by express at our expense, he will increase our obligation to him and aid us to solve the question.

THE HABITAT OF THE GRAYLING.—Our valued correspondent, Hon. H. O. Collins, of Ohio, thinks he found the grayling, in 1862, in the head waters of the Wind River, which interlocks with the sources of the Yellowstone, but the Indians were too hostile at that time to permit a thorough investigation. This statement verifies the impressions of another correspondent (an army officer), which we printed a few weeks since, that the grayling was found in the streams of Montana, which include the headwaters of the Yellowstone. There seems little doubt that the fact is as stated. We have been promised the result of thorough investigations to be made in Montana next July, when the streams have subsided after the June rise.

—The Hallowell, Maine, *Observer* says that 60,000 salmon from the hatching house of Mr. Leonard will be turned into Sebec Lake the present week. The gentleman has sent several thousand to other places. He has at present confined in three tanks about 200 salmon taken from the lake, which will probably be kept there until the maturity of their eggs, which is said to occur in November. This number will probably furnish all the eggs which can be conveniently handled.

CENTRAL PARK MENAGERIE.

DEPARTMENT OF PUBLIC PARKS, }
NEW YORK, June 21, 1874. }

Animals received at Central Park Menagerie for the week ending June 20, 1874.

One purple Gallinule, *Gallinula martinica*. Presented by Capt. Thos. Eldridge, steamship City of Austin.

One Red-shouldered Hawk, *Buteo lineatus*. Presented by Miss Mary Valentine.

One Red-shouldered Hawk. Presented by Mr. R. K. Allerton.

One Agouti, *Dasyprocta aguti*. Hab. Guiana. Presented by Mr. Arnold Schramm.

Two Night Herons, *Nycticorax garzanti*. Presented by Mr. Julius Koen.

One Ostrich, *Struthio camelus*.

One African Civet Cat, *Viverra civetta*.

One Elk, *Cervus canadensis*. Bred in the Menagerie.

W. A. CONKLIN.

Woodland, Lawn and Garden.

THE FERN GARDEN A SPECIALTY.

"Fair forms of flowers, and chiefly that tall fern."

So stately, of the Queen Osmeanda named;
Plant lover here in its own retired abode
On Grassmere's beach, not far from Naiad by the side
Of Grecian brook, or lady of the Mere
Sole sitting by the shore of old romance."

TO speak of a fern garden as a specialty may seem to many a talk upon an unknown subject. "Ferns," say some of my readers, "what are they? To what department of garden plants do they belong? Can we cultivate them easily, or are they troublesome, and will they require labor, and do they cost much money? Can I have them in my garden, or where shall I place them? Please give a few hints for the use of such persons as may be desirous of cultivating these curious plants, and you will oblige many lady readers of FOREST AND STREAM." As an answer to our lady friends, and L. S. L., of Pennsylvania, we would say that the fern garden can be quite easily constructed, and will doubtless give you ample satisfaction. You will find care in the selection and choice of plants more difficult than any other part of your garden. Fine, thrifty, beautiful plants of the fern will grow as a general thing where many other fine and delicate plants would die outright. Not that our ferns are not delicate, and possessed of exceeding beauty. The fern requires much moisture and shade—this is their natural element.

Did you never take an afternoon ramble out in the dense

woods, beside a quiet, meandering brooklet, whose silver waters danced and sparkled over the smooth pebbly bottom, or gathered in little pools ever and anon beneath the cool, delightful shade? Perhaps all who love to ramble in the woods do not go out in search of ferns. To such as would make a delightful fernery in their own garden we would say, they should first go out into the woods and study the ferns there; it will amply repay them, and the information they receive will aid them much in the construction of their own fernery.

The fern, although loving the water, loves not the stagnant pool. Water is their true element—cool, bright, sparkling water, percolating among the mossy fronds and rootlets amid the streamlet's sides. Here amid the home of the ferns you are to learn from observation that although they will grow almost anywhere, there are situations in which they delight to live. Ferns love to live, and brighten almost any place. You can have them anywhere I had almost said, but the darkest and dampest corner of your garden suits them best, and here they will grow and enliven places that without them would be unsightly. Obtain from the brooklet's side one of these large fern fronds or roots, and transplant it to your own half dozen boulder rocks, and how gracefully they jut up between the interstices of the rocks among the lycopodiums and moneywort.

The fern so rapidly adapts itself to all situations that we are at a loss to comprehend the reason why as a pot plant, and for numerous other ornamental uses, they have not been universally admired. As ornamental plants, the ferns are not surpassed by any others when particularly used. What grand effects can be produced by the introduction of the different species into large rooms with deep windows. Bay windows or recesses may be made to rejoice even in mid-winter in the presence of the ferns. It is not necessary for the sun to shine on these quiet, retiring beauties of the shady woods; therefore the most secluded nook, the shadiest corner of the room, is just the place for a shelf of ferns, say six different, hardy kinds, which may be found in an afternoon's ramble by your favorite brooklet. Let the carpenter put up a shelf in the window, and construct you a box one foot wide and one foot deep. This is your window garden for ferns. As the ferns have been taken from the woods, give them some of their own soil to live, grow and thrive in. To make your little fernery complete, cover the box with growing moss from the woods, and you can study them and love them as you will at your ease. I have seen many rooms made beautiful by a very simple and easy arrangement of ferns. Steps, rising one above the other, as upon a simple flower stand, upon which ferns in pots are placed in long, tight boxes that will hold water, will give you one of the grandest effects imaginable.

The hardest kinds, after having gladdened the summer season in the garden, may be removed to the house in the winter, and will live and thrive equally well with but little care. For winter use you will need to shade them from the direct rays of the sun by means of a curtain, let down between the plants and the glass.

In making your garden fernery you can choose any place you desire, and the shadier the better. I have often covered an old and otherwise unsightly wall with the fronds of the largest "brake," as they are called in the country, with very pleasing effect. There are some ten different kinds of ferns common to our woods, which only ask water and earth, and in return for the same give you much beauty. First, you can make an ornamental structure of rock work, of an uneven surface or wall, into which you will place your pots for your plants. Compose this entirely of ferns, if you please, or mix them with that kind of plant that lives amid the shady wild wood. You are now supposed to be able to select your own stock, and to know pretty well how to choose the different kinds of flowers, and to understand the laws of assimilation. There are no set rules to be given for the construction of these beautiful little fern spots in the garden. Here we say to you again, study Nature; go to the woods if you have forgotten my instructions, and see that old rotting stump—that beautiful deep green frond of the lycopodium, just beginning to unroll its russet leaves. Look on this side and see the beautiful tracery of the *Canis minor*, or little dog fern. Is it not superior in its delicate net work to any of the most costly imported lace work? Certainly, and you can have them just as they are here, at your own garden home. Place your garden trowel carefully under this little dog fern, and lift it into the basket. There, you have it, and you have not disturbed any of its rootlets or moved the soil. Now take it home with you, and place it in that old stump that lies by the corner wall, often filling up its interstices with soil, and here let it grow and thrive as it will if you give it a little water each week. Now sow some nasturtiums and sweet mignonettes, and you will rejoice for hours in the little your hands have done with the ferns. Here your taste may lead you to add, with much effect, one or two roots, in large pots, of the canna, the caladium esculentum, and two or three recinus, among which a few of the nasturtiums give much beauty and cheerfulness to this pretty little pastoral picture.

We could elaborate from the first simple lesson among the ferns, and write not an article, but a book, upon the different arrangements and beauties of the fern garden, but as our object was merely to guide a thought, to answer a question or two asked by our lady friends, we prefer to leave with them the further study and practice of making a fern garden, having the fullest belief in their ability to carry out in full the scope of our initial suggestions.

OLLIPOD QUILL

KANSAS WILD PLUMS.

We have received the following letter from Jackson Gillbanks, Esq., a frequent contributor to *London Field*, and recommend its contents to the consideration of our numerous friends in Kansas in hope that some of them will give the subject attention. We should be obliged for a description of the tree or bush and a handful of the seeds or stones as soon as the fruit is ripe, some of which we will take pleasure in forwarding to Mr. Gillbanks:—

CUMBERLAND, Eng., May, 1874.

EDITOR FOREST AND STREAM:—

A writer signing himself E. A. C. in the *Field* newspaper, gives a series of articles on the interior of America. Among other things worth notice that he meets with are sandy, barren plains in Kansas, on parts of which were immense quantities of plum trees "not larger than our gooseberry bushes," bearing fruit of enormous size and most luscious flavor. It strikes me as being odd that when travelers a long way off meet with a great curiosity like this, by some unaccountable oversight they generally neglect to bring home a specimen or seed thereof. Now, common experience shows that any one bringing to England a fruit tree as described would realize a fortune at once; since if it would not stand our winters, it would be admirably adapted for orchard houses now quite common. I have written to our *Field* newspaper in vain for more information about this tree or bush. I hope some of you across the water will clear it up, and help me and others interested. I saw it alluded to in a northern expedition, where it was said to be so juicy and sweet as not to require sugar, either raw or cooked. At present I and other lovers of nature's good gifts are eating it in imagination, *cum grano salis*.

JACKSON GILLBANKS.

Natural History.

For Forest and Stream.

THE NEWFOUNDLAND DEVIL FISH.

MR. SAVILLE KENT, an eminent English naturalist, has published an article on "Gigantic Cuttle Fish" in the "Popular Science Review," in which he announces it as his opinion that the cuttle-fish discovered by the Rev. M. Harvey in Newfoundland and described and photographed by him, is a new species, and different from that described by Professor Heenstrup, under the name of *Architeuthis monachus*. Mr. Kent has proposed to the Zoological Society that this new species be named *Megalotenthis Harveyi*, "in recognition of the services rendered to science by Mr. Harvey, in securing and describing" this extraordinary specimen.

Professor Owen has divided the cephalopoda into orders; the one including the Pearly Nautilus, called *Tetradactylata* or four-gilled; the other including the rest of the existing species, named *Dibranchiata*, or two-gilled. To the latter order belong the cuttle-fish, (*tepiadae*).

It is remarkable that of the great division of cuttle-fish called *Tetradactylata*, there is but one living representative, namely, the pearly nautilus, with numerous arms unprovided with suckers, no ink-sac, and an external many chambered shell. All other cuttle-fish belong to the *Dibranchiata*, or "two-gilled" order, and have either eight arms, as the octopus, or ten arms as the calamary or squid. The Newfoundland specimen is a calamary, having ten arms, the two largest being twenty-four feet in length. Professor Baird discovered a new species of octopus in the Bay of Fundy which has been named in honor of him *Octopus Bairdii*. It is of course very different in appearance from the Newfoundland calamary, its eight arms being connected together by a partial web and used as an organ of locomotion as well the siphon, through which water is ejected in swimming backwards. The octopus is small, all the specimens hitherto found being males. It is well known that females of this genus are usually very much larger than the males—in fact of utterly disproportionate size; so that it is quite possible that the female *Bairdii* may be of formidable dimensions. The same is possibly true of the gigantic calamaries of Newfoundland; which may account for the difference in size of the two specimens lately seen, of which one was said to be sixty feet, the other only seven or eight.

Professor Verrill, who has now in his possession various portions of the *Megalotenthis Harveyi*, as Mr. Kent has named it, will be able to determine whether it is really a new species, or identical with that described by Heenstrup. The learned Professor has got the photographs engraved for his new work on the fishes of the North Atlantic; and no doubt we shall speedily know his decision through the medium of one of the scientific organs.

The geological record makes a remarkable disclosure regarding these great orders of cuttle-fish. During the Palaeozoic Ages, the oceans and seas swarmed with the "four-gilled" cuttle-fish, their beautiful external shells being now found as fossils in the older rocks; but as the earth advanced towards its present condition, these curious forms slowly died out, leaving the pearly nautilus their only living representative. On the other hand, the "two-gilled" cuttle-fish have no representatives in the earlier periods of the earth's history, and only now seem to have reached their full development. The pearly nautilus occurs in almost the oldest rock formations in which traces of living organisms are found, and still holds its ground in the great battle of life.

Permian, one of our older naturalists, writes thus of the octopus, or eight-armed cuttle-fish:—"In the Indian seas this species has been found of such a size as to measure twelve feet in breadth across the central part, while each arm was fifty-four feet in length, thus making it extend, from point to point, 120 feet." He further states that "the natives of the Indian seas, when sailing in their canoes, always take care to be provided with hatchets, in order immediately to cut off the arms of such of these animals as happen to fling them over the sides of the canoe, lest they should pull it under water and sink it." This account, which has hitherto been laughed at, receives a remarkable confirmation from the incident which took place last October, in Conception Bay, Newfoundland, when a gigantic cuttle-fish flung its arms over a fishing boat and would have sunk it but for the prompt action of a fisherman who cut off the tentacles with a tomakawk.

St. Johns, Newfoundland, June 10th, 1874.

—What! the noble Dane without a rabbit? But so it is, for *La Chasse Illustrée* tells us that the Danish Government have just bought 50,000 rabbits in France to repopulate their country. What a multitude of cotton tails to be sure.

GRAYLING OF MONTANA.

HELENA, Montana Territory, June 8, 1874.

EDITOR FOREST AND STREAM:

I notice in your issue of May 28th last a correction from your correspondent "Monmouth," referring to his previous interesting letter in regard to the Yellowstone Valley. One very fine cañon of the Yellowstone, sketched by Mathews, and lithographed for publication, can be reached from Fort Ellis in a very few hours, being about twenty miles from that place and ten or eleven above the Crow Indian Agency.

There are trout galore in the Yellowstone. I have caught a thousand a week frequently during a twenty months' residence at the Agency mentioned; and, furthermore, there are grayling there, the veritable *Salmo Thymallus* as depicted in Ronald's Fly-Fisher's Entomology, which work I have by me as I write.

The employés of the Agency were in the habit of throwing them away, calling them white suckers, and "no account," until the sergeant in charge of the few troops there told me they were as good as trout, and after a terrible fuss with our cook, who thought it beneath his high toned art to "cook suckers" in a trout country, we had some for supper, and pronounced them good as trout.

We could always tell a grayling's bite from that of a trout; the rush is harder, but they weaken quicker, have not the "leather" in them that trout have.

During this season I may drop you a few remarks on our fish and fishing. I am very fond of the sport. We have several varieties of trout. Some men who fish for a living declare that one variety is a hybrid between a trout and the grayling I have mentioned; this matter I shall try to investigate.

One thing you may assert, trout are caught in the Missouri river, in the main stream, I mean, below the three forks, at what is called "the Gate of the Mountains." They are not plenty, however. More of this, too, anon. In haste, yours.

STUMP.

[These statements are corroborative of others made by our correspondents in previous letters.—ED.]

FAUNA OF NEWFOUNDLAND.

ST. JOHNS, Newfoundland, June 7, 1874.

EDITOR FOREST AND STREAM:—

Your letter of the 6th ult. I only received two days ago, having been absent on a visit to Canada for some weeks. I shall be glad that the misstatements regarding this country, which have appeared at different times, may be rectified through the columns of your journal. I never saw your issue of 21st of May, and never read the article on Newfoundland. I must take the liberty of correcting a misreading of my lecture quoted in that article, which perhaps you will kindly show on a future occasion. You say at one part "Wild swans and geese are absent." Wild swans are absent, or at all events I never heard of any having been seen; but wild geese, *anas canadensis*, come in enormous numbers and breed all over the island.

Again, as regards fishes. Although I can only identify two quite distinct species of trout in these inland waters, I have no doubt that a professed naturalist would in all probability discover many more; and further, I would say, so far as sport goes, I imagine there are few parts of the world where better could be found. The sport with sea trout and salmon is even now very good, and were it not for the barbarous practice of barring the streams it would be equal to any in America.

Speaking of the caribou, I have not stated that they could not be tamed. On the contrary, they can be very easily tamed, but they never appear to live for any length of time under restraint. I have caught and tamed two—a stag and a doe fawn—myself, which became as tame and as friendly as a dog, but both died when a little over a year old; and I have known of many similar instances, besides having the evidence of the doorkeeper of the Zoological Gardens, Regent's Park, London, to the same effect.

As my name may be called in question regarding these matters, I will be obliged by your noticing my present statements. I am sending you a copy of my official report for 1873, which I hope you will glean some little information from, and beg to subscribe myself yours, very faithfully,

ALEX. MURRAY.

JACKSON, MISS., June 15, 1874.

EDITOR FOREST AND STREAM:—

I have been somewhat astonished—not at the great interest taken in "Do Quail Withhold their Scent?"—but that any one should doubt it. My first lesson in partridge shooting (I mean "Bob White" when I say partridge), after the covey started and I was more than eager to go for the single birds, was to wait and let the birds give out their scent, of which, as Mr. Laverack says, Mr. E. S. Wammaker has given the best and the only rational explanation. As probably some of your readers would like authority, I would give them Frank Forester's "Field Sports," vol. 1, page 269, edition of 1848, where he says:

"This cunning little bird, having either the power or the peculiarity of retaining its scent for some time after alighting, when it is alarmed, so that the best dogs in the world shall fail to find it. This may be an accidental provision of nature, possibly owing to some contraction of the pores and consequent check of the odoriferous effluvia, owing to alarm, &c., &c., and goes on to say that he thinks "quail can withhold their scent voluntarily," also citing instances when good dogs could not find the birds of scattered coveys until after the lapse of some time. In regard to the latter, Lewis' "American Sportsman" says on page 98 that "this seeming deficiency, however, in the olfactory organs of our canine favorite is now easily accounted for by the presumed existence of a singular provision of nature, which endows the American partridge with the extraordinary faculty of withholding, for a time, the emanation from its body of that peculiar strong odor that betrays its proximity to the dog." Lewis then gives a letter from a gentleman, who seems to have made it a specialty, to fully determine the question of "withholding scent," and proves it by making various trials with good dogs on scattered birds.

Will you please tell Fred Beverly that I throw up the sponge about hammocks. Webster spells it with n, o and a, so I presume we pay our money and we take our choice." Yours truly, GEO. C. EYRICH.

IMPORTATION OF THOROUGHbred DOGS.—By the Williams & Guion steamer "Wyoming," which arrived a week ago last Monday, our correspondent, "Mohawk" received from the kennel of Mr. Macdonald, a very handsome liver, white and tan setter dog, named "Milo," a cousin to the great Ranger. Also a handsome liver and white pointer bitch called "Naylor."

—The Canadian government is enforcing game laws in a model manner. Steam tugs are employed on the St. Lawrence in searching for seines and nets, and on shore officers keep a close watch.

Sea and River Fishing.

FISH IN SEASON IN JULY.

Salmon, <i>Salmo Salar</i> .	Salmon trout, <i>Salmo confinis</i> .
Trout, <i>Salmo fontinalis</i> .	Shad, <i>Alosa</i> .
Land-locked Salmon, <i>Salmo gloveri</i> .	Michigan Grayling, <i>Thymallus tricolor</i> .
Black Bass, <i>micropterus salmoides</i> .	<i>micropterus nigricans</i> .
Striped Bass, <i>Roccus lineatus</i> .	Sea trout, <i>Salmo immaculatus</i> .
Bluefish, <i>temnodon saltator</i> .	Weakfish.

We beg our friends throughout the country to send us frequent notes on angling, both sea and river fishing. Let us know the size and quantity of fish taken, kind of fly or bait used, the run of fish, stage of water, temperature when practicable, number of rods on the stream or stand, improvements in fishways, lodging accommodations, general facilities, routes, means of transportation, celebrities abroad, number of summer tourists and sportsmen, and any other information of interest or value to sportsmen. Remember that each contribution to the general fund of knowledge will prove of mutual and reciprocal service.

—There is an abundance of salmon in market. Of course we do not mean to say that at thirty cents a pound you could gorge 'prentices with salmon, but still it is in plenty. Very possibly when our paper is read salmon will be worth but twenty five cents. The noblest in size come from the Quebec region, and we handled one of fully forty pounds. Big fish are not liked; it is the smaller ones, running from ten to fifteen pounds, which are most in demand. Native salmon still scarce. Trout from Canada, in elegant condition, at about the same figures as last quoted. Blue fish are now caught all along the coast, as far north as New Bedford. Sold at eight cents a pound. Just as our last issue went to press a big school of striped bass struck Squan Beach. A catch of eighty-six weighed forty-four pounds each. Monsters are seen everywhere in the market, and are worth from ten to twelve cents a pound. Scattering lots now coming in from the north of us. There never was a more plentiful season for sheepsheads. Usually they fetch twenty-five cents a pound; this year they are bought for eighteen cents. Fishermen are catching them all along New Jersey and Long Island. Spanish mackerel still coming from Norfolk and the Chesapeake in fair quantity. One we looked at weighed six pounds. We have seen them when they have been caught further north to turn the scale at nine pounds; worth fifty cents, a shade higher than they have been. Shad have departed, and the last run has gone. Kingfish scarce; worth twenty cents, and coming from Long Island. An exceeding quantity of green trutle, which, the bigger they are, the cheaper they are. You can take home on a dray a five hundred pounder for eight cents a pound; but a nice little one, a wheelbarrow turtle, costs as much as eighteen cents. Soft crabs rather diminishing in number, but in active demand at \$2 a dozen. It has rained a shower of frogs legs, and yet there is no plague. Canada now sends her supply; price down to thirty cents. Even Mark Twain's jumping frog would not bring more, when properly dressed, than the before-mentioned figures. Pretty blow fish, animated sea-bubbles, are now seen in the market. You apply your lips to their mouths, blow away, and they swell up like a balloon. The tongue of the fish forms a tight-fitting valve, you blow in, the fish swells, but the air can't get out. At Mr. Blackford's we saw a fine specimen of the Hawksbill turtle (*Caretta imbricata*), the real shell trutle, from whose plates our tortoise shell combs are made. There are thirteen scales on his back, which overlap each other. This nice creature will go to Central Park, Mr. Blackford having presented him to the collection.

—During the week ending June 19 ninety-nine arrivals were reported at Gloucester. Forty-two of these were from George's Bank, with an aggregate catch of 852,000 pounds of codfish; eleven from Grand and Western Banks, five bringing 505,000 pounds of salt fish, and six with 172,000 pounds of halibut; and forty-six from Southern trips, forty-five of which brought in 8,841 barrels of mackerel, and with 200 barrels of porgie bait. The Southern mackerel fleet met with good success during the past week.

—There are very few fish at present in Canarsie Bay, though there is a fair run outside. Charley Fox took the first Sheepshead of the season at Rockaway Beach on Wednesday last.

—Sheepshead are biting at Barnegat, and fishing will be good in a week or two.

—Old fishermen, who know every nook and crook within twenty miles of New Bedford, say that salt water fish are more plenty this year than has been known for several seasons.

LARGEST BLUE FISH REPORTED.—I. Hathaway Esq., a veteran fisherman, captured on the 16th inst., while fishing from the bridge at Cohasset Narrows, (Mass.) with rod and reel, a blue fish weighing twenty-five pounds, certainly the largest ever caught there, seventeen being the next largest recorded. Do our friends at Barnegat find larger ones?

—We have received from the Secretary of the Blooming Grove Park Association the following notice to members:—

40 Fulton Street, June 18th, 1874.

The shooting season will open July 4th. Trout and black-bass fishing now good. Please inform us what dates you expect to be at the park, so that we can arrange for conveyance, etc.

JOHN AVERY, Secretary.

—The Muncy Trout Company, of Lycoming Co., Pa., very kindly send us an invitation to be present at their coming festival, which is to commence on June 29th. These are beautiful grounds, and trout are to be had for the catching every day, and there is something most inviting when guests are requested as per programme "to bring strong tackle, as many of the trout weigh from one to three pounds." The ponds are situated in the Muncy Valley, in

sight of Muncy and Hughesville, and fifteen miles from the city of Williamsport, Pa. There are fifteen acres of forest and a half mile of stream and ponds. As to lodgings, you can take it *al fresco* in a tent or at the hotel. We like the association of trout and good company. It is as peculiar as it is American. You can go from Philadelphia, by the Reading railroad to the Muncy trout ponds.

—It is said that the fishing at Grand Lake Stream, Maine, was never better than it has been this month. Mr. Neill, of Calais, killed fifty-eight land-locked salmon in one day and others report success quite as worthy of record. The Dobsis club during the visit to their camp had excellent sport, the size of fish killed being very much above the average, running from two to three and three fourths pounds in weight.

—A party of Boston gentlemen just arrived from Moosehead Lake represent the fishing as unusually good. The best localities they found were Moose River, North Bay and Spencer Bay. At Moose River they took seventy-two trout, weighing from one to three pounds. Misery River is also a good stream.

—Our attentive correspondent, Dr. Kenworthy, sent the following fishing notes from Barnegat one day too late for publication last week:—

Two weeks since I communicated with you from Barnegat, and reported our catch of blue fish, and remarked that "the fishing was poor." You published an extract from my note, and stated that you considered such fishing good. Now, sir, although you may be an experienced fisherman, I am prepared to prove that you are very "poor" authority as far as "good" blue fishing is concerned.

Since my communication appeared I have met a number of the readers of FOREST AND STREAM at Barnegat, and through the boatmen have heard from others who have visited this locality. All seemed disposed to receive my statement as a "fish story," but upon inquiry, and testing the matter for themselves, they found my statements true to the letter.

I have just returned from another trip to Barnegat, and have enjoyed what I call "good blue fishing." Late last Thursday night I received a telegram from Capt. Joel Ridgway to this effect:—"Large blue fish plenty; come." I arrived at Barnegat on Friday evening, and commenced squidding on Saturday morning at eight A. M. Three P. M. found me sore, crippled, and demoralized, and very willing to cry quits. Upon our arrival at the landing we counted the catch, and found that we had captured 268 fish. Capt. Ridgway landed five, and "Al Fresco" 263. Weighing the fish was too much of an undertaking, so I obtained the opinion of several old fishermen and fish dealers, and the lowest estimate was 1,200 pounds.

Monday morning was calm, and I commenced squidding at half past nine, and abandoned the sport at half past three P. M. Upon counting the day's catch I found that I had personally landed 261 fish; estimated weight, 800 pounds.

Tuesday found me pulling and hauling blue fish at half past seven A. M., and at half past eleven it was blowing a gale, with the dust flying half mast high. Deeming prudence the better part of valor, I beat a hasty retreat in search of dry garments. Upon arriving at the landing we counted results, and I found that I had captured 153 fish, estimated at 600 pounds.

Although the weight was estimated by old fishermen and fish dealers, I am convinced that they weighed more than the figures given. Fishing time, seventeen hours; number of fish landed by one pair of hands, 677; number of fish landed per hour, 39; weight landed per minute, two pounds. This, Mr. Editor, I call "good fishing."

I must confess that I am an active man, and lost no time in eating, drinking, or smoking. My success I attribute to good tackle, and the efficiency, knowledge, and seaman-like qualities of that prince of boatmen, Capt. Joel Ridgway.

I have tested the qualities of most of the hotels at Barnegat Bay, and if you or any of your friends should feel disposed to visit that locality I would advise them to try the Mullen House, kept by King, at Pitman.

AL FRESCO.

CANADIAN LEASED RIVERS.

NEW YORK, June 20, 1874.

EDITOR FOREST AND STREAM:—

To save trouble and disappointment to many who may have determined, (after reading your correspondent, W. E. F.'s glowing description of his salmon fishing at "Middle Landing" last year,) to try the Nipessing River this season, I would like to say that the place is leased and not free, and that all the room there is already spoken for.

If you would kindly make it understood that every salmon stream on the Bay of Chaleur worth going to, is already leased, you would do a service to those who might otherwise direct their steps thither only to be disappointed to find the sport unattainable; and at the same time many lessees the disagreeable necessity of refusing applications from those who may have come all the long distance for nothing. Neither experience is a pleasant one, I assure you.

You understand the fact; but Americans—accustomed to free fishing in our woods—find it hard to believe that sport is not open to all on the wild rivers of Canada.

Yours truly,

AMSTERDAM.

—The Kentville, Nova Scotia, *Chronicle* mentions the fact that four English sportsmen have taken thirty fine salmon at Gold River this season, which is significant, inasmuch as some of our correspondents who fished that river last season reported it barren of salmon, having either not seen or heeded our directions to go early.

MURKIRK, Md., June 17, 1874.

EDITOR FOREST AND STREAM:—

I saw a communication in the FOREST AND STREAM that black bass could not be caught with a fly at Little Falls of the Potomac. I have not fished there, but can say that on the 20th and 21st of May at the Great Falls of the Potomac I caught eight black bass with flies, landing pairs twice. The water being high the fish did not take the fly very well.

Yours truly,

C. E. C.

TORONTO, June 12, 1874.

EDITOR FOREST AND STREAM:—

When I wrote last I mentioned the fact that there was a little lake (Geneva) in Wisconsin which is full of grayling. To-day a gentleman from there states that a dam at the outlet of a little lake near Troy in that State had given way and that the inhabitants had taken away the grayling in cart loads.

Judge Potter, of Toledo, told me yesterday that he took two grayling last July in the St. Mary's River, near Point Aux Pins, while fishing for trout.

Yours ever,

JAMES H. RICHARDSON.

P. S.—I got one of Orvis' rods, the light one, and find it a beauty.

DIXFIELD, Me., June 15, 1874.

EDITOR FOREST AND STREAM:—

I returned from the Rangely Lakes yesterday, having stopped there three days. Found the fishing excellent and large. A few warm days will bring them to the surface, and will also bring the black flies and mosquitoes. The fishing for the past week has been done entirely in the lake. The most successful mode is by trolling with a minnow. We found the fishing good in any place where we tried, whether near the shore or in the middle of the lake, not very difficult, the size of fish ranging from one to six pounds. The season is nearly two weeks later than usual. We took 2,000 land-locked salmon from my hatchling-house at Dixfield and turned them into the Rangely waters without the loss of a single fish, and that over a road of sixty miles without a change of water. I hope to see the day when the land-locked salmon will be abundant in those waters, and think they will grow as much larger accordingly as the brook trout do compared with other sections on this continent.

Truly yours,

HENRY O. STANLEY.

NORTH CAROLINA COAST FISHING.

CAPE HATTERAS LIGHT STATION, May 16, 1874.

We are permitted by courtesy of Prof. Baird to print the following interesting letter:—

Professor SPENCER F. BAIRD, Commissioner of Fish and Fisheries, Smithsonian Institute, Washington, D. C.:

SIR—Your communication of 27th ultimo is now before me, in which you express a desire to engage my services in obtaining information in regard to the different kinds of food fish that frequent the waters of this portion of the "Old North State." I can only renew my offer to you in a letter of a previous date to "furnish you all the information within the narrow limits of my experience." In your letter—whose receipt is here—by acknowledged—you speak especially of the bluefish (*Tailor*), true mackerel, Spanish mackerel, the sword-fish and sea-herring.

The Bluefish, or *Tailor*, is found in the waters of North Carolina all the year round. It is seen and caught in great abundance from first of March until last of December, and to some extent in the months of January and February. Those taken in spring and summer are about one-quarter to one-half grown, and are generally caught in the Sound—never very near the inlets. They are caught in small set nets or drag nets of large dimensions as to length and depth. Seines are not used for them until the full grown fish, commonly called here "the Big Tailor," make their appearance, which is in November. The Big Tailor generally come by sea from the north, and are seldom seen in the sounds. Their approach is foretold by the Fatback, which make their appearance about two days ahead of the Tailor, and when the body of the Tailors arrive on our coast they have ahead of them schools of Fatback that would measure acres in dimensions. The Fatback are driven in by the Tailor next the surf or beach, and if the surf is rough they are washed ashore in large quantities. The Tailor is taken in seines, put out to sea from large flat-boats or skiffs made for the purpose, in smooth weather; but in rough seas the fishermen have anchors planted at sea a sufficient distance from shore to allow a seine to be hauled at the full length of it to sea. A hawser is attached to the anchor by means of a block through which it passes, with both ends leading on shore, passing through a second block attached to a "Sampson post" on the beach. One end of the warp is made fast to one end of the seine, and it is hauled off into the sea and back to the shore immediately. I have known thousands to be landed at a "set" in this way. I have seen them so numerous in the surf that hundreds have been caught in a few hours by men with spoons made of large wire, long spikes, old bayonets, and last full a little brother of mine caught five in ten minutes with a common yard rake, walking along the surf; and they were so numerous that some of the ladies who were at the seine for curiosity's sake, caught several in their hands. They seemed to be so eager after the bait (fatback) that the sea would wash them up on the beach, and in many instances recede and leave them on dry land. In such times they may be seen for miles at sea with their tails and fins above water. It is strange some one here does not prepare extensively for salting this fish for the market. There is not a permanent fishery for them on this coast. There are, however, large quantities of them caught and sold from here. They generally sell for from 2 to 4 cents per pound, and as high as 50 cents per fish. They are sold in this State to farmers principally.

The true Mackerel is seen and caught in our Sounds in August, September and October, but in small quantities.

The Spanish Mackerel is seldom seen in the Sounds. It is caught in small quantities near the shoals at the point of the cape.

The Sword-fish is also seen and sometimes caught in the Sounds, but is never made use of here. It is sometimes seen at sea in large quantities in November and December.

The Scudder, or Sea-herring passes our coast, but is never seen in the Sounds, and never caught. I am not prepared to give any information in regard to the time, place, or any circumstance connected with the spawning of any of the different species of fish named above. We have, in addition to those referred to, several other species of food fish, which are caught to a great extent and are excellent food, some of which are the Spot-bream or Pinfish, Hogfish, Yellowfish, Trout, Speckled Trout, Sea Mullet, Sheephead, Red-drum, Hake, &c., which I will treat on at another time. Very respectfully, your obedient servant,

A. W. SIMPSON, JR.

Answers To Correspondents.

B. Todd, Middletown, N. J.—Get "Fishing in American Waters," by Genio C. Scott. Think the price is \$2.50.

E. D., Boston, Mass.—Can furnish back numbers from date of first issue of the paper.

W. H., Brooklyn—Please tell me in your next issue when law for woodcock is off in Massachusetts? Ans. July 4th.

Keno, Rome.—Where can I go and have real sport blue-fishing? Ans. At Barnegat. See columns of this paper this week and a month past.

SANTI.—How can a canoe be taken from New York by canal to the nearest point on the Ohio River? Ans. Does any reader know?

L. S. G., Boston.—Is there good shooting at bay birds on the New Jersey shore in September? What would be the expense of getting there and shooting, for say a week? Ans. 1. Yes. 2d. About \$25.

J. D. AND S. F. AND OTHERS.—Think we can procure you a copy of "Superior Fishing." Being out of print you may have to pay more than the original price of publication.

J. W., Philadelphia.—Have your shells 2½ inches long so that they can reach up to the "taper" in the gun. Do not cut them off. Use Hall's patent creaser. Dupont's No. 5 is pretty nearly like Curtis & Harvey's No. 6.

W. & Co.—While we should be much pleased to accept your advertisement in these hard times, we must decline it, as we cannot conscientiously advocate the use of reflectors or other devices for fire-hunting or "jacking" deer.

Boston.—Is there good fishing at Moosehead Lake the last two weeks

In August, and what kind? Are there any black bass? Ans. August and September are the best months. Trout in the streams and "lakers" in the lake. There are whitefish, but no black bass, we believe.

A. J. K., New York.—Is Conshocken a nice place to go to this summer? 2. How far is Germantown Junction from Philadelphia? 3. What is the fare from New York City? Ans. 1. It has no prominence as a summer resort. 2. About 6 miles. 3. \$2.15.

F. N. S., Brooklyn.—What do they charge for board in the Adirondack Mountains for a boy of 17? 2. What kind of game is there to be found and is there good fishing? Ans. Board \$2.50 per day for good-sized boys of 17. Deer and bear, rabbits, squirrels, for game. Yes; good fishing. Good place to go to.

A. F. & J. P., New York.—Is there any trout fishing in the Catskill Mountains in the vicinity of Cairo? Ans. Not familiar with vicinity of Cairo. Fair fishing, though not first-rate through the Catskills generally. 2. What would be the expense for ten days from New York City? Ans. Eight to twelve dollars a week for board. 3. Are the accommodations (hotels, board, &c.) at Waretown, N. J., as good as at Barnegat? Yes.

P. W. T., Washington.—Do you know of any good fishing places either in Baltimore or St. Mary's county, Md.; if so, how can one get to them? Ans. Good fishing in Britain's and Choptico Bays and all along shore of Potomac River. Take stage from Washington to Leonardtown, St. Mary's county. See FOREST AND STREAM Sept. 25th and Oct. 2d.

J. B. R., Philadelphia.—Please inform me to which county or counties, this State, there is the best deer hunting, and where in Pennsylvania would you advise me to go for the most sport? Are deer plenty in McKean county? Ans. Best deer counties in Pennsylvania are McKean, Elk, Potter, Sullivan and Lycoming.

C. W. A., Newark.—Which is the best manner to keep shrimp alive any length of time? Ans. Pack in damp seaweed and they will live 24 hours. 2d. Would you fish with this bait with sinker, or make casts, as with a fly? Both modes are used. 3d. Will pickerel take a fly? Yes. 4th. Does the yellow bass take the fly? Takes anything, we believe.

W. D. N., Philadelphia.—We do not think for comfort you ought to shoot 5 drachms from the gun you mention, with 1½ oz. shot. The calibre 10, weighing about 8½ pounds, is not adapted to the charge. The limit would be 4 to 4½ drachms of powder and 1½ oz. shot. With this as an outside charge good shooting can be made.

READER, Brooklyn.—Do silver fish ever turn to goldfish, and do goldfish live peaceably with eels? Ans. Silver and goldfish are two varieties of carp and are often seen in aquaria with eels. Where can I get a good ferret, and about how much I will have to pay for it? Ans. Fred. Mather, Honeoye Falls, will send you one, or inquire at Reiche's, 55 Chatham street, for information. Price, possibly \$1 50.

F. W. K., New York.—For striped bass in Hackensack, fish off the bridges with bamboo trolling rod, 150 feet line at least, float, shrimp, shedder, or minnow bait, small sinker to keep hook under the tide; reel, of course. The bridge at "English Neighborhood," Northern Railroad of N. J., is a favorite stand. Just now the water is thick, and we cannot learn that bass are being taken with hook in either rivers or bay, although this is the proper season.

J. L., Galveston.—1st. Under the law as interpreted at present your yacht should carry as many life preservers as passengers, and a licensed engineer, pilot and captain, even if no passengers are carried for hire. 2d. Liability for injury depends upon many circumstances, and no general opinion will hold. Efforts are being made to procure amendments to the inspection laws that will favor yachts. The present law is almost prohibitory to small yachts and launches.

IDAHO.—An Idaho correspondent speaks of a new and undescribed species of fish that was last summer discovered to inhabit a small lake in the mountains, on a tributary of Payette River, weighing from five to ten pounds, in shape much like a shad, and having a skin and scales of a deep blood-red color. The meat is of a bright yellow color, and delicious to taste. Can you give me any information concerning the fish? Ans. Cannot be identified; description probably incorrect. May be a snicker.

G. N. B., Delphos, Kan.—Think the 100 grains of powder too heavy a charge. To make anything like accurate shooting, the rifle you speak about, like all others, must be carefully wiped out and cleaned after every discharge. From the load you put in you used very fine powder; then total combustion would be possible, but with heavy recoil and stripping of ball with coarser grained powder. It is likely that all of it would not burn. Can recommend Hazard's powder, or the Lafin & Rand. What is the weight of your express ball?

CULEXIFUGE.—Can you not give me a nicer preventive against black flies than the "nasty tar and oil" which you recommend in your "Fishing Tourist," something that is nice for ladies. I don't mind the tar for myself? Ans. Here is a remedy which we have received from North Carolina; we have not tried it, but we doubt its efficacy: Essence oil verbenia, one drachm; cologne spirits, not cologne water, ninety-five per cent; one pint; mix and agitate for twenty-four hours, then add distilled water four ounces, and filter. Bathe the face, neck and hands well, and mosquitoes will not trouble you.

D. McG., Harnsville, Mich.—Between the two American rifles we can see no difference. See scores made by both rifles in FOREST AND STREAM. Know Pape's rifle only from drawings, but believe it to be an excellent arm. Double rifles very little in use in the United States, and would not be likely to be as accurate as single guns. No advantage in them, when for game you could get a Ward Burton magazine arm, with any number of charges in it. The last Creedmoor report can be sent you for 35 cents—cost and postage.

D. W. C., Boston.—Can you give me the fare, or what it would cost from Portland to Rangely, via Farmington and Phillipstown? Ans. About \$12. Can I hire a canoe on Rangely Lake? Ans. Boats on the lake. What kind and size of flies shall I take for the first of August to catch trout? Ans. August dunn, blue professor, ibis, orange fly and cinnamon fly, white miller and coachman. Do you think that the "modern splice" on the tip joint of a trout fly rod better than the brass and ferrule? Ans. Many expert anglers prefer them.

JERSEYITE.—Where can I get a guide book, description, or something of that sort of the different places along the shores of Connecticut, Rhode Island and Massachusetts, with a large map attached, and what is the title of it? Don't know of any that meets your view, but would refer you to Savage's Dictionary of New England, Farmer's New England, Historical Sketches of Suffolk County, Gildner's Index, Apply to Sablin, 84 Nassau street, 2d. Where are the best fishing grounds? Ans. South Oyster Bay, the coast of Rhode Island and Vineyard Sound. 2d. What tackle do we want? Ans. That for striped bass will do for general fishing; you want heavy sinkers, too.

ALEX. C.—Is the name "Ephemera," frequently referred to in Norris, "American Angler's Book," the *nom de plume* of an author, or the title of a publication? If the latter, is it in print? Where can it be obtained, and what is the price? 2d. Will the grayling thrive in water of a temperature exceeding 45 to 50 deg. Fahrenheit? Ans. Ephemera is the *nom de plume* of a writer who contributed largely to *Bell's Life*, in London, twenty-five years ago. His "Hand Book of Angling" and subsequently his "Book of the Salmon," published by Longman, Brown, Green & Longman, Paternoster row, London, 1850, if to be had in this country, will most likely be of Scribner & Co. If not, they may procure it. Can't tell the price. 2d. Grayling will thrive in any water suitable for trout; perhaps in water of rather higher temperature. Young trout require colder water than old and large trout. The latter will be in good condition where it is as high as 70 degrees.

F. L. M., Philadelphia.—What would be the expense of a trip to Neepigon Bay, and can board be had there for a couple of young men who are accustomed to roughing it, but cannot take a camping outfit? Can I find any shelter near the lake without going up the river? Ans. About thirty dollars (ample) to Toronto and return, and thirty-five from Red Rock and return to Toronto. A good boarding house kept in comfortable style by Robert Crawford at foot of the river. No houses or shelter up stream for forty-five miles. Board about a dollar a day. Incidentals of trip ten dollars.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY,
FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS,
AND THE INCUICATION IN MEN AND WOMEN OF A HEALTHY INTEREST
IN OUT DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company,

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,
[Post Office Box 2832.]
and 135 SOUTH THIRD STREET, PHILADELPHIA.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty per cent. for five copies and upwards. Any person
sending us two subscriptions and Ten Dollars will receive a copy of
Hallock's "Fishing Tourist," postage free.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch. 25
cents per line. Advertisements on outside page, 40 cents per line. Reading
notices, 50 cents per line. Advertisements in double column 25 per cent.
extra. Where advertisements are inserted over 1 month, a discount of
10 per cent. will be made; over three months, 20 per cent; over six
months, 30 per cent.

NEW YORK, THURSDAY, JUNE 25, 1874.

To Correspondents.

All communications whatever, whether relating to business or literary
correspondence, must be addressed to THE FOREST AND STREAM PUB-
LISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with
real name, as a guaranty of good faith. Names will not be published if
objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited.
We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief
notes of their movements and transactions, as it is the aim of this paper
to become a medium of useful and reliable information between gentle-
men sportsmen from one end of the country to the other; and they will
find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the
patronage and countenance of that portion of the community whose re-
fined intelligence enables them to properly appreciate and enjoy all that
is beautiful in Nature. It will pander to no depraved tastes, nor pervert
the legitimate sports of land and water to those base uses which always
tend to make them unpopular with the virtuous and good. No advertise-
ment or business notice of an immoral character will be received on any
terms; and nothing will be admitted to any department of the paper that
may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if
money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Managing Editor.

WILLIAM C. HARRIS, Business Manager.

TO THE PUBLIC.

EDWARD MOORE, who was formerly connected with the FOREST AND
STREAM as canvassing agent, is no longer in the employ of this Company,
his connection having ceased on the first day of May last.

ENDEAVORS TO PROPAGATE AMERI-
CAN GAME BIRDS IN ENGLAND.

SOME six weeks ago we informed our readers that
Richard Valentine, Esq., of Janesville, Wisconsin,
had requested us to mention to him the names of certain
gentlemen in England to whom he should send the eggs of
the pinnated grouse.

Understanding that the Prince of Wales had expressed
the very laudable desire of trying the experiment of prop-
agating American game birds, we advised Mr. Valentine
to send to the Prince a certain number of eggs, and to
make at least two other consignments. The two gentle-
men named by us were Frank Buckland, Esq., of Land
and Water, and Lloyd Price, Esq., of Balla, Wales. We
proffered our services to Mr. Valentine to aid quick trans-
portation of the eggs, and on the 18th of last month
some fifty were sent to the Prince of Wales from Janes-
ville. Arriving in New York on the 21st, they were for-
warded on the 22d per Atlas to Liverpool, consigned to
Sandringham, the country residence of the Prince.

Under date of the 26th of May we received a letter from
Francis Knollys, Esq., the Private Secretary of the Prince,
which, in reply to a communication of ours addressed to

the Prince, informed us that "His Royal Highness thanked
Mr. Valentine for the kind offer of sending some American
grouse eggs, and would accept them, providing Mr. Valen-
tine would be good enough to put a price on them." From
a gentleman in charge of Sandringham Cottage, King's
Lynn, we have had a letter informing us that the eggs were
safely delivered there on the 8th of this month. The
writer says: "The eggs were immediately placed
under hens by the Head Game-Keeper, and the Prince was
informed of their arrival. His Royal Highness had re-
ceived before this the intimation of the sending of the
eggs, as Mr. Knollys wrote us to take great care of them.
I hope the result may be successful. I retain your letter
of advice, and will write you again."

We have every reason to believe that the eggs arrived in
good order, as Mr. Francklyn, of the Cunard Line, was
good enough to have them placed in charge of the purser
of the Atlas, and at Liverpool they were forwarded with
the utmost dispatch. As to the condition of the eggs, Mr.
Valentine used every precaution in the selection. The
freshest eggs from new nests were taken, and when over
six eggs were found in a nest all of them were allowed to
remain, the eggs from the nests containing not over six
alone having been taken. The box was carefully made,
and padded outside, so as to prevent any jar. We must
believe, then, that eggs never were sent on a long voyage
with greater precaution and celerity, and as the Prince of
Wales seems to have been interested in the matter, the re-
sult of the experiment, we believe, will be successful as to
the hatching. Whether the birds will live and thrive,
time alone will determine. The eggs for Messrs. Buckland
and Price, Mr. Valentine writes us, unfortunately will not
be coming this year. After having collected a certain
quantity of eggs an accident occurred, and though other
eggs might have been had, Mr. Valentine thought it better
to put off gathering them until next year, when he will
certainly forward the eggs to these gentlemen. We think
sportsmen on both sides of the water should be grateful to
Mr. Valentine for the trouble he has taken in their behalf,
and we have to thank Jackson Gillbanks, Esq., of Carlisle,
England, for a great deal of attention paid to the most in-
teresting subject of introducing our American game birds
into England.

AN OLLA OF SQUID.

"YOUR occupation is gone," said to us, quite enig-
matically, a leading fish dealer in Fulton Market.
"How gone?" we asked.

"Why, you see after Colonel DeVoe, our market super-
intendent, who has made it an imperative duty to cook and
eat every kind of fish that turns up in the market, you might
perhaps have come in as second taster, but now your occupa-
tion is gone. Squids are off the market. There is, in fact,
a corner in squids. There came to market this morning a
Spanish restaurant keeper, Martinez by name, who made a
clean sweep of everything in the squid line."

Now to have imposed on ourselves the rôle of Curtius,
to have plunged headlong into a gulf of squid, to have of-
fered ourselves up as a gustatory sacrifice to science, and
to find out that there was nothing the least heroic about it,
was really too bad.

"What, bought them all?" we inquired.

"Every one of them, and has contracted for all I can get.
My buyer, it seems, had read FOREST AND STREAM, and
became aware through its columns that squid were found
in our waters, but were looked upon with contempt by our
own people. Those squid will be served up to-day in
style."

"His address; his address?" we asked, and we added sol-
emnly, "we will try squid once more, although our first
experience with the cephalopod was not satisfactory."

Towards one o'clock we sought Martinez, of Pearl street,
and a Spanish waiter, with terrific whiskers and moustache,
in the purest Gothic asked us "what we would have?"
Now a notion came into our head to ask for an olla of poly-
pus, but we only feebly muttered "Some stewed squid."
We were not understood. Remembering how Hogarth
stood at Calais, ignorant of French, in search of the good
inn called the Silver Lion, and how he assumed the appear-
ance of the noble animal, standing rampant, with a shilling
on his tongue, we flung our hands wreathingly around our
head, as if to imitate the squirming of the pretty decapod.
The waiter, who certainly had never read Victor Hugo,
had no power of interpreting pantomime, and stood aghast.
At last we seized a pencil, and on the back of a bill of fare
drew off a squid in all its flaring glory. The man could
read pictures (most primitive people can), and he forth-
with smiled and clapped his hands, and rolled out grandilo-
quently these impressive words:—"Calinares con su tinto."
"Tinto!" we repeated to ourselves, that means ink. We
were polyglot enough for that. Was that waiter going to
serve us with a bottle of Thaddeus David's best copying
ink, warranted as indestructible. Furbishing up our Span-
ish—as rusty as Don Caesar de Bazan's cloak—we said,
"Si tinto manyana." The latter word, we believe, is ad-
missible at any time in Spanish conversation.

Just then the host came in person, and in English ar-
ranged things comfortably for us. We had not long to
wait. In a trice the dish was brought, a collection of
squids all basking calmly on a rock of toast. Was it good?
It was admirable, delicious, superb! It was a dream of
the *café de Paris* of twenty years ago, when great Thack-
eray dined there at one table, and the curious Doctor Veron
at another. *Imaginez vous* (no one can pretend to describe
a perfect dish in English without starting it off in French)

something that tasted as delicate as the combs and wattles
of cocks, or of sweet breads, with a reminiscence of the
flavor of soft crab. All notions of the ugliness of the
thing were set aside. It had changed its appearance, and
had put on the guise of an ichthyological carrot. There
was the round taper body like the root of the succulent
vegetable, and the tentacles formed the leafy portions.
How was it cooked? That is a mystery. There was a rich
brown sepia looking sauce, and there was a *soupeon* of gar-
lick, as gentle in its perfume as that shed by a violet. In
fine, he ate up every atom of it, and washed it down with
a bumper of excellent Catalonian wine.

We retract, we wish to recall, unequivocally, every and
anything we may have said against squid. In our barbar-
ism we were at fault. We did not know how to cook it.
All the authorities in the London *Field* were correct in re-
gard to the edible excellence of the octopus. Mr. Marti-
nez told us that in Spain the squid was considered a luxury,
and that it was put up in oil like sardines. "In cooking
it," said the host, "you must preserve the ink sack. It is
the ink that imparts the beautiful color and the delicate
aroma to *calinares con su tinto*."

PROTECTION OF GAME.

WE call particular attention to the circular issued by
the President of the New York Association for the
Protection of Game, addressed to all leading sportsmen's
clubs in the country. Associations throughout the Union,
thinking favorably of the plan suggested, are requested to
communicate with Royal Phelps, Esq., of New York, as
early as possible. We have before this given considerable
space to the measures embraced in the report of the Com-
mittee, on the expediency of having co-operative game
laws, and we trust that this most important subject, to wit,
an uniform law governing the close seasons, within certain
geographical limits, will meet with the approval of all
sportsmen. The main object of the circular letter is to in-
vite a thorough discussion of the question, and to have con-
vened a National Convention composed of sportsmen, fish
cultivists, naturalists and members of acclimating societies
who will urge legislation to adopt co-operative game laws:

[CIRCULAR ADDRESSED TO SPORTSMEN'S ASSOCIATIONS, &c.]

NEW YORK, June, 1874.

SIR.—At a recent monthly meeting of the New York Association for
the Protection of Game, an unincorporated society in this city which has
for its objects the enforcement of the laws passed for the protection of
Fish and Game and the promotion of a healthy public opinion in relation
thereto, the enclosed Report and set of Resolutions were presented by a
Committee, to whom the matter had been referred at a previous meeting,
and were unanimously adopted by the Association and were referred to
the Executive Committee thereof with power.

Pursuant to these resolutions the undersigned Committee would re-
spectfully submit the subject matter therein contained to you and to your
Association for consideration, and should you think favorably of the plan
therein suggested, we beg that you will forward at your convenience a
formal notification of the fact and also inform us at what time and place
you would prefer the Convention therein called for to be held.

If acceptable we would suggest the first of November, 1874, as the time
and the City of New York as the place, in our judgment the most con-
venient.

Please address your answer to Royal Phelps, President, &c., 45 and 47
Exchange Place, New York.

Yours respectfully,

ROYAL PHELPS, President;	Executive Com- mittee of N. Y. Association for the Protection of Game.
ROBERT B. ROOSEVELT, Vice-Pres't.;	
W. J. HAYES, Secretary;	
CHAS. E. WHITEHEAD, Counsel;	
G. H. GAUTIER, CLINTON GILBERT, D. H. HAIGHT,	

CO-OPERATIVE GAME LAWS.

The New York Society for the Protection of Game held its last monthly
meeting of the season at the residence of Clinton Gilbert, Esq., on Mon-
day evening, May 11th, Royal Phelps, Esq., in the chair. Among other
business, the Committee to which had been referred the resolutions
offered by Mr. Charles Hallock in reference to a uniformity of the game
laws, submitted the following report:—

That on the examination of this subject they note the varying laws that
govern the protection of game, and that the variations in the legal times
of killing game do not depend upon the periods when the animals have
ceased breeding, or upon the different climates which advance or retard
incubation, as much as they do upon the accidental selection by the legis-
lature of the law of some other State or Territory as a model. In some
instances the breeding season of some fish has been made the open
season. In other circumstances open seasons have been created for song
birds, which should never be allowed to be killed, as for instance the
brown thrush, in section 10 of the law of our own State. But particu-
larly we note the objection that adjoining States in the same latitude, and
affected by the same climate, and stocked by the same kinds of game,
have different seasons in which they may be taken. The injury done by
this is manifest. It not only imperils the existence of the bird in the
State where it is adequately protected, but it renders nugatory to a large
degree, the proper law in the adjacent State, because most of these laws
are enforced by prosecuting the vendors of the game, and if game killed
according to law in one State is sold in another State where it is illegal,
the vendor can plead that the game was killed in an adjoining State
where the killing was lawful, and thus not only escape himself, but render
convictions under the law so uncertain that few will undertake the risks
of prosecuting. It oftentimes occurs that the breeding place of some
game may be in one State, while the game in the autumn moves to other
grounds, as in the case of woodcock, and a great temptation is thrown in
the way of those who live near the breeding place, and know that in a
few days the birds will move off where they will be killed, and they not
allowed to participate in the chase.

The reasons seem even stronger when applied to fish in rivers which
run through several States, as, for instance, the Connecticut, which is
liable to be fished by the citizens of four different States, any one of
which could prevent by their action the enjoyment of the fisheries by any
of the others.

There are certain zones of climate where the birth and maturity of
game are so nearly simultaneous that the same law could govern in all.
Take, for instance, the quail in Connecticut, New York, New Jersey,
Delaware, Maryland, Pennsylvania, Ohio, Illinois, Indiana, Michigan,
Iowa, Wisconsin and Minnesota. These birds are a staple game bird of
great market value and field pleasure.

Their incubating season may vary between Central New York and
Maryland about two weeks, and in either place will be advanced or re-
tarded that much of time by the character of the season. In none of
these places, however, do any laws propose to open the season at the
precise day when the birds are grown. A reasonable margin of time is
made, extending from October 1st to January 1st. In our own State the
open season is from October 20th to January 1st. These States, on this
subject, had their laws been uniform as to times, would be perpetually
aiding each other; now they are the cause of stumbling and uncertainty.
Another matter which is essential to a complete system of game laws is
to have as many kinds of game as possible condensed into the same close
season. Each State has not only varying times to commence shooting
the same game, but also varying times to commence shooting the differ-
ent varieties of game. Thus in our own State the shooting season for
woodcock begins July 2d; for quail, the 20th of October; for partridge

Sporting News from Abroad.

THE DERBY CARNIVAL.

[From our Special Correspondent.]

MY gun it is cleaned and beeswaxed down the seams, and it will remain in *statu quo* until the glorious 12th of August. My old black-and-tan setter, who has led the team of young ones in their breaking all the spring, is amusing himself by snapping at blue-bottles in the yard, and he knows as well as I do what a long time he will have to wait till the breechloaders crack and the feathers fly. It is very hot, and my "Negretti and Zambia" tells me that iced moët ought to be somewhere handy. The men sport puggarees in Indian fashion and round straw hats, and the women are festooned in the most graceful of gauze and muslin. Shooting is at a discount, and it is impossible to get up more energy than is required for uncorking the soda water bottles.

But to-day is a season of great rejoicing to sporting men, if not to sportsmen, for the spectators are countless on the Epsom downs and the bets are numberless, which one short anxious moment has decided.

George Frederick, who, a week ago, was a rank outsider and almost laughed at, has just pulled off for his lucky owner a prize, which is coveted by the noblest of our aristocracy, and which men of the highest social position have risked life and fortune to gain. I have scarcely need to tell you who has won, for, in all probability, almost before the white cloud of carrier pigeons had left the horizon, the electric current had flashed the news to the uttermost corners of the world, and money was fast changing hands in New York, and India, and Australia; but such is the case, and the problem of a twelve month has been decided in a few minutes. 'Tis a problem that many have attempted to solve and found a veritable "Ass's Bridge." Of course there are every year hundreds of turf prophets who will sell you "a good thing" for eighteen pence in postage stamps, and a douceur from your winnings. It is really marvellous how these "parasites on the hull of the turf" thrive so amazingly, especially when we know that the well established racing papers, such as the *Field* and *Old Bel*, without pretending to Cassandra's talents, give the best advice on the subject which it is possible to obtain. The sporting correspondents of these papers are in the best position to get information, and they devote all their time and ability to studying the chances, and I would infinitely sooner risk my money according to their judgment than go to a miserable impostor, who sends a different horse to each of his victims and then calls on the fortunate one for a bonus, and ends by selling him another "barmecide." It is the old story over again of the Quack who, when asked by the Doctor how it was that he could keep a brougham whilst the professional man had to walk, replied triumphantly, that in every ten of the human race nine were fools, and he secured the nine whilst the one wise man went to the Doctor. "Prospero," the *Land and Water* correspondent, was very discriminate, as he actually selected the two first horses, but this feat was not equalled by any other paper.

Amongst the multitudes that throng the Epsom downs there are many thousands who care very little for racing or betting. They go to the Derby as they go to the University boat race, solely for amusement and an enjoyable holiday. To them the luncheon is the great feature of the day's entertainment. What matters it to them whether the favorite or an outsider wins the day, if they can unpack a well filled Fortnum & Mason basket, and let loose "the sparkling" from silver tinselled and green labelled bottles. As soon as the race is over these sybarites spread their tableclothes on the green sward, and fall too at pigeon pie and chablis, whilst the heavy plungers are cursing their bad luck and desperately laying out their last "five" on the next event on the card. All the tag-rag and bob-tail of our vast metropolis take their part in this wild carnival. There are tumblers and acrobats, rope dancers and negro songsters in scores. There are men that eat fire with extraordinary gusto, "Professors" that show the highest excellence of pugilistic art, athletes that have paving stones crushed on their stomach by blows of sledge-hammers, Punch and Judy shows, three thimble men, and beggars, mountebanks, and scoundrels of every degree. There are elegant landaus whose fair occupants drink champagne, and rouge too vividly and laugh too loudly. There is my lady's carriage where the aristocratic beauties lounge languidly and affectedly in a circle of equally languid and affected swells of the first water. Then our friend the costermonger's donkey cart painted a spruce red, and with a very sporting air all round it. There are four-in-hand coaches, well horsed, well handled, and well leathered with a team that can do its fourteen miles an hour without turning a hair, stepping well up to their chins and "flying" when the white thong whistles down their flanks, and reminds them of their duty.

It is a vast fair. A festival in honor of the goddess Voluptas, or a modern celebration of the Isthmian games. The first Derby is the thing which a man remembers to his dying day. There is no race in the world like it. The Oaks, the Two Thousand Guineas, and even the great St. Leger sink into painful insignificance when compared with it. Perhaps the Ascot course is more remarkable for its fashionable habitues and elegance of its toilets, but if it be desired to see the English people enjoying itself in every variety of manner, by all means go to Epsom.

But the race itself. A race where no expense, no talent,

with the Montreal Rifle Club the Secretary of the Club will be delighted to hear from him, and will, I have no doubt, be quite willing to accept any modification of the suggestions above Colonel W. may care to make. The Secretary's address is, J. E., care of "Royal," box 342 Post Office, Montreal.

OBITUARY.—The very sad death of Mr. Francis Butler, on Tuesday the 16th of June, from hydrophobia, has caused a most painful sensation. The detail of the case reduced to its simplest form is about as follows:—About six weeks ago a Spitz dog, a house pet, was brought by its owner to Mr. Butler, at Peck Slip, to be professionally treated. The owner of the Spitz said the dog was sick, and moped, and refused food. Mr. Butler determined to give the animal medicine, and in endeavoring to force some fluid down the creature's throat, the dog bit him badly in the thumb. In taking the dog home a day afterwards, to Mr. Butler's house in Brooklyn, the animal is said to have bitten him again. On Monday, the 15th, while at breakfast, while taking a cup of tea, the unfortunate man found he could not swallow it, and paroxysms coming on, on Tuesday Mr. Butler died. Mr. Butler was buried on Sunday last. The unfortunate man was well known both in this city and in the State for a great many excellent qualities. Besides being a dog fancier and a florist, he had a great deal of information in regard to natural history, and was a linguist and author, and a poet of some merit. In his profession of selling dogs he was always esteemed as especially trustworthy and honest. Mr. Butler, strange to say, was skeptical as to hydrophobia, and did not believe in it. In summing up this sad accident and stripping it of a great deal of the verbiage which usually accompanies such cases, we see undue prominence has been given to what we think is a very absurd theory, that hydrophobia may remain latent for years in the system and then develop itself. Such theory rests on no single fact. The action of the poison rarely remains in abeyance for more than three months at the outside. We write this because we have received several letters in regard to this subject, when, perhaps, untold agony may have been endured by persons who have been bitten by dogs. The chances are many millions to one that the dog that may have bitten any one is mad, and it is to aggravate one's terrors to think that madness in the individual thus bitten may be threatening at any time. We again repeat what we have before advised. If bitten by a dog, believed to be mad, use the heroic treatment. Incise deeply, put on fumial nitric acid and poultice, in order to keep the wound open and aid the discharge. We have not seen ligatures used as in cases of snake poisoning. We should advise such ligatures to be immediately employed above the bite, even before the physician is sent for.

DEATH OF MRS. AUDUBON.—There died at Kellyville, Kentucky on Thursday last, at the advanced age of eighty-eight, the wife of the American ornithologist, J. J. Audubon. Mrs. Audubon was a woman of wonderful attainments, and devoted to her husband's noble calling, assisted him in his labors, and helped him to gain his triumphs. In his company she made frequent visits to the wildest regions of the United States, and was an example of a woman's love and courage. For many years past, after Audubon's death, she has lived in peace and quiet with her relatives in Louisville.

MILITARY RECEPTION.—The 1st Battalion of Massachusetts Light Artillery, Maj. D. H. Follett commanding, arrive here on the 25th, and will march up Broadway about 10 A. M. to the Grand Central Hotel, where they will be quartered. They will give an exhibition drill at Tompkins Square the next forenoon, for which invitations have been extended to Mayor Havemeyer, and Maj. Gen. Shaler. On the evening of the 25th Maj. Follett will give a reception to the officers of the 22d Regiment, all the prominent officers of the 1st Division, and the Press, at the Grand Central. The battalion, which is composed of two batteries of six guns each, is one of the most popular organizations in Boston, where its commander is well known as one of the leading citizens, formerly proprietor of the Globe Theatre and an enthusiastic yachtsman. The battalion returns home on the 27th.

SLAUGHTERING WOODCOCK.—Pot hunters from Washington infest all the marshes below this city, play sad havoc among the young woodcock, and send their game in large quantities, packed in ice, by sail-boats to that city. The shooting of the woodcock now is contrary to law, the penalty being a heavy fine, half of which goes to the informer.—*Alexandria Gazette*, 13th.

If the Sportsmen's Club of Washington feel unable to bear the expense of prosecuting these violators of law and common sense, let them apply to outsiders, and we will guarantee that from subscribers of the *FOREST AND STREAM* alone they will easily obtain what is needed. Courage and energetic action, a few arrests with full penalties, will dismay the pot hunters.

—At a meeting of the Great Falls Fishing Club, held last Monday evening, the following officers were re-elected for the ensuing term:—Charles Whelpley, President; Conrad Eber, Vice-President; Theodore Freiburg, Secretary, and Samuel Brereton, Treasurer.

—Persons leaving the city for the summer can have the *FOREST AND STREAM* mailed to their address for two months for one dollar.

—We shall print in our next, an extended notice of the Morris County Sportsman's Club of New Jersey, organized on the 11th of June just passed, and already numbering sixty members.

the 1st of September; for starlings, the 1st of August. Country people do not carry these dates in their minds, and are led into error; and those seeking to enforce cannot tell whether a sportsman in the earlier months is pursuing legal game, and there is a total absence of a fixed, definite time in the public mind when field sports begin.

The same irregularity in our laws exists in those of the other States. No greater step in advance in these matters could be made than by having a fixed, permanent day when all shooting might begin.

We cannot pass in silence one general omission existing in the laws of all the States. No provision exists protecting the migratory birds that visit us in the spring of the year. English snipe, plover, dowitches, and the many varieties of birds that enliven our beaches, are wholly unprotected by law, and are killed and sold in the markets in April and May in large quantities. When the spring is late, and the birds are delayed in their passage, they are found full of eggs, and sometimes are forced to nest within the State.

These birds should be protected in every State, no matter where they are flying to, for they are the children of our common country, and are gladdening every part of it in their migrations. No rule is so good as the rule that no gun is to be fired at birds or animals in spring or summer. Every reason of health to the eater, of abundance of supply of the article eaten, of justice to the animal when breeding or preparing to breed, plead for the fullest and most comprehensive and uniform laws in these matters, and therefore we submit the following plan and resolution:—

Whereas, The general sentiment of the country is in favor of the creation and immediate adoption of some system which will secure in the different States and in Canada greater uniformity, and consequently greater efficiency in the laws for the protection and preservation of game, and inasmuch as a plan for securing these objects through co-operative legislation of all the States was submitted to the American Fish Culturists' Association, and unanimously endorsed by it last February, and since then by other similar bodies in various parts of the country;

Resolved, That it is expedient and necessary to call a National Convention at the earliest date consistent with a careful and general scrutiny of the scheme; and inasmuch as this body, the New York Society for the Protection of Game, has already discussed it in session and submitted it to legal gentlemen of experience for examination and secured its approval, we do hereby recommend and advise that a circular letter be addressed to each and all sportsmen's clubs, acclimating societies, natural history societies, and fish culturists' associations throughout the country, wherever available, inviting an endorsement of the same, and requesting that a written notification of such endorsement, signed by their respective Presidents and Secretaries, be sent to the Secretary of this Society, to be filed, and that the said letters shall express the choice of location and date of year at which the National Convention shall be held, and if it shall be found upon examination at the end of six months that the favorable responses are sufficiently numerous and widespread to be regarded as representing the wish of the country, then a call shall emanate from this New York Society for the Protection of Game, designating such time and place for the meeting of the Convention as shall appear to be the wish of the majority of the societies responding. All of which is respectfully submitted.

WILLIAM C. BARRETT,
CHAS. E. WHITEHEAD,
CHAS. HALLOCK, } Committee.

May 11th, 1874.

The report was adopted, and referred to the Executive Committee of the Association with power.

OSWEGO CONVENTION.—The New York State Association for the Protection of Game met according to announcement at the Trade Rooms, Doolittle House, on Monday evening.

First Day's Proceedings.—The credentials of delegates, of which some one hundred and eighty were presented, were received. Some delegates were not present, and some clubs failed to use their privilege in sending delegates. Several new clubs were added, and the President, Hon. A. C. Mattoon, opened the meeting with a few appropriate remarks. Considerable discussion ensued relative to altering the by-laws, and the sense of the meeting was then taken as to the choice of place for holding the next annual meeting. An informal ballot showed the following result: Syracuse, 26; Niagara Falls, 17; Geneseo, 17; Buffalo, 12; Watertown, 12; Lockport, 5. The meeting then adjourned to meet on Tuesday evening, after which a collation was extended to the entire delegation by the Leather Stocking Club of Oswego, under whose auspices the convention is being held.

A RIFLE CHALLENGE FROM CANADA.—We publish a challenge emanating from Canadian riflemen. The well known standing of the gentleman who sends the challenge to us for publication is a guarantee that it means business. We have requested E. to address Colonel Gildersleeve, the Secretary of the N. R. A., and have sent copies of original challenge to Colonels Gildersleeve and Wingate. By "A Simultaneous Match" is meant that on a fixed day the Canadians and Americans, at their respective ranges, near Montreal or Quebec, or Creedmoor, shall fire a certain number of shots at certain ranges, agreed on before hand, each side having appointed umpires. During the match scores are telegraphed, and at the conclusion the totals are given. A match of this character, novel with us, would be most exciting. We trust not only the simultaneous, but the regular match will be accepted.

MONTREAL, June 16, 1864.

EDITOR FOREST AND STREAM:—

A couple of old stagers who have not fired a rifle for several years, proposed yesterday that I should endeavor to get up a friendly match with some of the Creedmoor marksmen. I therefore propose for friend Wingate's reflection, a simultaneous match, to be something as follows:

1st. Military weapon, say six to ten men a side, Americans to use Springfield, Remington, or any rifle *bona fide*, in use by their regular troops or volunteers, with open sight, and pull of trigger not less than six pounds; Montreal Rifle Club to use Snyder Enfield's Government issue. Ranges to be not shorter than 200 yards, nor over 600 yards. Say seven shots each at 200 from shoulder, and seven shots at 500, in any position, or five shots each at twenty-five and six hundred yards. Match to be shot some Saturday afternoon, each party to appoint an umpire to keep the score for the other parties, the aggregate score to be telegraphed immediately on conclusion of firing.

2d. If Colonel Wingate would prefer it I could bring out a team of, say six small bore men, to shoot at 800, 900 and 1,000 yards, ten or fifteen shots each distance, any rifles coming within N. R. A. rules. Montrealers use the Metford. My only object in proposing a match of this kind is to endeavor to get the shooting men of both countries to know a little more of each other and to have an afternoon's amusement. If a match is made with the military weapons it will be a pretty fair test of their quality, as the men on both sides will probably know how to shoot them. My team would consist of some of the old hands who have long ago deserted the rifle, but who have a hankering after their old ally.

The annual matches of the Province of Quebec Rifle Association will take place early in August, when several thousand dollars will be given in cash prizes. We will only be too delighted to welcome any of our American friends who may care to shoot, and as almost all our matches are open, they can rely on plenty of fun if they come. If Colonel Wingate would like to get up a match

no experience is spared to bring together the fastest thoroughbreds of the year. At last the arduous duties of the trainer are at an end, and the colt, whose pedigree dates back to the Godolphin Arabian, strips clean and muscular with a coat like satin, and blood and breeding in every limb. He has cost his noble owner thousands since he left his high bred dam and was bought at Mr. Blenkiron's sale, and his pride and courage testify the "blue" nature of the hot fluid which courses down his veins. Lightly and easily leaps the jockey to the saddle, and with hands as delicate as a lady's he soothes the fiery spirit and excitement of his charge, whilst the owner whispers to him the final orders. "They are off," shouts the crowd; but no, it was a false alarm, and the starter's flag is still waving. Now it is done. With a rush and a leap the thoroughbreds to the fore, and the mad, wild gallop for the goal has begun. Through my binocular I see the jockey's colors change like the painted glass in kaleidoscope. Now in front flashes out the far famed yellow and black, and as the bright and ever varying batch of jackets comes forth against the dark crowd, ever and anon I mark the cerise and white which has won many and many a hard fought fight. With startling speed Volturmo makes the running, whilst behind him come Trent, Whitehall, and Selsea Bill, whilst George Frederick and Aquilo close up the rear. Half way up the hill Tipster heads the first horse and Rostrevor is third, but as they near the prize, Eccossais, the quondam favorite, the modern "Sunshine" passes them. Tattenham corner is neared, and as they turn into the straight, the wind is taken out of the sails of Tipster; King of Tyne is pumped out and Volturmo, though he struggles gamely, is wrecked in port. With a rush comes George Frederick to the front, and Coronne de Fer, Lecolius and Atlantic do their best to follow him. The crowd are shouting madly, the ladies wave handkerchiefs and feel faint with excitement, the ring cheers, and one has but to glance down the long line of white faces to see how the "furor" of the moment has seized on every one irrespective of rank or age. But the suspense endureth not long, for the bright chestnut responds gaily to the magic touch of the spur, and as the far famed Blinkbonny left her horses on that memorable day, which was a precursor to her achievements in the Oaks, so in his slashing stride comes on the son of Marsyas and the brilliant scarlet and black of Mr. Cartwright passes the judge's chair two lengths before the rest. A neck alone divides Coronne and de Fer and Atlantic. The Chester Cup hero Leolinus is fourth, and the nearest to him are Rostrevor, Trent and Aquilo.

Run in two minutes and forty-six seconds—it was a good race, though the horses were supposed to be moderate and not up to the stamp of Blair Athol, Favonious and Lord Lyon. Custance, his jockey, has won three Derby's, and the race was an excellent one for the bookmakers, who had one and all "smiling volumes." How strange it is that poor George Fordham, who is the most successful jockey of his time, in all other races, never by any chance has been able to win a Derby, though every one says he has a good mount. The betting was, I think, tolerably heavy, and one noble plunger laid out £3,000 that very day on the Oaks, but is worthy of note that when Mr. Henry Chaplin entertained the Jockey Club at his residence a few months ago, not one of them had any money above a five pound note on the Derby. I do not think betting is, however, on the decrease, only men go about it now more systematically than the amateur bookmakers in the guards did, who, when he showed his book to a friend before the race, received it back with this remark: "You must lose £500, but God knows what you may lose."

A curious scene is the return home from the field, very often, for every body is drunk that has to drive, and there is many a bag of flour shot skilfully over many a new coat, and many a fair occupant of a carriage is upset into the mud. After all, perhaps the Frenchman's description of the English Derby beats mine: "Here they come. There they go. Pay me £50."

Shot Gun and Rifle.

JULY IS A CLOSE MONTH FOR GAME.

Details of pigeon shooting and scores of rifle matches, and other interesting matter, should be mailed so as to reach this office on Tuesday morning in each week.

NIAGARA FALLS, June 18, 1874.

EDITOR FOREST AND STREAM:—

A few days ago I sent you a score made by three members of our club. To-day I send you another; 20 wild birds each and the wind was blowing a perfect gale; birds very lively.

L. T. Mooney—1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1—20.

J. M. Whittier—1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1—20.

R. O. Fulton—1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1—20.

R. O. F.

[This is the best score yet. Who can beat it?—Ed.]

WHITE CLOUD, Kansas, June 17, 1874.

EDITOR FOREST AND STREAM:—

Enclosed find score shot here on 11th June, Falls City Club (Nebraska) against White Cloud, six men on a side, 10 birds each, Keokuk rules, 1½ oz. shot, 80 yards boundary, 2 H and T plunger traps, 5 yards apart.

WHITE CLOUD.		FALLS CITY.	
Name.	Total.	Name.	Total.
D. C. Taylor.....	4	C. R. Richards....	6
J. M. Mackoy.....	4	Bel.....	5
John H. Lynds.....	5	G. R. Sommers....	6
A. R. Spalding.....	2	G. Powell.....	4
E. Deitz.....	7	D. P. Brannon.....	5
Sam Maquiklen.....	5	Doc. J. Gibson.....	3
Total.....	27	Total.....	29

A match for pigeons took place between George Delaware and Sam Maquiklen on 17th June for \$50, 10 birds, same rules. Delaware—1 0 1 1 *0 1 1 0 1 0—6 Maquiklen—1 *0 1 1 1 1 0 0 0—6

*Fell dead out bounds. The bet was made that George Delaware could kill more pigeons out of ten than Maquiklen. We want your decision which side wins, or is

it a draw? We are ashamed of our score made in match with Falls City, but the wind was blowing nearly a gale from the traps to the scorer.

J. M. MACKOY, Sec. U. C. S. S.

[Delaware did not kill more pigeons than his opponent, but only an equal number. Bet lost, of course.—Ed.]

PLYMOUTH, Mich., June 15, 1874.

EDITOR FOREST AND STREAM:—

The Audubon Club, of Plymouth, was organized on the 1st of April, 1874. The following is a list of its officers for the year ending April 1st, 1875: President, Martin Kenyon; O. A. Frazer, 1st vice-president; A. Pelham, 2d vice-president; R. Haines, secretary; C. E. Baker, treasurer; W. Wherry, C. M. Sly, F. A. Smith, J. P. Westfall, R. L. Root, executive committee.

The first pigeon tournament conducted by the club came off on Saturday, the 13th of June. All being amateurs, no prizes were contested for—only a test of amateur skill. The contestants shot at 10 single birds each at 21 yards rise, 80 yards fall. The following is the score:—

Martin Kenyon.....	8	W. Wherry.....	8
R. Haines.....	9	A. Durfee.....	9
O. A. Frazer.....	5	C. M. Sly.....	8
A. Pelham.....	9	William Rhead.....	9
H. Whipple.....	8	C. Baker.....	8
W. Burrow.....	3	J. Westfall.....	7
C. Root.....	9	F. Merrill.....	6

NEW YORK, June 5, 1874.

EDITOR FOREST AND STREAM:—

Any hunting story in print ought to be true in every detail, and all unnecessary embellishments should be avoided. I therefore take the liberty to correct "Lehman" about the remarkable rifle shot, of which he gave a description in your last issue. In my younger days I was an officer in the Prussian Fourth Regiment of Cuirassiers, and for a long time stationed in the town of Beulher, belonging to the estate of the princes of Carolath. Being an intimate friend of the son-in-law of the late prince, I visited frequently his castle, and was out hunting in the extensive forests as often as my military duties and an amiable captain would permit. And though I was not present when the shot in question was made, I was informed of all the particulars a few hours later. At that time—about 1840—the finances of the prince had become awfully embarrassed, and he had signed over the revenues of the lordly estate to the "Seehandlung," a financial institution of the Government. The Seehandlung had appointed as director and administrator a Mr. Block, who died about 1845, and he was the gentleman—not the present prince two years ago—who killed with one ball the three deer standing in a triangle not very far apart. If I am not much mistaken, the ball, as stated by "Lehman," glanced off from the shoulder bone of the buck, penetrated the throat of the second deer, and settled finally in the head of the third. The Prussian game laws forbade, and I think forbid still, the killing of does throughout the year unless they are barren since sometime, or disabled by poachers, and the prince kept, therefore, a grudge about this mishap for many years, though Mr. Block was, I may say, his benefactor, for in an astonishing short time he had brought the estate again in a most flourishing condition. That this is the true story I can easily prove now, even in America. The German ambassador in Austria is at present visiting in Westchester county at the residence of his father-in-law. He could, if need be, corroborate my statement. Many years ago I spoke of that strange shot to my American hunting friends, and as these will certainly see my correction in your paper, I will adopt the name which they familiarly gave me, and shall sign myself, Mr. Editor, yours truly.

OLD SMEDY.

CREEDMOOR—SECOND MATCH OF THE AMATEUR RIFLE CLUB.—On Saturday last this event took place. The attendance was a fair one, but not as large as we had hoped to see. Perhaps the undecided character of the weather might have had its influence. If we want to hold our own, even not to be distanced by the Irish team, our rifle-men must be on the ground at every leading match, and learn to shoot at the long ranges. The rifles, *per se*, are all right, and the knowledge of how to hold them straight we have already acquired; but what the members of the N. R. A. want to learn may be described as rather the book part or scientific portion of marksmanship than anything else. The difference of a fraction of a degree in elevation, the variations up or down required in sighting, in sympathy with the lights or shades of the day, which may vary every quarter of an hour, the effects of the winds, which are ever changing, must be noted. It may have been bright and clear yesterday, and the marksman, in his practice, may have made bullseyes at one thousand yards one after another, and having recorded his exact elevations, may be elated with the idea that he will carry all before him. Match-day comes, and he is decidedly off throughout his whole scoring, nowhere in fact, and he recalls with disgust his triumphs of the day before. A careful man learns a lesson by this, and patiently determining to find the reason of his failure, thinks over it, and just as likely as not finds that the error lies in taking one day's shooting with the elevations used as the rule for all days, when the truth is, that all things, within, of course, a certain limited sphere, vary, and that a degree or so too much or too little on the vernier makes a difference between scoring an outer or a centre. Sometimes the simplest mechanical preparations in loading cartridges are conducive of error. Theoretically, the rifleman ought to load his own shells; practically, he rarely does so. A gentleman, an expert, whose very thorough articles on rifle practice have graced our columns, in shooting at an important match two or three weeks ago, though having scored bullseyes innumerable at shorter ranges, at the longest ranges could not even get on. The elevation was right, or if in error, could have been but slight, and his balls ought to have at least made outers; but not one was marked. He neither abused his gun nor the makers, but thought it all over to himself. On going home, for he loads his own shells, he found that the beam of balance on which he weighed his powder had rusted and caught, not giving the full weight of the charge on the scale disc. He had, in fact, at the longest ranges, been shooting with cartridges loaded with from five to ten grains too little powder, and of course every shot at one thousand yards had plumped into the sod before reaching the butts. We give this as an example of what may happen even to the most careful rifle-men.

The conditions of the Amateur match were five shots each, with two sighting shots at 800, 900, and 1,000 yards,

the eight best at the two first ranges to compete at the 1,000 yard. Prize, the handsome new badge of the A. R. C. There were nineteen entries, and at the 800 yard range the following scores were made:

AT 800 YARDS.

Name.	Arm.	Score.	Total.
H. Fulton.....	Remington sporting....	4 4 4 3 4	19
A. V. Canfield, Jr.....	Remington sporting....	3 4 3 3 4	17
J. S. Conlin.....	Sharp sporting.....	4 2 3 4	16
L. S. Hepburn.....	Remington sporting....	4 4 2 2	16
J. Trageser.....	Sharp sporting.....	4 4 2 3	16
J. T. B. Collins.....	Sharp sporting.....	3 2 3 4	16
J. E. McEwen.....	Remington sporting....	3 3 3 3	15
L. M. Ballard.....	Sharp sporting.....	2 2 3 3	15
General T. S. Dakin.....	Remington sporting....	3 3 0 2	13
George Crouch.....	Sharp sporting.....	3 4 3 0	13
P. C. Sanford.....	Remington sporting....	3 4 0 2	13
A. V. Davis.....	Sharp sporting.....	3 3 2 3	13
L. Backer.....	Remington sporting....	0 4 2 3	12
G. W. Yale.....	Sharp sporting.....	4 2 0 3	12
A. J. Hennion, Jr.....	Sharp sporting.....	4 3 0 2	9
L. Geiger.....	Remington sporting....	2 3 2 0	9
Colonel G. W. Wingate.....	Remington sporting....	0 3 2 0	7
J. L. Price.....	Sharp sporting.....	0 3 0 0	6
A. L. Ford.....	Remington sporting....	2 0 0 2	7

Nineteen, made by Mr. Fulton in a possible twenty, is a very high score, especially as Mr. Fulton was shooting with a gun he was not familiar with. Up to the score of those counting fifteen the shooting was fairly good.

AT 900 YARDS.

Name.	Score.	Total.	Grand Total.
J. Trageser.....	3 3 4 3 3	16	32
J. T. B. Collins.....	3 3 3 3 3	15	30
H. Fulton.....	4 2 2 0 2	10	29
J. S. Conlin.....	4 3 0 2 3	12	28
L. S. Hepburn.....	3 2 2 0 3	10	26
G. W. Gale.....	4 0 3 3 2	12	24
George S. Wingate.....	3 3 3 4 3	16	23
J. E. McEwen.....	0 4 0 0 4	8	23
L. M. Ballard.....	2 0 3 4	9	22
General T. S. Dakin.....	0 0 3 3 3	9	22
George Crouch.....	0 2 2 3 0	7	20
A. V. Davis.....	0 2 2 3 0	7	20
A. V. Canfield.....	0 0 0 2 0	2	19
A. L. Ford.....	2 3 4 0 2	11	18
L. Backer.....	0 2 0 4	6	18
A. J. Hennion, Jr.....	2 0 4 0	6	15
P. C. Sanford.....	0 0 0 0 0	0	13
J. L. Price.....	0 0 0 0 0	3	9
L. Geiger.....	0 0 0 0 0	0	9

The one hundred yards additional now commenced to tell, and Mr. J. Trageser, with a score of 16, now was in the lead, having made 32 at the two ranges. The contest then became narrowed down to the eight following gentlemen:

AT 1,000 YARDS.

Name.	Score.	Total.	Grand Total.
J. S. Conlin.....	4 3 3 4 3	17	45
H. Fulton.....	3 4 3 0 3	13	42
L. S. Hepburn.....	2 2 4 3 4	15	41
J. Trageser.....	3 2 0 0 2	7	39
J. T. B. Collins.....	0 0 3 0 2	3	33
George S. Wingate.....	4 0 3 0 2	9	32
G. W. Yale.....	0 3 3 0 0	6	30
J. E. McEwen.....	0 0 0 0 0	0	23

RECAPITULATION.

Name.	800 yds.	900 yds.	1,000 yds.	Total.
J. S. Conlin.....	16	12	17	45
H. Fulton.....	19	10	13	42
L. S. Hepburn.....	16	10	15	41
J. Trageser.....	16	16	7	39
J. T. B. Collins.....	15	15	3	33
G. W. Wingate.....	7	16	9	32
G. W. Yale.....	12	12	6	30
J. E. McEwen.....	15	8	0	23

Though the shooting was not brilliant, it was still quite satisfactory. Mr. Conlin's score of 17 at 1,000 yards is a very handsome one, and to him was awarded the prize. No gentleman on the ground deserved it more fully. We would most respectfully urge on the N. R. A. the necessity of having good glasses on the range. The single one in use, on a delapidated tripod, a ramshackle concern at best, wants mending sadly. Some half dozen glasses, which would cost at least \$25 to \$30 each, would not be a terrible outlay, and would add much to the comfort of the marks-men. Glasses are necessary adjuncts to the system of ranges, otherwise markers cannot be well controlled. It was proved at this match that shots were made which escaped the notice of the markers. Perhaps it would be economical after all to hire for every match the regular soldiers from Willett's post, who could be depended upon. Many very natural expressions of doubt as to the exactness of the scoring might be prevented by having a sufficiency of glasses and by employing competent markers. Perhaps in time the men now serving the range will improve; but in the mean time the present condition of want of accuracy in marking must be singularly prone to shake the confidence of the rifle-men.

The members of the Seventh Regiment held on Saturday their accustomed shell contest, five hundred yards. As usual, it was an exciting match, with a dash of uncertainty about it. Mr. McWilliams stood fair to win with the very good score of 16, when, in the coolest way, Mr. J. P. M. Richards, who came down quietly by the last train for Creedmoor, neatly made 17 with his Sharp's military, and secured the much coveted brass shells with the gold clasp. The scores of the four best in the nine competing were as follows:

Name.	Score.	Total.
Comp. G. Lieut. J. P. M. Richards..	3 4 3 4 3	17
Comp. A. Corpl McWilliams.....	3 4 4 3 2	16
Comp. H. Corpl Price.....	2 2 4 3 2	13
Comp. G. Corpl Gardner.....	3 0 2 0 3	8

The Amateur Rifle Club will meet again on Saturday next, at 11 A. M., at Creedmoor, to shoot for the badge. In the afternoon the *Turf, Field and Farm* badge is also to be shot for—the match to begin at 3 P. M.

—On Thursday last the 22d Regiment N. G., proceeded to Creedmoor under the command of Colonel Porter. Firing commenced early, there being fully 300 competitors. Five sighting shots at 200 yards were allowed, and the five subsequent shots were scored. In the afternoon those who were qualified tried the 500 yards range. The wind had been high all day, but towards sunset subsided. The fol-

lowing are the twenty leading shots; a most commendable score:

Name.	200 Yds. Total	500 Yds. Total.	Grand Total
Pvt. Backer, Co. F....	3 3 2 3 3-14	3 4 4 3 4	18 32

Pvt. Harding, Co. B....	2 3 2 3 3-13	0 3 2 2 3	10 23

On Monday, June 22d, the Sixty-ninth Regiment were at Creedmoor, some 200 members of the National Guard shooting. The following are among the best scores. We have only room to give the leading twelve. The skill evinced was in the highest degree creditable. We only hope on match days the same ability will be shown:—

Name	200 yds. Total	500 yds. Total.	Grand Total.
Sgt. Harkins, Co. E....	3 3 4 2 4 15	2 4 3 3 3	16 31

TABLE OF ELEVATIONS FOR THE REMINGTON CHALLENGE LONG RANGE BREECH-LOADING RIFLES.—Thirty-four inch barrel, 44-100 calibre, weight ten pounds, 90 grains powder, 530 grains hardened swaged and patched bullet. 100 yards, 10 min.; 200 yards, 20 min.; 300 yards, 32 min.; 400 yards, 45 min.; 500 yards, 58 min.; 600 yards, 1 deg. 13 min.; 700 yards, 1 deg. 28 min.; 800 yards, 1 deg. 45 min.; 900 yards, 2 deg.; 1,000 yards, 2 deg. 17 min. As these elevations were obtained from a particular rifle, and as they vary somewhat in consequence of the difference in crook of stock and taper of barrel, it will be necessary to find out by actual shooting at one range if your rifle agrees with above table; if not, subtract from or add to, as the case may be, the actual variation found. For example, if at 500 yards it is found that 55 is the correct elevation, subtract 3 from all the elevations; if 1 deg. 5 min., add 7 min. to all elevations.

ELEVATION FOR SHARP'S IMPROVED LONG RANGE TARGET RIFLES.—The elevation of the rear aperture sight for each distance is obtained by moving the screw until the scale indicates the number of hundredths of an inch, given in the annexed table.

The main scale is graduated in equal decimals of 10ths and 20ths of an inch. The slide has a short vernier scale which will enable any one to count hundredths of an inch. The bottom line of this scale is that used in measuring the elevations, the others serve to enable the shooter to move the slide 1-100 of an inch at a time when necessary. The front sight or wind gauge is graduated in 40ths of an inch, equal to about two inches to every 100 yards. The following is the scale of elevations: For 200 yards, .11; 300 yards, .25; 400 yards, .40; 500 yards, .57; 600 yards, .74; 700 yards, .92; 800 yards, 1.10; 900 yards, 1.30; 1,000 yards, 1.51; 1,100 yards, 1.73.

THE AMATEUR RIFLE CLUB.—The third match for the Long Range Badge of the Amateur Rifle Club will be held at Creedmoor, Saturday, June 27th, at 11 A. M. Open only to members of the Amateur Rifle Club, with any rifle not over ten pounds in weight, the trigger not less than three pounds test pull; telescope sights excluded; distance 800, 900 and 1,000 yards; all the club to shoot at 800 and 900 yards, and the eight highest at 900 to shoot at 1,000 yards. Position, any (without artificial rest); rounds, five at each distance, with privilege of two sighting shots; entrance fee, fifty cents.

Practice for intending competitors after the hour named for the match is forbidden upon penalty of disqualification for that match. Entries to be made on the ground, or at the secretary's office.

—Company D of the Twelfth Regiment N. G. S. N. Y. under date of June 14th, have sent out a challenge to the members of any other company in the whole national guard, excepting the companies of their own regiment, to contest with them at Creedmoor for supremacy with the rifle. Distance proposed, 200 yards; arms, Remington military; rounds, seven, two sighting shots; time, between 22d of June and August 1; prize to be the right for the winners to entitle themselves "The Champion Rifle Company First Division N. G. S. N. Y." Rules to be those adopted by the N. R. A. We think this to be an admirable move, and hope to see the challenge accepted. Captain H. B. Smith, 1,304 Broadway, will represent Company D, and will receive written communications in regard to the acceptance of the challenge.

—In the *Knapsack*, a regimental paper published at Hartford, Conn., we understand that the question is being agitated of having a rifle range. The American Union Rifle Association of Connecticut, which takes prominence in the State, is composed of the following rifle clubs: The Franklin, of Hartford; Winchester, of New Haven; Bridgeport, of Bridgeport; American, of Meriden, and Independent, of New Britain. It is proposed to hold a grand match somewhere in the State in August.

—The programme of the English N. R. A. is now published, and one is amazed at the quantity of matches on the tapis: Some days have, like the 15th of July, as many as

eighteen matches to be shot for. On the 16th of July the Echo shield contest takes place. Some day, we trust, perhaps it will be next year, to publish rifle "fixtures" for the year.

—On Saturday the Canadian Wimbledon team sailed per Circassia for England, Lieutenant Colonel Gilmour in command. The composition of the team will be found in a former issue.

—Here is a wonderful score, hard to beat. Think of it gentlemen of the N. R. A., but do not despair. Lieutenant J. McIntyre, of Candross, won the Lanark Prize in Scotland this month at the any rifle match, 900 yards, fifteen rounds, with this neat score:

Lieut. J. McIntyre, Candross.....44444444444433 58

—A Baltimore correspondent writes June 13th: I called on the old-established and popular gun store of Alexander McComus, in Calvert street, where I saw the most elaborately-finished gun that I remember to have met with. It was an Algerine make, ebony stock, profusely inlaid with silver wire. It was a flint lock, the barrel embossed with silver: bands of the same material, carved and chased. But what gives it a greater interest with the "quid nuncs" is the inscription inlaid with silver on the stock in Arabic or Turkish, of which the translation has been given me by a German: "Swiftly they go and disappear in the distance; the strong and valiant men, the lords of the valleys in the land of Fez. In the year 1289."

NEW HAVEN, June 19th, 1874.

EDITOR FOREST AND STREAM:—Enclosed please find a score of a shooting match between some gentlemen of the New Haven Shooting Club, which took place in this city to-day. The match was for sweepstakes and three prizes. A dispute arose as to whether the first two contestants, who killed all of their birds, were entitled to the first two prizes, or not, and pending the decision of the referee, which was not made when we left, the tie for the third prize was shot off as follows:—

A. Hall.....	0 1 1—2.
E. Booth.....	0 1 1—2.
J. Jorey.....	1 1 1—3.
R. Penn.....	0 1 0—1.

The Kennel.

—Dog slaughter, as a profession in the city, has not improved. It still seems to be bungled. Though carbonic acid will kill, it smothers too slowly. If a little carbonic oxide were added, which is not hard to make, such a mixture of gasses would kill. The trouble in the pound slaughter was that the dead-box was never made air tight. The matter has ended by the arrest of Mariott, the pound-master, by Mr. Bergh's officers. We might write columns on this subject, we suppose, but it would be useless. Public opinion has, however, worked a cure. The calling in of outside help will certainly be done away with, and the temptation to steal dogs will be withheld. Mr. Morris, the originator of the scheme for dog catching, has come in for a good share of obloquy. No doubt our worthy Alderman meant well, but, as experience has proved, suggested one of the worst possible methods of getting rid of the curs.

JUDGING ON THE SHOW BENCH.—No. 2

THE GREYHOUND

HEAD long and narrow; ears pendulous, or partly so, small, and fine in substance; eyes bright and full of fire; jaw long and muscular, lean in appearance, with a set of good teeth; neck long, muscular, with a slight inclination to arch, just sufficient to be perceptible to an observer of symmetry, which gives to the head and neck that graceful appearance hardly to be described. No throatiness or loose skin to appear; shoulders should be oblique, slanting back, with elbow straight from the shoulder; fore-arm straight and full of muscle; lower leg round and strong, with nice moderately round foot, slightly in-arched toes; chest deep, with a proportionate width; back broad, deeply ribbed; loin wide and full of muscle; hip full of muscle, and wide where loin and hip are set together, with enormous well developed stifles; well-bent strong hock; good round muscular lower leg, with good strong roundish feet; stern nicely set on, long and tapering, free from feathering; colors, many.

POINTS IN JUDGING.

Head.....	15
Neck.....	10
Shoulders.....	15
Legs.....	10
Feet.....	10
Hind-quarters.....	15
Back.....	10
Loins.....	10
Tail.....	5—100

THE DEERHOUND.

Head somewhat of the greyhound shape, only more massive and muscular in all points, with a narrow, long, "tear-away" appearance; ears narrow, somewhat pendent—rather rat-like—not too long, and just sufficient leather in them to well cover the orifice; very prominent eye, looking sharp and far-seeing; jaw long and powerful, with a set of good teeth; no pendulous lip; neck long and muscular, free from throatiness, but set deep into chest; shoulders sloping, with a racing appearance; chest deep, with a fair and symmetrical width; back flat and wide, with good deep ribs; loins wide and muscular; hips powerful where set on to the loin, with very muscular stifles, well-bent hocks, and with a good substance from the hock to the foot; fore-legs must be strong, straight, and full of muscle, with a nice in-arched foot, slightly rounded; stern long, and tapered off to a point, nicely set into back; coat harsh and wiry.

POINTS IN JUDGING.

Head.....	15
Neck.....	10
Shoulders.....	15
Legs.....	10
Feet.....	15
Loin.....	10
Coat.....	10
Hind-quarters.....	15—100

THE NEWFOUNDLAND.

Head wide and full across between the ears, the skull rising towards the back; ears carried quite close to the head, moderate size, and not feathered; eyes small for such a noble head, but very intelligent, deepish set in the head, free from appearance of being bloodshot; nostrils open and large with considerable contractile power; jaw long; lip very little pendulous; neck rather short but full; deep shoulders and chest; legs of great power; feet webbed. The leg of a pure Newfoundland is short for the height of the dog, his immense depth of body, rather than length of leg, giving him height. Back long, loin loose, seldom well ribbed up; hind-quarters inclined to be flat; tail bushy, not carried over the back; coat free from curl.

POINTS IN JUDGING.

WEST TROY, June 17, 1874.

EDITOR FOREST AND STREAM:—

Your correspondent "Homo" has been misinformed in relation to Kirby's narrative. It is still intact, and I think as he does, it would be a great disfigurement to dock it. Every hair in it shows the marks so frequently mentioned in the description of the field trial breed, viz: long, slender, cimetar-shaped, &c. Banshee has had a little of her tail taken off, which is entirely healed and shows no stump larger than a pipe-stem, and she carries the prettiest flag you ever saw. For a young one she beats out anything I ever handled. I think the Dr. has a prize in these two bitches, and if he can find a dog of as good breeding to mate with Kirby the progeny must rate as high as any in England or America. As for Banshee, a prettier pair than she and the Doctor's little Dan never came together. By the way, I know little Dan, having handled him last fall, and he is all the Dr. claims for him. It is my humble opinion, truthfully expressed, that at some future day the stock from Kirby and Banshee will make some of the owners of our celebrated dogs sick. Being well acquainted with the Irish setters, having owned and broken them, I must say I never saw the equal of Banshee for speed, nose, staunchness and endurance, taking in consideration her age—less than one year. I am like that thorough sportsman, Scott Rodman, Esq.; I go my length on the breed. Much has been said in relation to dogs losing their scenting powers by a sea voyage, and this probably deters many from importing. I would here state that if Kirby and Banshee have in the least degree lost any of their nose by the voyage, they must have been truly wonderful. I am expecting a pair of pointer puppies from the kennels of Mr. Macdona, and you may hear from them in time.

Yours respectfully,

J. H. F.

Rational Pastimes.

—The Philadelphia cricketers have wisely arranged their matches this season with a view of economizing time, as have our local clubs. Instead of one day matches, ostensibly beginning at ten A. M., but in reality at two P. M., they are arranged to be played out by beginning play at three o'clock of an afternoon and playing one innings each side each afternoon. In Philadelphia this plan has also been found to work well. Besides this, in the latter city they play a part of a full game on one Saturday and finish it the Saturday following. A game of this kind was commenced on the 20th of June, when the Philadelphia and Germantown elevens began a game together, to be finished next Saturday. The Philadelphians went in first, and scored 84, of which Law was run out for 20. L. Baird carried his bat out for 24, and Newbould was stumped for 19. The Germantowns then went in, and put on 87, Caldwell's 16, Brewster's 17, and Jas. Large's 11, not out, being the double figures obtained. In the second innings of the Philadelphians they scored 164, of which Hopkinson ran up the fine total of 63, not out, C. Baird getting 16, and Law and Loper Baird 15 each, Gaskell scoring 12. This leaves the Germantowns 162 to get to win next Saturday, a rather up hill piece of work. R. Ashbridge took 6 wickets for 30 runs, and Brewster 4 for 31.

—The St. George cricket club of New York city is arranging for an excursion to Massachusetts about the 1st of July. They will probably arrive in Boston on the 3d, and play a match with the Boston cricket club on that day. On the 4th they intend to visit Salem, and play the Alpha club of that city.

—A grand cricket tournament will be held at Halifax, Nova Scotia, on August 18th and following days, when the following matches will be played:—

August 18th and 19th—England vs. America.

August 20th and 21st—Canada vs. America.

August 22d and 24th—England vs. Canada.

August 25th and 26th—Halifax vs. all others.

The following prizes will be offered for competition:—A silver challenge cup, value £20, presented by His Worship, the mayor of Halifax, to the champion eleven in three first matches. A silver subscription cup, value £10, presented for the highest individual average in batting during the tournament. A silver cup, value £5, presented for the best average in bowling during the tournament. Prize bats and balls will also be offered for every fifty runs obtained in a single innings, and for superior bowling. Any information relative to the tournament or the routes will readily be given on application by Messrs. Almon & Macintosh, of Halifax, or by the committee of management, Capt. N. W. Wallace, Sixth Royal Rifles; Capt. J. Douglas, R. A.; Lieut. F. Carpenter, Eighty-seventh R. I. Fusiliers, and M. Daly, Esq., H. C. C.

—On June 20th the St. George club had a quiet practice game on their ground at Hoboken between sides chosen by Messrs. Souther and Bowman, the former winning the one innings match by a score of 102 to 64. Moeran's 26, Sleight's 19, Souther's 16, and McKay's 10 were the best scores on the winning side; Bowman's 21, and Carpenter's 11 being the leading figures on the other side.

—By the expiration of three weeks a decided lull in professional contests will have taken place in this vicinity, as on the 16th of July the Athletic and Boston clubs will take their departure for Europe, to be gone until the last of August, and during August our local professional nines will play most of their games out of town, as that month is the dull-est of the season for professionals in New York. During the last of July, and the principal part of August, the professionals find it profitable to play exhibition games in country towns and watering places, and also to take trips out west and to Canada. To make amends in the way of base ball excitement, there is more amateur playing during

this interval than at any other period of the year, as the schools and colleges have vacation, as also the clerks of the commercial houses, and all these rush into base ball in lively style during July and August.

—The full record of championship contests up to June 22d, inclusive, is as follows:—

Club.	Athletic.	Atlantic.	Baltimore.	Boston.	Chicago.	Hartford.	Mutual.	Philadelphia.	Games Won.
Athletic.....	0	3	2	0	1	3	2	4	15
Atlantic.....	2	1	2	1	0	0	0	0	5
Baltimore.....	2	3	2	2	2	3	4	4	22
Boston.....	1	0	2	1	0	0	0	0	6
Chicago.....	2	1	2	0	0	1	0	0	6
Hartford.....	1	2	2	1	0	0	1	0	6
Mutual.....	2	1	1	2	3	1	2	0	13
Philadelphia.....	0	1	4	0	2	1	2	0	10
Games lost.....	9	11	19	6	9	12	9	8	83

The following are the championship games played in the professional arena since our last issue:—

June 16—Mutual vs. Boston at Brooklyn.....	5 to 2
June 16—Athletic vs. Hartford at Hartford.....	11 to 4
June 17—Boston vs. Athletic at Boston.....	12 to 8
June 17—Philadelphia vs. Chicago at Philadelphia.....	15 to 6
June 18—Mutual vs. Chicago at Brooklyn.....	38 to 1
June 19—Athletic vs. Hartford at Hartford.....	31 to 6
June 20—Philadelphia vs. Baltimore at Baltimore.....	9 to 5
June 21—Boston vs. Hartford at Boston.....	15 to 1
June 22—Atlantic vs. Chicago at Brooklyn.....	10 to 3
June 22—Athletic vs. Atlantic at Brooklyn.....	5 to 4
June 22—Chicago vs. Hartford at Hartford.....	14 to 11
June 22—Philadelphia vs. Baltimore at Philadelphia.....	13 to 7
June 24—Athletic vs. Mutual at Brooklyn.....	11 to 7

The average is a poor one compared to that of the first week in June, but two good fielding games being played, as the scores show.

The local amateur contests since our last include the following games:—

June 18—Alert vs. Arlington at Orange.....	8 to 6
June 18—Jasper vs. Flyaway at Manhattanville.....	12 to 8
June 18—Princeton vs. Montague.....	24 to 3
June 19—Chatham vs. Olympic at Melrose.....	6 to 2
June 20—Nameless vs. Washington at Prospect Park.....	13 to 8
June 20—Oriental vs. Hudson at Central Park.....	14 to 6
June 20—Ocean vs. Bureka at Central Park.....	15 to 8

The best played amateur games thus far in June are the following:—

Chatham vs. Olympic.....	6 to 2
Baltic, of Harlem, vs. Athletic, of New York.....	9 to 5
Yale vs. Knickerbocker.....	9 to 5
Leaders vs. Nassau.....	8 to 3
Princeton vs. Germantown.....	8 to 1
Excelsior vs. White Stockings, of Philadelphia.....	8 to 2
Arlington vs. Montague.....	8 to 4
Barnes & Co. vs. Raynor & Co.....	8 to 5
Alert vs. Arlington.....	8 to 6

—The Chicago nine—known as “the \$15,000 team”—put in an appearance in Brooklyn for the first time this season on June 18th, and as it was the anniversary of the battle of Waterloo they signalized the day by being the recipient of a regular Waterloo defeat at the hands of the New York Mutuals, the score being the remarkable one of 38 to 1 only, and that one was the result of an erroneous decision of the umpire. The Chicago nine was charged with thirty-six fielding errors, and the Mutuals earned twelve runs off Force’s pitching.

—The Atlantics beat the Chicago White Stockings on the Union grounds on Saturday—10 to 3.

—The use of a lively, elastic ball in base ball contests is this season falling into bad odor among the best players of the amateur fraternity, and very properly so, too, as these elastic balls are death to good fielding, and fertile as sources of severe injuries in the practice of the game. None but the “muffer” brotherhood use them now in the eastern States.

—The New York Arlingtons visited South Orange on June 18th, and at the Seton Hall ball grounds they played a very pretty game with the Alert nine, and after a close contest were defeated by the small score of 8 to 6 only. A dead ball was used.

—The Yale college nine have this season played all their games under the professional code of playing rules, simply for the sensible reason that they have had none other to go by, there being none but the professional rules in print. The Yale games have been quoted as samples of fine play under the amateur code, and yet the author of the statement knew that Yale had refused to play the Princeton match simply because they desired to play under “regular” rules, and there being no regular playing rules in existence save those of the professional association, they properly declined to play under an unwritten code.

—The professional clubs are in search of a reliable, non-elastic, or “dead” ball; one which is not lively, and yet not too soft. Mahn “S” ball is found to be too elastic at times, as it was in the Mutual and Boston game of June 13th, when the score was marked by the heavy hitting figures of 19 to 11, and in favor of the Mutuals. The “Ross” dead ball, which was played with in the 2 to 0 game, was a grand one, but a similar one used in the Boston and Atlantic game of June 15th was rather lively in the ninth innings. The “Reach” ball, too, used in the Philadelphia games, is too lively, as the scores of the games recently played there show. An elastic ball, wound tight with fine yarn, and made too hard, is not only death to good fielding, but it leads to serious injuries, and it ought to be ruled out. No clubs which justly pride themselves upon their fielding skill now use lively balls. The elastic sphere, however, is still popular with the muffin class of city players, and with country nines, who erroneously imagine that heavy hitting is skilful batting.

—The remarkable feat of Dan Carr, at Green Bay, Wisconsin, is the talk of principal walkers in various parts of the State. This was no less than the task of walking one hundred consecutive hours. Towards the close he offered to bet from \$500 to \$1,000 that he could continue six hours longer, but no one accepted it.

—The Manhattan club opened play for the season at Hoboken on June 16th, when a good practice game was had, in which the members of the metropolitan clubs participated.

—The Boston *Globe* says that “to the challenge that was sent by the Princeton nine to play the Harvards a series of matches in Boston, New York, or Saratoga, Captain Tyler has accepted it on condition of Princeton playing the games according to professional rules, by which the games between Yale and Harvard will be governed.” So that if the Princetons desire to enter for the college championship they must play under the regular printed code of rules.

—The Easton club nine—called amateurs, though they pay some of their men—visited Philadelphia on the 18th instant, and signalized the day’s play by defeating the Philadelphia professional team by 11 to 2. This is the second defeat sustained by a professional nine at the hands of amateurs this season.

NEW HAVEN, June 20th, 1874.

EDITOR FOREST AND STREAM:—

For the first time in five years the Athletics, of Philadelphia, and the Yales crossed bats in this city this afternoon. The game was sharply played until the end of the sixth inning, the score then standing 4 to 2 in favor of the Athletics, after which the visitors began to punish the Yale’s pitching, and they added seven runs to their score, the Yales drawing blanks in all but one inning. At the end of the game score was Athletic 11, Yale 3. The Yale nine visits Hartford on the 27th instant, to play four games with the “Nutmeg” professionals, on June 27th, 29th, and 30th, and July 1st. On July 3d and 4th games are to take place at Baltimore between the “Canaries” and the “Blues.” The Princeton and Yale nines being unable to agree upon a code of rules to play under, the Princetons preferring those made by the Amateur Base Ball Association, and the Yales those made by the Professional Base Ball Association, the match was declared off. Since then, however, negotiations have been resumed, and it is now announced that a series of games will be played between the two nines. The first game is at Hartford July 2d, the second game to be played at Brooklyn July 7th. The Yales play the Mutuals at Brooklyn the day before. The Freshmen nine left for Boston on Monday to engage in the tournament between the different freshmen clubs, which commences on that day at the “Hub.”

CORNELL UNIVERSITY, ITHACA, June 18th, 1874.

EDITOR FOREST AND STREAM:—

Quite a time has elapsed since my last communication, yet it must not be inferred because few things worthy of being chronicled have occurred that we have been inactive in regard to athletics. We have been at work during the last two terms, and we trust to some purpose. The first event was a game of football, May 23d, between the class forties of ’76 and ’77; a well contested game throughout, showing some very fine playing on both sides, but ’76 was a little too skilled for ’77, and proved its right to the title of “champion” by winning in three straight goals. Time: 35½, 30½, and 6½ minutes respectively. Friday, the 29th of May, the base ball club played a game of base ball at Geneva with the Hobart college boys, and were beaten by a score of 43 to 16. There was some fair playing, but the great unevenness of the field was detrimental to good playing on either side. The last regatta of the Cornell navy, Saturday, June 6th, was the best which has taken place since the organization of the navy. In the morning there were two six-oared races for the Cluck and Tom Hughes cups; the former was won by the ’74 crew in 14 min., the latter by ’76 in 13 min. The distance was a little under two miles; ’74 was started about 100 yards nearer the two mile point than in the other race, and the crew ceased rowing before the signal, which accounts for the difference in time of the two races in favor of the younger crew. In the afternoon the principal event was the two mile running race, for which there were three entries. The contestants were Copeland, ’75; Larned, ’76; Simmonds, ’77, and they came in in the order named, Copeland winning easily. The time of Simmonds was 11 min., 4 sec.

—Mr. Barnum proposes to add to his performances certain athletic games, in which professionals and amateurs will join. Some \$2,000 worth of prizes are offered. The sports are to take place at the hippodrome.

Yachting and Boating.

All communications from Secretaries and friends should be mailed no later than Monday in each week.

HIGH WATER, FOR THE WEEK.

—The annual regatta of the Aleyone Boat Club of Brooklyn, which took place on June 20th in Gowanus Bay, was one of the most successful aquatic entertainments known in the club annals. This organization confine their regattas to contests among their club members, the object of the club being merely recreative exercise, and their annual regattas have become the fashionable aquatic events of the season in Brooklyn. The arrangement for Saturday’s regatta included two contests and an excursion, the races being between two six-oared and two four-oared gigs, the contesting crews being as follows:

Six-Oared Gig Race—The “Blonde,” Colors Blue: Harry T. Frost, stroke; Wm. J. Oliver, Wm. Tryon, Thomas G. Wells, C. T. Ulrich, Wm. T. Lawrence, Wm. B. Cromwell, coxwain. The “Brunette,” Colors Red: Samuel P. Pope, stroke; Frank H. Howland, Abram Allen, Jr., F. D. Green, Wm. Humphrey, E. C. Lockwood, Richard C. Field, coxwain.

Four-Oared Gig Race—the “Flirt,” Colors Red and White: Daniel Chauncey, Jr., stroke; Wm. W. Richards, Alfred Stillman, F. P. Pike, L. G. Dalby, coxwain. The “Coquette,” Colors Blue and White: Wm. C. Howard, stroke; Wm. D. Steele, George Mackay, Wm. T. Sharpe, A. H. Tupper, coxwain.

Two steamers were engaged by the club, one for the use of the judges and one for the guests of the club. The course was from foot of Court street straight away two miles to a stake boat at Bay Ridge. The weather was cool and windy, but both wind and tide were in favor of course. The races began at 4:20 P. M., at which time the crews of the “Blonde” and “Brunette” were started by Judge W. V. Tupper, and the six-oared gig race began. The “Brunette” secured a slight lead, starting off with a stroke of nearly forty to the minute, but they soon fell down to thirty-eight and less, and as the “Blondes” steadily adhered to a thirty-eight stroke, they gradually went to the front, and, maintaining their lead, came in victors in 12 min. 21 sec., the “Brunette’s” time being 12 min. 24 sec. At five o’clock the four-oared gigs started, the “Flirt” taking a leading position at the start with a thirty-eight stroke,

which, after the first mile, went down to thirty-six, all-keeping stroke very creditably. But the “Coquette” soon began to close the gap between them and to lap the stern of the “Flirt,” the race at this time being exciting. When about two-thirds of the course had been rowed the stroke of the “Flirt,” as plucky a rowist as ever handled an oar, showed signs of distress, and the stroke fell off to an extent which gave the “Coquette” easy work to win, and the latter passed the line on 12 min. 51 sec., the “Flirt” following in 13 min. 2 sec. The moment the latter passed the line, Young Chauncey lay down, suffering from a severe attack of vomiting. He recovered, however, and on the excursion afterwards participated in the dancing. The committee of the day were as follows:

Floor Committee, Blue Badge—Geo. R. Read, Chairman; Edward S. Sanford, Jr., Wm. T. Lawrence, Harry P. Bartow, E. C. Lockwood.

Executive Committee, White Badge—Charles H. Hunter, Chairman; Geo. R. Read, Henry W. Maxwell, Frank H. Howland, Edward Arnold.

Judges—At Start, Wm. V. Tupper; at Home Stake Boat, Richard Oliver.

—On Monday the second annual regatta of the Rowing Association was held. For the \$300 diamond challenge badge, the first heat was won by Frank Yates, the second by W. B. Curtis. The pair-oars race for the ladies challenge cup, resulted in a dead heat between the New York and Nassau Rowing Clubs. It was rowed over again Tuesday. The four-oar race between the Gramercy, New York Athletic and New York Rowing Club, was won by the latter, distance two miles.

EAST BOSTON YACHT CLUB REGATTA.—The new organization had their first regatta off Long Island, Boston Harbor, on the afternoon of June 17th. Two prizes were offered for competition in each class, for keel and centre-board boats. There were nine entries in each class. The course of the first-class was fourteen miles in length and the prize for centre boards was taken by the Mabel.—Time, 4h. 1m. 35s., and for keels by Gull, 4h. 15m. 52s. The course for second-class was nine miles long. The Lidie was awarded the prize for keel boats, and the Sunbeam took the centreboard prize.—Time, 5h. 22m. 45s.

The officers of the club are:—Commodore, E. P. Curran; Vice Commodore, Henry T. Wheeler; Fleet Captain, Ambrose Martin; Secretary, P. W. Golliff; Treasurer, Geo. F. Crane; Measurers, J. H. Caldwell and Geo. Morrison; Trustees, M. Callahan, H. T. Wheeler, W. H. Litchfield.

CHAMPIONSHIP REGATTA OF THE SOUTH BOSTON YACHT CLUB.—The first of the series of championship races given by the South Boston yacht club came off Thursday P. M. 18th inst., off City Point. The wind blew almost a gale, and but few boats ventured out. The Mabel, Commodore Roberts, fouled her peak halyard, and the Posey, Vice Commodore McKee, carried away her mast. She was towed in by the Mabel. The Naiad Queen, Ripple and Posey entered in the first-class centre-boards. The course was over nine miles, and was won by the Ripple, Captain Macomber. The Maud, the Mabel and the Unique entered in the second-class centre-boards, Maud, owned by Capt. E. C. Fuller, won. The Fearless and the Uncle Moses entered in the second-class keels. The Fearless, owned by Capt. J. A. Woodard, won. The course for the second classes was over six miles. The judges were:—Messrs. T. Christian, J. G. Chambers, P. P. McDonald, E. W. Hawes and A. K. Roberts, who were stationed on the Commodore’s yacht “Mercury.”

DORCHESTER YACHT CLUB REGATTA.—The second regatta of the Dorchester Yacht Club for the champion prize, took place in Dorchester Bay on Saturday afternoon, 20th inst., and was one of the most successful of the season. The new rule of the club, which allows yachts to shift ballast while on a run, was in vogue for the first time, and but little if any of it was indulged in. This being the second regatta of the series, it was the final one as regards the prizes, with the exception of one, that for the third class. The rule was, the yacht winning two out of three regattas should have the prize awarded for its class. There were seven classes and a prize for each class, all being of equal value, and all solid silver goblets. In the first regatta, the winners were the Nimbus, Mabel, Maud, Tulip, Phantom, Fearless and Sunbeam. All these were victorious again on Saturday, except the Maud. The courses sailed were No. 2 of the regular courses for all but the fourth class centre-boards, that class sailing course No. 3. The first is about nine and a half miles, and the second (No. 3) is about five and a half miles. The judges of the regatta were ex-Commodore Coolidge Barnard, William A. Gilbert and W. H. Sayward, and Fleet Captain Parkman Dexter tendered for their use his new and beautiful sloop the Mariquita.

The following is the winners’ sailing time, as made out by the judges:

FIRST CLASS KEEL SCHOONERS.		
Name.	Commander.	Time.
Phantom.....	T. V. Clark.....	1 58 41
FIRST CLASS KEEL SLOOPS.		
Sunbeam.....	W. S. Nickerson.....	1 32 12
SECOND CLASS KEEL SLOOPS.		
Fearless.....	J. A. Woodward.....	1 30 01
FIRST CLASS CENTRE-BOARDS.		
Nimbus.....	E. Burgess.....	1 27 21
SECOND CLASS CENTRE-BOARDS.		
Mabel.....	J. N. Roberts.....	1 17 43
THIRD CLASS CENTRE-BOARDS.		
Maud.....	C. E. Fuller.....	1 28 27
FOURTH CLASS CENTRE-BOARDS.		
Tulip.....	Walter Burgess.....	1 07 24

The prize for the third-class centre boards now lies between the Maud and the Water Witch, and will have to be sailed for in the regatta on July 18.

THE LYNN YACHT CLUB.—Their first regatta of this season, took place June 17th, in Lynn Harbor, Mass. The following are the names of the winning boats and their corrected time:

FIRST CLASS.		Corrected Time.
Name and Owner.		H. M. S.
Maggie—E. C. Neal.....		1 53 35
Lillie—G. L. Babb.....		1 54 24
SECOND CLASS.		
Expert—N. T. Davidson.....		1 42 52
Kate—W. E. Neal.....		1 41 21
THIRD CLASS.		
Mabel—J. N. Roberts.....		1 33 54
Lizzie Taylor.....		1 40 10

The distance sailed by the first class was eleven miles, and of the second and third classes, nine miles. The prizes

in the first class—\$15 and \$10—were awarded to the Magic and Lillie; in the second class (same prizes), to the Expert and Kate; and in the third class—\$10 and \$5—to the Mabel and Lizzie. A collation was provided on the judges' boat.

—Richard J. Baker of Boston, owner of the schooner-yacht Vesta of the New York yacht club, and which has been at Newport all winter, has sold her to a New York gentleman.

—The annual review of the Bunker Hill Yacht club, by Commodore J. H. Pitman took place at Long Island, Boston Harbor, June 17th, twenty boats taking part in the proceedings. The fleet sailed for the rendezvous at 11 o'clock A. M., and were accompanied by a band of music. After the review the members of the club sailed among the islands in the harbor, and at a late hour returned to their homes after an enjoyable day.

—The following is the programme of the Fourth of July sailing regatta, to take place off City Point, in Boston Harbor:

First Race.—For sloops and schooners measuring thirty-eight feet and upwards on the water line. Prizes.—For sloops:—First prize, \$100; second prize, \$50. For schooners:—First prize, \$200; second prize, \$100.

Second Race.—For centre-board and keel sloops and for schooners measuring twenty-five feet and less than thirty-eight feet. Prizes.—For centre-board sloops:—First prize, \$90; second prize, \$50. For keel-sloops:—First prize, \$90; second prize, \$50. For schooners:—First prize, \$90; second prize, \$50.

Special race for fishing boats measuring twenty-five feet and less than forty feet. The course to be sailed will be the same as for second-class yachts. The boats will be permitted to use their working sails only, and the prizes will be awarded to the winning boats without allowance for measurement. First prize, \$50; second prize, \$25.

Third Race.—For centre-board and keel boats measuring twenty feet and less than twenty-five feet. Prizes.—For centre-board boats:—First prize, \$70; second prize, \$35; third prize, \$25. For keel boats:—First prize, \$70; second prize, \$35; third prize, \$25.

All entries are free, and may be made at J. M. Bugbee's office, City Hall, until 4 o'clock, Friday, July 3d.

Committee.—James Power, Chairman; Wm. F. Brooks, H. W. Harrington, Benj. Dean, Wm. H. Kent.

Judges.—A. Claxton Cary, Chairman; Samuel R. Spinney, Charles A. Hayden, Thomas Manning, Benjamin James.

By the rules of the races there are no restrictions in regard to sails, except for fishing boats, which will be permitted to use their working sails only.

—A yacht has lately arrived in New Bedford from New York, in charge of her owner, Capt. Young, of ship Sereamer, of New York. She is thirty-three feet long, nine feet beam, is slooped rigged, but is not yet named. Capt. Young purchased her in Genoa, Italy, and brought her to New York on the deck of his ship, rebuilding her on the passage, so that she is now an American vessel. She was built for a regatta club of students, in the royal ship-yard at Genoa, but the young men ran her ashore, when Capt. Young bought her.

THE SCHUYLKILL REGATTA.—In August of last year it was suggested in the Schuylkill Naval Board, that they hold, annually, a regatta, open to all amateurs, in view of a grand regatta, to be held at the time of the Centennial in 1876. This idea was kept persistently before them by their energetic Commodore, James M. Ferguson. Little more was done, however, until in March, when a regatta committee of one from each club in the navy was appointed as follows:—

J. Gillingham, Undine; G. W. Parker, Quaker City; R. H. B. Fairman, Pennsylvania; W. A. Steel, Crescent; E. S. Miles, University; C. B. Hart, Philadelphia; J. Bediehlmer, Malta; J. C. Pinkerton, West Philadelphia, with Mr. John Hockley, Jr., the Vice Commodore, as Chairman.

The Committee met and adopted the rules of the National Amateur Regatta with such slight modifications as would meet the altered circumstances. They accepted the National Association's definition of an amateur, and the rules of boat racing as adopted by them. A Prize Committee was appointed, consisting of Messrs. Steel, Pinkerton, Parker, and Hockley. Messrs. Miles, Fairman and Bediehlmer were appointed a Committee on "Stake and Tug Boats." Invitations were issued to the amateur clubs of the country and met with general attention, although regattas elsewhere combined with various circumstances to lead the navy to think that the entries would be few.

The preparations were liberally made. The Prize Committee made their selections with great taste, and for the winner of the four-oared shell race, offered a magnificent Silver Punch Bowl, valued at \$600, the gift of Commodore Ferguson. For the pairs there was a handsome Silver Pitcher. For doubles the prize was a Silver Ice Bowl. For the winning single sculler they offered a fine bronze statue of the Gladiator. These are all challenge prizes, and will be rowed for annually. Handsome presentation medals were given to the members of each winning crew. The Reception Committee, consisting of one member from each club, made ample provision.

James M. Ferguson was chosen umpire; Mr. N. Thouron, starter; and Mr. H. M. Guillon, judge.

Wednesday, June 17th, the first day of the regatta, dawned clear, cool and bright, with a strong south-east wind. By the time fixed for the start, 2:30 P. M., the water had flattened considerably, but was still lumpy, the wind blowing right up the river.

The course, one of the finest in the country, is from below the Falls Bridge to Rockland, a distance of one-and-a-half miles, the last mile a straight, wide stretch, in splendid view from the bluffs on the east. The Banks on both days were crowded with vehicles and pedestrians.

The first day was devoted to the trial heats for fours and singles and the deciding heat for pair-oared shells. The following crews drawing the first heat:—Friendship Boat Club, New York—Mr. Robinson, stroke; James McCartney, William Hurley, Thomas Allen, bow; station, west; colors, blue.

Pennsylvania Boat Club, Philadelphia—John Lavens, Jr., stroke; Frank Henderson, Max Schmitt, Oscar F. West, bow; station, centre; colors, white.

Crescent Boat Club, Philadelphia—A. Spering, stroke; C. D. Tannan, E. A. Thompson, W. Barnhurst, bow; station, east; colors, red.

With unusual promptness the boats drew into line, and went away at 2:45, well together, but in a few hundred yards the Friendship crew showed to the front a couple of clear lengths, gaining constantly, while the Crescents, al-

though pulling in much better form than either of the others, were gradually dropping behind. At the bend of the river, however, the Friendships began to fail. The starboard side of the Pennsylvania boat evidently felt the strong wind also, for their boat crossed over to the shelter of the west bank, when their bow made a fine course to the near head of the island. Here Allen going wild again, headed his boat almost directly across the river, and the wind being high, and the boats seeking the shelter of the west bank, fouled with the Pennsylvanias, and received their bow, amidships. Having got clear, with more than a length ahead, they started again, and although they seemed to get speed out of their boat, they had no time for zig-zagging. Lavens, with more life in his stroke than we ever saw before, carried his boat right past them, and won in 10 min's. and 16½ sec's. The Friendship, less than a length behind, made 10 min's. 18 sec's., while the Crescent, which had been pegging away during the foul, gaining a few lengths, crossed the line in 10 min's. 46 sec's.

The second heat was between but two boats, the others having been withdrawn. The crew of the Vesper, Philadelphia, with H. McMullan, stroke; J. B. Evans, J. B. Mingus, and R. C. M. Mingus, bow, were placed on the east, with white for their colors, and were pitted against the famous crew of the Argonauta Rowing Association of Bergen Point, N. J., Fred. C. Eldred, stroke; W. Man, B. Stephenson, Ed. Smith, bow.

At the word both crews made the water fly, but Evans, of the Vesper, stepped off his seat, and before he could regain it the Argonautas, with their long, powerful swing, had put some three lengths of clear water between the boats, though pulling at not more than thirty-six strokes to the minute. Evans' mishap seemed to demoralize the whole Vesper crew, as they first nearly ran into the tow-path, and then made the mud and stones fly near the Willys. McMullan got off his seat, but he exhibited pluck worthy of praise, and at the head of the island made a grand dash to catch the leading boat, and closed up the gap wonderfully. The Argonautas won in 9 min's. 47½ sec's., while the Vespers, time was 10 min's. 00 sec's.

After all their wild steering and mishaps, their time was more than a quarter of a minute better than the winners of the first heat. As the Pennsylvania lost a little more than that much while fouled with the Friendship, it looks as if—had they drawn together in a heat—there would have been hot work between these home clubs.

The only pair-oared heat was between the Nassau, of New York, John A. Walker, stroke; Frank G. Brown, bow; the Undine, of Philadelphia, I. N. DeHaven, bow; A. B. Frost, stroke, and the Gramercy, of New York, H. M. Howell, stroke; Wm. F. Gannon, bow. The latter crew rowing under protest, it being claimed that Gannon is a professional.

The Nassau came in winners in 10 min's. 40½ sec's.; the Undine in 10 min's. 51½ sec's.; the Gramercy badly distanced.

The first trial heat for singles was between Messrs. F. M. Hartley, John Lavens, Jr., and W. G. Thomas, all of the Pennsylvania Club of Philadelphia. Thomas had the west and Lavens the centre. The eastern boat seemed slow in getting off. The western stake boat seems to have an advantage both in position and current, which should be corrected. They were well bunched for a hundred yards. Thomas spurring hard for a commanding lead, and Hartley dropping off, evidently being used up. Around the bend Lavens and Thomas went right together, both pulling 33, but Thomas' spurring began to tell on him, and Lavens passed him, easily winning in 11 min's. 47½ sec's., Thomas 12 min's. 24 sec's., Hartley giving it up when almost past the island.

The second heat, single sculls, was between T. R. Keator of the Harlem Rowing Club, and F. C. Pleasonton of the Bachelors of Philadelphia. In weight and appearance the men were very equally matched. They both got away together, pulling well within themselves. Mr. Keator evidently taking his time to it, drew away easily, and when the four-oared shell of the Quaker City tried a little spurt with him they seemed surprised to see him slipping by them without any interruption to his amusement of seeing the people. He came in in 12 min's. 06 sec's., to Pleasonton's 12 min's. 31 sec's.

The last heat was a walk over for Mr. Ed. Smith, the bow of the Argonauta; Mr. Leibert, who was to be in the same, having withdrawn. He made his mile-and-a-half in 11 min's. 49½ sec's. against a stiff breeze.

The second day, Thursday, was devoted to final heats, the interest in which seemed to centre in the single race between Smith and Keator, it being generally understood that Lavens would withdraw. Mr. Keator has pretty thoroughly out-rowed all his competitors during this and last season, if we except W. B. Curtis. Mr. Smith is a good-natured little giant, who generally seems to do just enough to win easily, and to do that so coolly and gracefully that the effort is lost sight of.

The first heat was the final for fours, the result of which seemed a foregone conclusion. The Argonautas again had the west station, while the Pennsylvanias went to the middle stake boat. They got away well together, in less than one hundred yards the Argonautas were a length ahead. The Pennsylvanias followed, steering finely for the first mile, when West became too ambitious, or No. 2 weakened, and his side went away around, and it was sometime before the boat was straightened out again, but when once fairly pointed at the finish they picked up hand over hand, though the starboard was certainly the weak side. At the middle of the island they had almost caught their leaders, but Eldred "hit her up," and they went in at their ease in 9 min's. 01½ sec's., followed by the Pennsylvanias in 9 min's. 03 sec's.

Not until the Schuylkill clubs recognize the fact that something more than strength is required will they be able to successfully compete with crews which have really learned to row, in spite of the frequent assertions of one of the Pennsylvania crew, that form and style will not win races. The heat for doubles was conclusive, there being but two boats started.

The Nassaus crew was the same that pulled in pairs on the first day, and against them the Crescents had entered; C. E. Steel, stroke, and H. F. Witmer, bow. The Nassaus seem to have it all their own way, pulling splendidly together and driving their boat easily at a stroke not more than 36 to the minute. At the head of the Island they led by a half dozen lengths or more, but going too far to the east, the Crescents tried by a spurt to cut them off.

Here the Crescents six-oared barge crossed the river directly in front of the racing boats and rowed down along side Steel and Wilmer, coaching them in direct violation of

the rules of boat racing, an action which would probably have disqualified their boat, even if it had come in first. The Nassaus won in 9 min's. 31½ sec.; the Crescents' time being 9 min's. 45 sec's.

At ten minutes after six Mr. Keator and Mr. Smith got off well together, Smith pulling 38 and Keator 36, both working hard. Smith stuck to them manfully for the first quarter, but his sliding seat had been warped by lying in the sun, and stuck so that he slid off every few strokes. Keator seeing this took it easy, and at Laurel Hill had a half length clean, a lead which he greatly increased, finishing in 10 min's. 33½ sec's. against Smith's 10 min's. 40 sec's. and so ended the first annual, and the most successful regatta of the Schuylkill Navy.

After the races the Regatta Committee and the competitors, besides a goodly representation of boating men, repaired to Parlor C., Continental, where Commodore Ferguson, with brief and neat speeches, presented the prizes to the keeping of their respective winners, to be held by them until next year, when we shall again see a "struggle for the lead."

CITY OF BOSTON REGATTA.—The committee on the sailing regatta to take place July 4th, have made the following changes:—The amount of the first prize for sloops has been reduced from \$150 to \$100, and the second prize from \$75 to \$50.

The sum of \$75 thus reduced will be used as prizes in a special race for fishing boats, to take place immediately after the second race for yachts. The boats must measure twenty-five and less than forty feet in length. The first prize is fixed at \$50 and the second prize \$25. In this race no allowance will be made for measurement.

—A large party of gentlemen assembled on the deck of the magnificent steamer Rhode Island, on Saturday, at 1 P. M., to enjoy a trip to Stonington by daylight. Among the number were prominent representatives of our great railroad lines, and several members of the New York, Boston, and Western press. These gentlemen were the guests of the Stonington Steamboat Company, and were invited to make the trial trip of the opening season. Upon arriving at the boat each was received with seaman-like cordiality by Capt. D. S. Babcock, President of the Company, who transferred them to the polite and courteous attention of Mr. L. W. Filkins, the General Passenger Agent of the line. At 4 P. M. the guests sat down to a sumptuous dinner, served in the elegant dining room of the steamer. After the cloth had been removed some very happy speeches were made by Capt. Babcock, Messrs. John C. Wyman, Rufus S. Andrews, Col. Home, and others too numerous to mention. Stonington was reached in the early evening, and after a walk under the elms of one of New England's prettiest coast towns, the guests returned to the steamer and were soon on their way back to New York. The city was reached at about six the next morning. No trip is more enjoyable than this one, and to our readers who are anxious to take a short rest from their daily labors, we say try this excursion and it will repay you. The elegant steamer Rhode Island leaves Pier 30, North River, at noon, and Twenty-third Street Pier, East River, at 1 P. M. every day, arrives at Stonington by daylight, and returning reaches New York by six the next morning. The fare is \$3, and for a short trip this one is unsurpassed cheapness, comfort, and beauty of scenery.

—We acknowledge with thanks the receipt of complimentary tickets to the regatta of the Patuxent Navy, to be held at Baltimore to-day. The Navy is composed of the boats of the Ariel, Undine, and L'Hirondella Rowing Clubs.

New Publications.

CHAPTERS ON ANIMALS. With illustrations. Philip Gilbert Hamerton. Roberts Brothers, Boston: 1874.

Whether Philip Gilbert Hamerton painted as well as he wrote, we think has been decided long ago in favor of the latter. Wonderful is it how clever Englishmen are as art critics; but their power of portraiture by words and letters stands generally higher than their work with oil and brush on the canvas. "The Chapters on Animals" are written by one who has the deepest and clearest insights into the life, nature and being of animals. There is a fund of thought developed by the author which prompts one to see in his descriptions of dogs, of horses, of goats, cats, oxen and asses, more than the meagre outlines of soulless creatures. Perhaps there never was written a more beautiful chapter than the one where the author apostrophizes the ivory skull of a dog, the companion of his younger days, and portrays the intense love that once pervaded the animal. There are here and there interspersed anecdotes of animals which are true poems. Listen to this: "A dog was bereaved of his master, and afterwards became old and blind, passing the dark evening of his existence sadly in some corner which he hardly ever quitted. One day came a step like that of his lost master, and he suddenly left his place. The man who had just entered wore ribbed stockings; the old dog had lost his scent and referred at once to the stockings, that he remembered, rubbing his face against them. Believing his master had returned after those weary years of absence, he gave way to the most extravagant delight. The man spoke. The momentary illusion was dispelled, the dog went sadly back to his place, lay wearily down and died." Apart from the admirable descriptions of the brute creation, there may be found in the book certain principles of art which must be invaluable to animal painters. It has been a long time since we have read so admirable a book as the one under review, so sweetly, so tenderly written. If the book is pervaded with a certain tinge of sadness, an approach to a peculiar morbid sensitiveness, the love and respect it must engender in the reader towards those companions, friends, or servants God has given us among the lower creation, makes the "Chapters on Animals" dear to us. It is a book to keep and read and to turn to over and over again, always to find in it ample food for reflection. It is only an Englishman with an intense love for animals and a familiar acquaintance with them, who could have produced such a thoughtful series of essays as may be found in the "Chapters on Animals."

THE BIRDS OF FLORIDA. Original descriptions of 250 species of different kinds of birds. By C. J. Maynard. With fine plates drawn and colored from nature. Part 3.

This very valuable number of a work in course of publication by the author now in Florida, contains a drawing of the *Phainopepla Zena*, and a history of this little finch, a full account of whose habits are pleasing and scientifically laid down. We do not hesitate to commend the works of Mr. Maynard as deserving a place in the library of every lover of birds in the country, and we know every ornithologist will give it a place in his portfolio of the rare and almost unknown birds of Florida.

Popular Science Monthly for July. N. Y.: D. Appleton & Co.

In looking at the number before us we are compelled to confess that among the so-called great lights upon scientific subjects that are placed before us every month, in huge tomes and long essays, no one stands before the *Science Monthly*. Started for the purpose of the diffusion of scientific knowledge of a high order, and always attractive in form, though dry in detail, becomes rich, and even ray, compared with much that we have to wade through in order to extract a few grains of wheat from a peck of chaff. This number has three papers; any one alone worth the yearly price of the book. We refer to "Telescopic Researches," "The Genesis of Woman," and "Mental Evolution."

TO LET, AT PAMRAPO, a Beautiful

Place on the Central Railroad of New Jersey.

Monthly commutation makes fare but seven cents a trip—part of a nice house facing the lovely bay of New York, near depot, to rent for \$10 per month. Inquire at office of Forest and Stream, 17 Chatham st.

PAMRAPO—with its beautiful sheet of water spreading before it, lovelier than the bay of Naples: its situation commanding a view of the Narrows—the gateway of the ocean—forming an ever-changing kaleidoscope of vessels homeward and outward bound. Its banks are dotted with the finest residences, and nestling also under its green foliage the bright painted houses of the several boat clubs, the Triton's and the Bayonne's, enliven the picture. This locality offers inducements for health to the resident and wealth to the investor, such as no suburb near New York can do. Only 23 minutes from New York by the Central Railroad of New Jersey, from the foot of Liberty street. Commutation only seven cents per trip, monthly ticket. Lots and houses for sale. Inquire at FOREST AND STREAM Office, for MR. JOSEPH HALLOCK, for full particulars. je251f

Ask your Dealer, or send direct to our

works for a supply of PURE TOBACCO.

VIENNA, AUSTRIA, Nov. 30, 1873.

Messrs. Wm. S. Kimball & Co.:

Sirs—A friend of mine sent me, with a transport of Indian Skulls, two pounds "Vanity Fair," which I declare to be the best Tobacco I ever smoked. We have very good tobacco in Vienna—Turkish and Hungarian, but "Vanity Fair" is the King of all, by its aromatic flavor and the right sort of strength. My friend in New York got an appointment in California, by that reason I apply immediately to you, begging you to send me the enclosed ten dollars, a supply of "Vanity Fair," and send with the next steamer to Germany. If there is a German firm that sells your excellent "Vanity Fair," I beg you to enclose me the address.

REMINGTON'S CHALLENGE
Long Range, Breech Loading,
TARGET RIFLE.

Weight, 10 lbs.
Length of barrel, 34 inches.
Calibre, .44-100 in.

Pistol-grip Stock. Fine Walnut
Oil Finished. Checkered Grip Cap.
hardened mounting.

The following discs for front sights.

At the "Long Range Match" of the "Amateur Rifle Club" on the 30th ult, 6 REMINGTON and 12 other rifles were entered. The score which we append below shows that the REMINGTON still maintains its superi- ority:

800 yards,	Average for Remington,	15	Average for others,	8 2-3
900 yards,	do.	11 2-3	do.	5 11-12
1,000 yards,	do.	9 5-16	do.	8 1-2
	Total average,	12	Total average,	8

Net gain of REMINGTON over all others, 50 PERCENT. At the 1,000 yard range only the eight highest in previous ranges were allowed to enter, which though admitting all the Remington's, admitted only two of the others. This fact will account for the approximate average at 1,000 yards. The two best marksmen on each side scored 30 with Remington's to 17 with the others. "Blood will tell." See this paper, of June 4th, for official record of the above. For full particulars of these rifles address

STILL AHEAD! IF YOU WOULD WIN, SHOOT THE REMINGTON.
At the long range match on the 13th instant for the Diamond Badge, Remington rifles won the first, sec- ond and third prizes.
The scores at which 14 Remington and 19 other rifles were entered, were as follows:—

Average at 500, 800, and 1,000 yards for Remington,.....624
Average at 500, 800, and 1,000 yards for others.....51
Twenty-two and a half per cent. gain for Remington. "A word to the wise," &c.

E. REMINGTON & SONS, 281 and 283 Broadway, N. Y.,
OR ARMORY, ILION, N. Y.

This arm was submitted in competition with over one hundred different systems, American and Euro- pean, to the Board of United States Officers, appoint- ed by Act of Congress, 6th June, 1872, for the pur- pose of selecting the best arm for the service, and of which Brig. Gen. A. H. Terry was President. It suc- cessfully passed through all the tests.

The following is the report of the Board:
"Resolved, That the adoption of magazine guns for the military service by all nations is only a question of time; that whenever an arm shall be devised which shall be as effective as a single breech-loader, as the best of the existing breech-loading arms, and shall at the same time possess a safe and easily manipulated magazine, every consideration of public policy will re- quire its adoption.

Resolved, further, That the experiments before the Board with the Ward-Burton Magazine System have so impressed the Board with the merits of this gun, that they consider it as more nearly fulfilling the con- ditions above specified than any other tried by them or of which they have any knowledge, and it does recommend that a number of magazine muskets be made on the plan for further trial in the field." (See Ordinance Report.)

We are now receiving orders for these guns, and due notice will be given in this paper when they are ready for delivery.

The following is our scale of prices: Special Maga- zine for large game, carrying from 3 to 8 cartridges, 70 to 85 grs. of powder, 350 to 400 grs. of lead, 8 to 10 lbs. weight, from \$60 and upwards, according to finish. Special Long-range Magazine Rifle for Creedmoor shooting, 90 grs. of powder, 480 grs. of lead, carrying 3 to 8 cartridges, weighing 10 lbs., from \$100 and up- ward. Magazine guns for general use, carrying 3 to 9 cartridges, 60 grs. powder, 350 grs. lead from \$40 and upward. Single Breech-Loader, Creedmoor shooting, for long range, 90 grs. powder; 480 grs. lead, from \$60 and upward. Single Breech-Loader for general use, 6 to 7 lbs., 60 grs. powder, 350 grs. lead, from \$30 and upward. The calibre of all our rifles, unless otherwise ordered, will be .45-100 in.

For Forest and Stream.
THE OLD FARM-HOUSE DOOR.

BY WAYNE HOVEY.

WHEN memory turns to the days of our childhood,
And fond recollections encompass the view;
When sunshine and shadow each carpet the wildwood,
And fields are all covered with diamonds of dew,
'Tis easy for us in such hours of reflection
To think of the country and home's ample store;
To wander far back, and in sweet retrospection,
Again stand in front of the old farm-house door.

'Twas there that the violets in sweetest confusion,
Nestled close to the path leading up from the spring,
And roses and lilacs in loving profusion,
Bowed 'neath the dip of the swallow's steel wing.
'Twas there that the sunshine seemed brightest and dearest,
And life was a bliss that should never end more;
While the friends that we loved were all dear, yet the dearest
Were those that we met round the old farm-house door.

In the twilight of evening, in the first blush of morning,
When the lowing herd wandered far down in the vale,
And the shrill cock proclaimed his maternal warning,
Awakening from slumber the echoing quail;
No greater delight could be found than in viewing
The teeming expanse of nature's great store,
And breathing the fresh air, so sweet and renewing,
As we stood looking out at the old farm-house door.

In the evening of life, when our days shall be closing,
And the still, solemn night shall be fast drawing on,
When our eyes growing dim—and from labor reposing,
Our arm shall be nerveless, our cheeks pale and wan—
Our prayer is that then, when our Heavenly Father,
Shall make known His will from the bright shining shore,
It may be that us with the good He will gather,
And call us to rest from the old farm-house door.

For Forest and Stream.

From the Potomac to the Rio Grande.

Life on the New Mexico Frontier—Snow-Capped Mountains—Burning Deserts—Dried up Rivers—Rushing Torrents—Mexican Greasers and Apaches.

AS a new sensation to tourists and travelers, we suggest that they put down for their "next" Colorado or New Mexico, and if the trip fails to be remunerative, either in novelty of scenery or incident, it will, in our opinion, be their fault.

Owing to circumstances over which we had no control, we recently very reluctantly took our departure from the National Capital, and turning thence for the far south-west, stopping at Newport barracks to take charge of a detachment of recruits, we resumed our journey, and were soon out of sight of the Queen City and on our way to the "Future great City of the West," which point we reached that night and left in a little while after by special train. The third day found us far beyond Kansas City, out upon the wild prairie; every evidence of civilization, excepting the railroad and telegraph, had disappeared, and instead an unbroken stretch of barren plain met the eye, an occasional band of antelope or herd of buffalo the only animal life seen.

At night our progress was more cautious, necessitated by the fires having in many places destroyed the ties. These fires, caused most generally by cinders from the engines, igniting the sun and wind-dried grass, driven by the unceasing winds, are fanned into a roaring flame, and spread with fearful speed. When seen at night, extending as far as the eye can reach to the right and left one unbroken line of rushing devastation, it is calculated to make an impression not to be forgotten. The fifth day, at dawn, brought us to Denver, surrounded by snow-capped mountains, with an atmosphere of a temperature between summer and winter, clear, cool, exhilarating. We were transferred to the Narrow Gauge Railroad, and proceeded down grade, winding through mountain passes and narrow defiles en route to Pueblo. We had an excellent dinner at Colorado Springs,

which is at the base of the eastern slope of Pike's Peak. At 6 P. M. we were in Pueblo, present terminus of the railroad, 1,950 miles from Washington.

Of the journey so far we can only say that it was smooth and pleasant, a mere excursion, with the addition of a finer climate and a greater extent of scenery than can be enjoyed in any other direction during the winter, Florida not excepted. The change from the chilling fogs and wintry winds of the north west to the balmy atmosphere of the south west, is one of the luxuries of a winter's trip. Few of those who dwell near the shore of the Atlantic have any conception of the delightful climate enjoyed here. Bright sunshine sparkles over the prairie sea and nestles among the declivities of the mountains; the earth rejoices in the generous flood of light poured down upon it from morning till night; the birds of the air and the beasts of the field revel in the groves and pastures that stretch back from the rock-ribbed and snow-capped peaks that pierce the ether blue. Nothing in life or nature seems wanting; all is rich and glowing and full of beauty and promise. The mountains, barren as they appear, are strangely fantastic in form and wonderfully rich in coloring. The full swell of the wind, unobstructed for hundreds of miles, falls like the majestic peal of old ocean upon embattlements of solid rock.

Beyond, beautiful islands of trees loom up over the bright sparkling prairie, barren of foliage, yet picturesque in the tints of the southern horizon, a luxury of lights and shadows, a balmy atmosphere, broad, infinite distances of landscape. One day was required to complete our outfit at Pueblo. At starting the command stood as follows:—Twenty-one mules, three wagons, three dogs, one hundred and thirteen rank and file, one officer. To all contemplating a visit to New Mexico, our advice is to bring with them every thing usually required on a trip through a country far removed from civilization. They will learn after a short expedition that this is an extensive country, prolific in reptiles and the precious metals, exhilarating atmosphere and magnificent scenery, but either or all of which will be found indifferent as means of subsistence. After our departure from Pueblo we traveled slowly for the first few days, that things might get settled into shape. Along the road we saw quantities of geese and quail, and generally succeeded, with our Remington breechloader, in getting a good supply during the day, and at night spread our blankets around the camp fire and lay down to pleasant slumber.

At Chucharas Creek, about one hundred miles south of Pueblo, we very unexpectedly came across the Chief of the Utes, who had returned from Washington, where we had last seen him. He had returned to his people with a fund of wonderful adventures. His account of the antelope, (*Giraffe*), he had seen in the east, that could stand on one side of a fence and eat grass from the other side, was rich; the wonderful feats he had seen performed at the circus astonished his listeners beyond measure. The fifth day out from Pueblo, we passed Trinidad and camped on Rattom Pass, the dividing line between Colorado and New Mexico. On the tenth day we came in sight of Fort Union, and it was with emotions of national pride that we gazed upon the glorious flag of our Union as it swelled out to the evening breeze from the flag-staff that rose above the plain. In half an hour we reached the fort, where we were received with great kindness and hospitality. We had marched two hundred and twelve miles in ten days, and we were not slow to enjoy the luxury of a bath, a change of raiment, and a Thanksgiving dinner. We remained ten days at Fort Union, at the expiration of which time, all being ready, damages to our transportation repaired, stores laid in, arms and ammunition obtained for the entire command, letters written home, we bade good-by to our hospitable comrades at the fort and resumed our journey.

The second day out we reached Las Vegas, the last village on our road. Here was the jumping off place. Beyond this, for two hundred miles, we were at the mercy of the sands and storms and burning suns of New Mexico. Before us, as far as the eye could reach, stretched vast

deserts dotted with mesquit, sage, grease-wood and cactus, and distant ranges of mountains ragged and barren, the head waters of the Rio Peacos. This wild stream of the desert, along the banks of which we traveled, flows in a south easterly direction for over seven hundred miles, through south-western Texas, across the Llano Estacado and empties into the Rio Grande. A glaring sand bottom, through which, in shallow veins, the bitter alkaline water coursed, leaving here and there patches of quicksand; resting places for water fowl. The smallest of the species of sandpiper were here in numbers. Desert mesas, sand bottoms, and arroyas formed the characteristic features of our journey down the Rio Peacos for two hundred miles. The redeeming feature of this lonely and seemingly barren country was the abundance of wild game peculiar to the southwest. Bands of antelope were in sight daily; an occasional deer was seen. We started up coyotes from every arroya and cañon. If we did not feast upon milk and honey we certainly lived on very good substitutes, which were seasoned with that camp luxury—good fat pork, spiced with excitement, and relished by daily exercise. One hundred and seventy miles from Fort Union, and thirty miles south from old Fort Sumner (abandoned), we enjoyed the excitement of a buffalo chase, and succeeded in killing two bulls after a long run over arroyas, sand hills and cañons; it was a mad, wild race for miles, but fortunately they took our direction, and as we had partially committed ourselves to a hunt, should any buffalo appear, no restraint was placed upon the command when a small herd of seven crossed our road. Judging from the observations overheard in camp that night, "the recruits didn't want any more buffalo hunting!"

It was with a sense of relief that we approached the Rio Hondo and left behind us the turbid, sickening, milky alkaline waters of the Rio Peacos; nor will we soon forget our experience of its quicksands and currents, its barren mountains and stretches of sand deserts, where the blaze of the sun, the unobstructed sweeps of the winds across the distances immense, and all the associations of this wilderness impressed us most painfully. It was with more than pleasure that we departed from a region of robbery and assassination. The land of the Apache and Coyote, where the bones of the dead are seldom left to tell the tale; where every cañon is a natural fortification, and every chapparal and clump of thorny cactus a hiding place for an enemy. Farewell, and may it be forever, to your burning sands and savage race, where the silence of utter desolation reigns supreme! Upon reaching the Rio Hondo, a beautiful mountain stream full of trout, and the winter home of great numbers of aquatic fowl, our course was changed from southeast to due west, and for one hundred miles we followed up this peculiar brook. Owing to the great fall from its source in the Sierra Blanca to where it mingles its translucent waters with those of the muddy Peacos, it has cut its channel far down below the surface of the narrow valley of the same name, which it follows. Seen at a short distance it would not be supposed that the ragged line of small brush visible marked the course of a rushing mountain stream, but upon inspection you find this brush to be tops of trees, and below, forty feet in some places, between narrow and abrupt banks flows the limped waters flecked with sunshine and deep shadows; a delightful change from the inhospitable desert left behind. The Sierra Blanca and El. Capitan, seen from the point of junction of the Rio Hondo with the Rio Peacos, appear isolated peaks rising from the plain, and present prominent and picturesque black landmarks for one hundred miles; the Capitan, as midnight; the Sierra Blanca white with snow.

Our journey up the Rio Hondo was as pleasant as could have been desired. The weather was, as usual, quite delightful—soft, balmy sunshine during the day; clear and frosty at night. It was a perfect luxury to breathe such pure soft air as we enjoyed in the middle of December, when our friends in the northeast were freezing amid the ice and snow of a northern winter.

As we advanced up the valley of the Rio Hondo, each

shifting scene developed its peculiar beauties. Mountains arose abruptly on either side, hedging in the narrow way, in some places there being barely space for the wagons between the bank of the Rio Hondo upon one side and the rocky wall upon the other, the one murmuring a song on its way to the sea—the other towering majestically in silence above. The glorious sun-rises were only equalled by the lovely sun-sets. A land to delight the painter and drive mad the poet. Ye who love the haunts of nature, come to the valley of the Rio Hondo and be happy. We arrived at Fort Stanton on Christmas Eve and were well prepared by our long march to enjoy the hospitality of our army friends, and right royally did we feast; forest and stream had contributed to the occasion twenty black-tailed deer, over one hundred wild turkeys, geese, duck, curlew, and trout in great abundance.

We had hoped that this would be the end of our march, and had planned several hunting and fishing excursions, when we received orders to proceed on to the Rio Grande, one hundred and sixty miles south-west, via the Mal Pais Desert, known by some as the "White Sands." These sands are white as drifted snow; they extend for forty miles from north to south by ten to twenty east and west; they are a series of mounds or low hills ranging from twenty to one hundred feet in height. They are disintegrated gypsum, as you will see by the sample I send you by mail. The Sierra Blanca and Sacramento Mountains extend north and south, on the eastern side of these sands, the San Andres and Organ Mountains on the west.

The second day from the Mal Pais Desert we passed between the San Andres and Organ Mountains by San Andres pass, and the evening of the same day arrived at the Rio Grande, two thousand seven hundred miles from Washington, seven hundred and thirty-five miles marched from the terminus of the railroad in thirty days. ORVILLE.

[The sample of gypsum is before us, and as we contemplate its yielding gritty nature, affording no foothold on the weary march we can appreciate the toil of that forty-mile journey, and also the painfulness to the eyes, of the glare that must render frequent applications of damp powder to the nose necessary to prevent blindness.—ED.]

For Forest and Stream.

LAND LOCKED SALMON.

THE GRAND LAKE STREAM.

BY your request I will give you the result of our trip to Grand Lake Stream. My intention was to extend the trip to the Provinces, but finding fishing so entirely satisfactory at Grand Lake Stream, I did not hanker for any better sport. We left Boston May 25th, going by rail to Calais, Maine. There learning that Mr. W. W. Sawyer, Superintendent of the St. Croix Railroad from Calais to Princeton, had this season placed a small steamer on Big and Long Lakes, to run in connection with the P. M. train to Gould's Landing, where Grand Lake Stream empties into Big Lake, I called on him and he at once made arrangements to make a special trip the next morning. We took an early start by the first train to Princeton, reaching there a little past eight o'clock, and the landing about half-past one, P. M., having had a splendid run up the lakes, favored not only with beautiful weather, but by the company of Mr. Sawyer himself, together with two ladies of his family. We found Mr. S. obliging and courteous, and to say that the ladies were not agreeable and entertaining, would be both ungallant and untrue, and we acknowledge our obligations.

The usual preparation and delay in pitching tent left only a short time for fishing that afternoon, May 27th, but enough, however, to kill a dozen or more salmon before sundown. Our party, by the way, was made up of Mr. Alfred Rowe, of Springfield, Massachusetts; Mr. Walter S. Barnes, Somerville, Massachusetts, and myself. The first two named never before trailed a fly over the Schoodic waters, and were highly delighted at the good opening of their first campaign at Grand Lake. I have little doubt that they were playing salmon (in dreams) all night, judging by the broad grin on the countenance of one of them, and the almost boisterous laughter with which he was convulsed while handling and witnessing the "leaps" of his first salmon. Fishing improved and our scores increased every day.

One morning, on learning that the gates were not to be hoisted that day, I said to Joe, my guide:—

"Joe, do you think there will be any one fishing down to the little falls to-day?"

"No," said Joe; "don't think anybody will be there to-day."

"Why, said I; can it be possible that among so many anglers as there are here, there will not be some one or more who knows there will be good sport at the little falls to-day, with the gates closed and no logs running?"

"Well I guess nobody down there," said Joe.

"Why not?" said I.

"Nobody here, (meaning among the Indian guides,) like lug canoe," replied Joe.

"Oh, I see," said I; "you mean all the other guides here are too lazy to carry their canoe down there."

"Yeas," replied Joe, laughingly.

"I think I can do some execution there without a canoe, I said."

"Can't do much without a canoe," said Joe.

"Well said; and do you want to carry yours down?"

"Yeas," says Joe, pleasantly.

"We can have good sport there you think, Joe?"

"Oh yeas, good sport there with canoe."

I felt as confident of that as he did, but wanted not only to have him confirm my belief but to see how he felt about carrying down his canoe, a distance to carry of over a mile. I knew from the way he spoke he was glad to take his canoe down if he could by so doing, give me a good day's sport. Now I did not think it worth while to lug a canoe so far if the chances were more than even that there would be others there, but I knew I could place great reliance on what Joe said. Joe can speak volumes in one word. If he mars the English language he never wastes it. I think I have seen a more demonstrative display of affection between Romeo and Juliet than I should imagine could possibly take place between Joe and his, "or any other fellow's" squaw. He will never be brought into tribulation by his gossiping. He goes straight at the point in speaking. I shall never forget when once we were together I asked him to paddle me into a little deeper and more rapid water, and when there I insisted on sitting up on the cross bar of the

canoe. Joe looked me calmly in the face, and with a gravity and waggishness, for which he is noted, asked: "Can you swim?" I never comprehended three words quicker and better than I did those three. Accordingly, I lost no time in replying that swimming was a part of my early education, and immediately dropped into the bottom of the canoe. I had learned that 'twas useless to argue with him.

As I was saying, I can rely on him. I have tried him well. We have tented together five seasons. We have been in the middle of Grand Lake in a heavy north-easter, with a full sail up in the canoe, when it looked scary, and when one of the guides himself looked ominous, and when our canoes shipped many a heavy roller, drenching some of the party, (ask Prouty.) We have camped on an island for the night, to find, on awaking, our only paddle gone, and "nary" a board with which to make another, anywhere to be found. Another guide, by mistake, had taken it with him on his departure the evening before. This was no joke, judging by the strange mixture of languages and worse grammar Joe used on that solemn occasion, in which it is more than probable I joined. We were in a hurry to proceed on our journey. We were entirely surrounded, not so much by pleasing incidents and circumstances of travel, as by water. We could both swim some, but that wouldn't do.

One may be mad clear through, and get resigned in a measure, because he can't help it. Such, I think, was Joe's condition, and I felt like a politician when he says "he is in the hands of his constituents;" I was entirely at Joe's service. But he proved equal to the emergency again, hewed out a cedar paddle and we were soon on our journey again. But I see I am drifting away from Little Falls. After breakfast I said to Joseph, and if we have good sport, "you shall be a Bishop Joseph." Our canoe was lightly set upon the pool just above the falls at 8½ o'clock. Sure enough, as Joe predicted, no one was there. What a privilege! To be alone on such a splendid pool, with none to foul you in casting, and no pork-slingers slashing round—enough to frighten the spots out of the fish. We had scarcely got pushed out into the current, my leader had not measured its length on the water, before a salmon took n'y leading fly. He fought well and was landed, when a third or fourth cast took another, and he made my reel sing lively, doing some smart jumping before surrendering, when he proved to be like the other, a male fish. I saw at once there was game as well as music in that pool. We would scarcely get out into the current before Joe had to paddle slowly ashore out of the current to land my fish, and in this way I took nine males in succession, all about the same weight and of a dark, greenish color, all of which were the gamiest fish I ever handled on the Schoodic waters. Then came along, now and then, a female fish much fatter and brighter color than the others. I am certain that the fish in that pool were the smartest I had ever seen. Why, I cannot say. They seemed to vie with each other in seeing which could leap the highest. One among them deserves not only freedom, which he got, but special mention here. After hooking him he made two such brilliant dashes and leaps, running full sixty feet, that he thrilled my very nerves, and convinced me that he "meant business," and to become master of the situation if possible. He made one more run, ending in a leap, which almost startled me and brought forth from the stoic Joe an expression of wonder and satisfaction. It was a different leap from any I had ever seen before. Now, in telling this, I don't forget that more than half of the fish stories are not credited, except with being inflated. I don't forget that I once attended a Sabbath school. I don't forget that that "noble chocolate colored man," Joe, was witness to the contest and can be interviewed relating thereto any time; neither was I excited. He came out of the water much as a frightened duck does when rising to fly, making very much the same splash or sound, only instead of being head first he appeared to me to go sidelong and at an angle, which left him at the terminus of his leap at least five feet high in mid air, making a jump after coming to the surface of fifteen feet sure, nearly going over the falls, and freeing himself. That fish was a success, either as a jumpist or as a lively and accomplished performer on "leaders" and fly tackle. I should say that an honest pair of scales would accord him three and a half pounds. I played and landed several more, all of which gave lively satisfaction; and when a quarter to one o'clock we heard the whistle, (desiring to ride home on the express,) I ceased fishing and counted up and found the score to be thirty-nine, and no small ones among them. That part of the day not employed here I fished around the dam and took sixteen, making my whole catch for the day fifty-five salmon. From that day I lost interest, not fishing with that zest and keen relish I had done before, it being almost a matter of indifference to me sometimes whether I landed the fish I hooked or lost him off in playing, believing half the sport to be in the rise.

The day before leaving I fished below the tannery, telling Joe I should not keep over one dozen or one and a half dozen, and when I had reached that number and began to put back all I got after, Joe scowled (I had returned many before) and twisted uneasily, but being "boss of that job" I continued until I had taken in all twenty-three, returning seven to the water to live and be happy, or make some other sportsman happy.

"It was here," says Joe, "where you took eight pair one day two years ago;" and Joe knows.

The following day, June 5th, I broke camp and started homeward, my companions having preceded me a few days; therefore, I cannot give their full numbers, both having had, like myself, excellent sport and good success, Mr. Barnes having killed, the day before he left us, sixty salmon, the largest number taken by any one in our party. My record was for the eight days, two hundred and three, not counting the little yearlings of course. Of my two hundred and three fifty were returned to their native element. I will say here that I took all but one of my fish with a fly, nearly or quite all around me using bait for the first two or three days. Of the one hundred and fifty-three I killed, and many more Mr. B. and Mr. R. took, we did not consume at our camp more than two dozen, the rest, after Mr. B. taking home with him to our Boston friends about seventy-five, we gave to neighbors, from whom we had received favors, and to our guides, not permitting a single fish to be wasted. I mention this because I am often asked what I do with so many fish, besides, many hearing of so large a number being taken, might suppose our principal object was slaughter. Such is not the fact, our whole party being unanimous against such wickedness. I left Grand Lake two days earlier than I should have done,

more by reason of entertaining some compunction of conscience against what seemed to me almost slaughter, than because of becoming satiated with that kind of sport, although I must say that since the day I bent my first pin hook into shape, attached to a piece of twine, bare-footed and bare-headed, I crept cautiously on to the old rickety decayed log-bridge, spanning the little brook near the old homestead, and fiddled my line down between the sticks and experienced my first "tug" at the line, landing my first trout, (I didn't use a pin hook after that,) and proudly marching home with my trophy in hand, down to this last trip, I have never approached so near being satiated with fishing as now.

I never expect to enjoy such fishing again at Grand Lake. It seems to me only a question of time when these beautiful fish will become scarce, unless some further protection is given them. Would it not be a good way to have enacted a law limiting the catch per day by any one person, say not exceeding two dozen, and to fly and bait fishing? Indeed it would not lacerate my feelings to see such measures taken as to insure good fishing there for all time. It can easily be done. It is my honest conviction that all persons who are actively engaged in the propagation of food and game fish, and the procuring of enactments for their protection, are public benefactors.

In closing I may say that on my way home by the short route up Grand Lake, Junior Lake and Stream, Duck Lake and Stream to Carroll, thence by stage to Lincoln Station on E. & N. A. Railroad, I stopped over one day at Springfield, and by driving ten miles to where I struck the Basakahegan Stream near the dam, I took over twenty pounds of spotted trout, averaging over a half pound each. Thus ends a most enjoyable trip. R. R.

Boston, June 22, 1874.

For Forest and Stream.

WOODLAND CARIBOO, OR AMERICAN REINDEER OF NEWFOUNDLAND.

THE interior of Newfoundland is an elevated tableland, not less than 2,000 feet above the sea level in some parts of the northwest, but lower in the southern portion of the island. This savanna country has a surface soil of fine black compact peat mould, formed by the growth and decay of mosses, and covered uniformly with their wiry grass. The plains are in the form of extensive gently undulating beds, stretching northward and southward, with running waters and lakes, skirted with woods lying between them. "Their yellow green surfaces," says Cormack, the only traveller who has crossed the island, "are sometimes uninterrupted by either tree, shrub, rocks or any inequality, for more than ten miles. They are chequered everywhere upon the surface by deep beaten deer paths, and are, in reality, magnificent natural deer parks, adorned by woods and water. The trees here sometimes grow to a considerable size, particularly the larch; birch is also common. The deer herd upon them to graze."

It is remarkable that neither reptile, serpent nor any noxious creature is known to exist in Newfoundland, although these are common in the neighboring continent and islands. But bountiful nature has been liberal in stocking the island with noble herds of reindeer, finer than those of which Norway and Lapland can boast, specimens of which are found at times to weigh six or seven hundred pounds. The vast number of deer paths which, like a net work, seam the surface of the interior in all directions, show that the number of deer must be enormous. Their great enemies are the wolves, which are continually chasing them from place to place, especially during the winter months, when the deer leave the mountains and come to the plains below to feed on the "browse" of the birch. A few settlers who are in the habit of deer stalking, go into the hills in pursuit of deer about the middle of September, which is just prior to the rutting season, and consequently at a time when the stags are in their best condition.

The migrations of the Newfoundland reindeer are as regular as the seasons, between the southeastern and northwestern portions of the island. The winter months are passed in the south, where "browse" is plentiful, and the snow is not so deep as to prevent them from reaching the lichens, amid the lower grounds. In March, when the sun becomes more powerful, so that the snow is softened by its rays, permitting them to scrape it off and reach the herbage beneath, the reindeer turn their faces towards the northwest, and begin their spring migration. They do not move in large bodies, for in that case they could not graze freely, but in herds of from twenty to two hundred each, which are connected together by stragglers or piquets, the animals following one another in single files, a few yards or feet apart. The whole surface of the country is now alive with the deer, as herd follows herd in rapid succession, each led by a noble stag as tall as a horse, and all bending their course, in parallel lines, towards the hills of the west and northwest. Here they arrive from the middle to the end of April, and amid the rocky barrens and mountains, where their favorite mossy food most abounds, they browse till October. In June they bring forth their young in these solitudes, where they meet with a profusion of mountain herbage, and where, as compared with the lowlands, they are free from the persecution of flies. So soon, however, as the frosts of October begin to nip the vegetation, they turn towards the south and east, and repeat their long march in the same manner, and pursuing the same paths as when on their northern migration. Thus for countless centuries, it may be, have these innumerable herds been moving along the same route, unless when interrupted by the Indians or the irregularities of the seasons. Their movements are generally in parallel lines, unless where the narrow necks of land, separating lakes, or the running waters or straits uniting them, or intervening chains of hills cause them to concentrate on one point. It was at such points that the Beothics, or indigenous Red Indians, were accustomed to wait for the deer, and slaughter them in great numbers. Not content with this, however, they erected deer fences, the remains of which can still be traced for many miles. Inland from Notre Dame Bay and far to the northwest of Red Indian Lake, a double line of strong fence was put up by the Red Indians, which at its commencement diverged many miles. The southern fence ran down to the lake, so that deer should thus come near their own encampment; and the northern line of fence was to prevent their escape near the shore. The northern fence ran down to the River Exploits, along the bank of which another fence was raised, with openings at particular

places for the deer to go to the river and swim across. These openings were called "passes." A number of men now go within the fence, and from the wider enclosure they drove them to the narrow part, or to passes of the river where others were stationed, and thus killed the deer at their leisure. These deer fences are actually seen to extend thirty miles on the River Exploits, and how far into the interior no white man can tell. They are formed by felling trees, and must have cost immense labor. The tribe which constructed them originally must have been numerous and powerful, though now without a single living representative.

The Indians, especially the Mic-Macs, have another method of capturing the deer, which if it were not well attested, would seem almost incredible. Some of these Indian hunters will actually run down a stag. Only when fat is the stag worth such an arduous pursuit, and then only is he liable to such fatigued exhaustion. The hunter will commence the chase early in the day, and follow it up without intermission, and before night will make the stag his prey without firing a shot. The stag at first easily outstrips his pursuer, but after a run of four or five miles he stops, and is by and by overtaken. He lies down fatigued but is again surprised; and thus the chase is kept up until the poor stag in despair of eluding his pursuer, plunges into a pool or morass to escape, where he soon meets his doom, man at length winning the day.

It is remarkable that the horns of the cariboo vary more than those of any other species of deer, in fact no two adult stags have horns precisely alike. Some very remarkable horns are to be seen in St. Johns, N. F. One pair is so lofty that when reversed on the shoulders of a man five feet ten inches in height, the horns touch the ground. Another pair has thirty-two points, including those on one brow, another which is palmated, while the other is a mere snag. These horns with just sufficient skull left to hold them together, weigh thirty-two pounds. Others are perfectly straight and have the brow-antlers of similar form. The cariboo is noted for its tenacity of life.

Some years ago, a barbarous practice was in vogue among the half-French settlers who then occupied the Bay of Islands on the western coast. The cariboo in their southern migration, were in the habit of swimming across a narrow part of a large lake called Deer Pond, on the banks of which, at that season, were hidden both men and canoes. When a herd had entered the water and swam sufficiently far to admit a pursuit, the canoes were hastily launched and the chase began. On coming up with the deer, knives were drawn and deep gashes made on the rump of each deer to ascertain which was fatest, and these were instantly killed with the tomahawks, while scores of wounded and bleeding animals were allowed to escape. The slain, perhaps sixty or seventy in number, were then collected and towed to the River Humber which flows from Deer Lake to the settlement, some fifteen miles, and then into the sea. As the Humber on this part has some rapids and cascades, it does not admit of canoe navigation, and the deer were consequently allowed to float to the settlements, where half never arrived; and many of these that did were carried by the current out to sea. The savage cruelty of these hunters met with a just retribution. The deer forsook the route entirely, and now migrate by a path far in the interior, where the cruel hand of man cannot reach them.

On the western coast a smaller species of deer is said to be occasionally seen by the settlers and is distinguished by the name of "little black-legged deer." They are supposed to be the "Barren Ground Cariboo," or *R. Greenlandicus* of the naturalist. A fat stag of this species does not exceed in weight an ordinary doe of the woodland cariboo.

The intelligent traveller, Cormack, who crossed the island in 1822, remarks in his "narrative" that these natural herds are the best adapted for this climate and pasture; and he was of opinion, on witnessing their immense numbers, that all that is required to render the interior, now a waste, at once a well stocked grazing country, could be done through the means of employing qualified herdsman, who would make themselves familiar with, and accompany these herds from pasture to pasture, as is done in Norway and Lapland with the reindeer there, and in Spain with sheep. When taken young these deer become very domestic and tractable. Were the intelligent resident inhabitants of the coast, who have an interest in advancing the country internally, to adopt a plan for effecting this object, under their own vigilance, benefits and comforts, now unthought of, could be realised. How useful the tamed reindeer might become to the Newfoundlander may be imagined from what we read of the Lapland reindeer. It can draw a sledge over the frozen snow at the rate of twenty miles an hour. To the Laplander the reindeer is everything; and in his cold and barren country, covered with snow and ice nine months of the year, and producing few vegetables, he would perish were it not for the milk and flesh of the reindeer. These useful creatures are mostly in a domesticated condition, about four feet high and the same in length. A pair of them will travel in a sledge one hundred miles in twenty-four hours. To their acuteness of sight and smell their master trusts his life in the most dangerous paths during the darkest nights of his stormy winter, and it is seldom that he has to regret his confidence. Their flesh is eaten either fresh or salted, their skins form tents, clothing and bed covering, their sinews thread for sewing, and their tongues are a well-known article of commerce. What has been done in Lapland in taming these creatures could be done equally well in Newfoundland and on a far more extensive scale.

For Forest and Stream.

BLUE MOUNTAIN LAKE, ADIRONDACKS

Café Hathorne, June 15, 1874.

ALREADY has the winter of our discontent yielded to glorious summer in these parts, and the faithful tide of tourists and sportsmen is setting in toward the woods. Doubtless from now till November snows will your desk, drawers and basket be filled with letters concerning the delights and joys here experienced. We do not know of any easier or more accessible entrance to the North Woods, especially to the New Yorker, than the route we have taken and always take, no matter at which point we may eventually aim. Leaving Albany at seven o'clock in the morning on the Rensselaer and Saratoga Railroad we connect at Saratoga with the Adirondack Railroad, reaching North Creek, its northern terminus, at about noon. Thence by stage to Dick Jackson's, a distance of nineteen miles, where we spend the night. This is the last place on the

route where one can experience the comforts of a good hotel, although there is soon to be one opened at Wakely's on the Cedar River. Bright and early the next morning a buck-board wagon will take us to Blue Mountain Lake, a distance of twelve miles, over a road which has never been submitted to the process of Macadamization. You remember it was one of Macadam's theories that a bog was preferable to a hard bottom in constructing his roads. There is plenty of substratum of that nature here.

At Chauncey Hathorne's shanty will we find a smoking hot fish-chowder in thirty minutes after we tear ourselves off the buck-board, and, in fact, it were no bad idea to consume a goodly portion of this time in gradually performing this operation. About twenty minutes is the average time allotted for accomplishing this in safety. A couple of rods from Chauncey's own camp, lies the one reserved for guests. It is dry and comfortable, with the beds aired plentifully during the day and nicely made with fresh hemlock boughs at night. He expects to have quite a log house built by the first of July, in which ladies can be accommodated, and to this end has engaged the services of one of the first architects of this township with a competent corps of assistants. He says it will cost from sixty to seventy dollars and may hug one hundred before it be finished. Now that we are speaking of Chauncey, we might as well say something more of him as landlord, guide and good fellow. He has been located here for the last thirteen years, and of late has wintered as well as summered here. In that time he has caught several trout, and tradition says, seen a fawn or two. His greatness as a landlord has been thrust upon him. Living in the woods first for his health, he grew fond of it and remained for fun. Now his fame as an entertainer of the sportsman has become so widespread that he continues his wood-life for business. He is still young, strong and gentlemanly in language and decorum.

His shanty is situated on the eastern shore of the lake, with a most beautiful sand beach before his mansion. Back in the woods a piece is his ice house, in which is always to be found a supply of fish and game—in season, of course, for Chauncey, although neither a fish commissioner nor game constable, is still very hostile to any interference with fish or deer out of season. He may be a little clouded in his "resuscitative faculty" as regards the exact limits of the seasons, but that's all, and the poor fellow keeps no almanac. He has been so long in the habit of doing his own cooking that he excels in the art. His knowledge of this region is complete. He knows just where every trout has his abiding place in all times, and more than one tree in the neighboring forests has an auger hole in it bored by him. He is likewise considerable of a "schollard." When one finds in a hunter's cabin such books as "Pascal's Thoughts" next to "The last of the Mohicans," "Junius' Letters" sandwiched between "Young's Night Thoughts" and the FOREST AND STREAM, one regards the possessor as a man of profound and varied reading, and such certainly would we have regarded Chauncey, but for a copy of "Paradise Regained" which lay in one corner of his cupboard. That was too much! "Pascal?" Yes. "Young?" Yes. But "Paradise Regained"—never. The dying man, who asked his chief legatee if he had ever read "Paradise Regained," and, receiving an affirmative reply, immediately disinherited him, understood human nature. He knew no man had ever read it. However, Chauncey does read, and occasionally also bestows upon the public some wood-knowledge in the shape of letters.

We perceive we have rather shuffled together our remarks on the landlord and the man, but, after all, we have known several landlords that were men. Nor do we regret speaking so fully of Chauncey and his beautiful home, for we believe that in all these woods there is no better guide than the one, nor more satisfactory camping ground than the other.

This lake, we think, is destined to be the great point of interest in the Adirondacks. From it one can go by water to almost any desirable point. It opens into Eagle Lake, where Austin, another entertainer of sportsmen, lives in the house built by Ned Buntline. Here is buried the latter's wife, although one looks in vain for marble slat or wooden stick. A tiny island in the western corner of Blue Mountain Lake is pointed out as the spot where Ned was wont to hatch his blood and thunder stories.

Eagle Lake, which is a mile long, opens into Utawana Lake, a very pretty sheet of water some three miles long, and a favorite haunt of the deer. Within a week we have seen a number on its southern shore. Below this lake we have Marian River and then Racquette Lake. From Blue Mountain Lake to Long Lake there is a more direct route with four miles of "carry," but even the guides when traveling light, will take the longer and all-water route. The trout in these lakes are very abundant and large. We caught one on the 6th of this month that weighed 11½ lbs., and a day or two before a gentleman secured one which only fell half a pound short of our weight. The flavor of the trout in this lake is superior. A little north of Blue Mountain Lake is a little pond literally filled with brook trout, and they respond most quickly to the fly. We took one that weighed three and a half pounds. A plain, brown hackle was the executioner. In the lakes trolling alone is in order. The season here has been very backward. The ice only went out of the lake on the 15th of May, and a considerable pile of snow remained to see the month out. For the next two months the fishing hereabouts will be very fine. In the fall there is no spot in the Adirondacks where deer and partridges are more plenty. Chauncey can point out to you the place over yonder, on Panther Mountain, where the deer "yarded" last winter.

If we have been too early for good brook fishing, we are just in time for black flies. They are as busy as the little bee, but tar and glycerine make their trade somewhat dull. Their day will now be soon over and their close season will be devoutly wished for by all handlers of the rod. The interchange of ideas on different fishing and hunting grounds is a worthy one. We all hold some one's spot as superior. Yours may be on the Nepigon; mine here. If you persuade us to test your ground, and we induce you to try our favorite place, we shall both be wiser, if not better. Of course you yourself know this Blue Mountain region as well as we, but some of your readers do not, and to them we confidently recommend it.

BOYD.

—George Dimock of Barnegatt, Vt., has a biddy which is somewhat inclined to be aquatic. She has chosen ducks and geese for her associates, and has been seen to plunge them into water, swim across the pond, come out and shake herself like any old water fowl. In swimming she naturally falls behind in consequence of her feet not being well adapted for paddling purposes.

The Horse and the Conyze.

—On Thursday, June 26th, the racing season at Fleetwood Park Course opened, with a fair attendance. The first race was a dash of three-quarters of a mile for horses of all ages, Minnie Mac, Erastus Corning, Scratch, Frank and Nellie Devoe starting; won by Minnie Mac by half a length. Time—1:17, which was very remarkable time. The second race was a failure. The stipulation being that three horses should run, and only two horses offering, the race was off. The third was a hurdle race, eight jumps in two miles, welter weights. There were six entries, but only two horses, Victor and Cordelia, starting. A beautiful race, both horses coming in together, and making a dead heat. Time—4:03½. In accordance with the very just rule of the American Jockey Club, it being a dead heat, the purse was divided.

—On Friday took place the second race meeting at Fleetwood Park. Weather was unpropitious, though the attendance was fair. The first race was for the Stuyvesant House Sweepstakes. Two mile dash. Four entries, three horses starting, Ransom, Lizzie Lucas and Utica; won by Ransom, beating Lizzie Lucas after a gallant struggle. Time—3:40. The second race was one mile and a quarter for three year olds; four entries, three horses starting, Mollie Darling, Scratch, and Erastus Corning. Mollie ran a waiting race and won. Time—2:14. The third race was a mile dash, four entries, and all the horses starting, Scratch, Mollie Darling, Aerolite and Victor. Scratch came in ahead, winning in 1:45½.

At the Beacon Park Races for horses that had never beaten 2:26; on Wednesday 24th, a spirited race took place. There were four entries; won by Barney Kelly. Time—2:30½, 2:29, 2:28½, 2:27½. On the same occasion, a race for horses that had never beaten 2:39. Best three in five, in harness. The purse was won by Dolly Varden. Time—2:36½, 2:38, 2:33½, 2:35.

—At the Beacon Park Races, Boston, on Thursday last, for horses that had never beaten 2:34, mile heats, best three in five, in harness, there were seven horses starting; won by Lady Mac. Time—2:36, 2:35, 2:37, 2:35½, 2:35, 2:39, 2:41. Same day for horses who had never beaten 2:29, five horses started; won by Annie Collins. Time—2:33, 2:33, 2:35, 2:34½.

—At Beacon Park, on Friday last, there was a large assemblage. First race* was for horses that had never beaten 2:40, best three in five; won by American Girl. Time—2:25, 2:22, 2:25, 2:26, 2:25.

—On Wednesday last the opening meet of the Waverly Trotting Park took place, with two good races. The first was for three minute horses, mile heats, best three in five, in harness. Seven horses started; won by Adelina R. Time—2:45, 2:45, 2:42, 2:43½. The second race was for 2:38 horses. Mile heat, best three in five, with six horses starting; won by Eddie. Time—2:39½, 2:41½, 2:40.

—On Friday, at Waverly Park, for horses that had not beaten 2:45, mile heat, best three in five. The race was won by W. H. Farce. Time—2:40½, 2:42½, 2:42½, 2:43½. The second race was two mile hurdles, eight jumps, won by Idaho, eight horses contesting. Time—4:18½. The Consolation Race ended the day; mile heats, best three in five; won by Lady Penny.

—At Utica, on Thursday, the Ladies' Stakes for two year olds was run, Ino, Mattie A. and Nannie McDowell starting; won by Ino in 1:48½. In the one and a half mile race, five horses starting, Katie Pease won in 2:43. For the Hotel Purse, mile heats; won by Springbock. Time—1:45 and 1:42½. On the same day the second trotting matches of the Waverly Park Course took place. The first race of the day was for horses that had never beaten 2:30. Six horses started; won by F. C. O'Reilly. Time: 2:43½, 2:36, 2:40. Second race, for horses that had never beaten 2:50; there were seven entries; won by Adelina R. Time—2:40, 2:42½, 2:42½, 2:42½. The finishing race was for running horses, mile and repeat; won by Gculd. Time—1:52, 1:51.

—At Utica, Saturday, the second annual running meeting took place. From a personal visit we can speak in the highest praise of the excellent character of the grounds and the many notable improvements made there. All the approaches to the course have been put in capital order.

APROPOS OF CREMATION.—An old writer, Bertram, mentioning the customs of the Florida Indians at that time, says: "The dead are placed on an elevated stage till dried up, when a set of elderly gentlemen, with very long nails on the thumb, fore and middle fingers, who travel through the nation, take the skeleton down, scrape the bones, burn the scrapings, and, after painting the head vermilion, deposit the bones in a chest, weep over the remains and then lay them on the shelf for a year. At the end of that period the friends and relatives gather around, take the chest down, weep over it, refresh the color of the head, paint the box red, and then deposit him to lasting oblivion. An enemy and a suicide are considered unworthy such ceremonies."

Now, here is something sensible. Must we look to the despised aborigine for an improvement upon our method? Why cannot we compromise the matter with these cremators, and instead of reducing the whole body to ashes, merely scrape the dry bones and "burn the scrapings"? And only think how much more respectable to be scraped by a decent old gentleman who lets his nails grow long for the special purpose. And how cheering to a dying author to know that his frontal will be red. That, one might call dying for effect. What a consolation to know that your bones, after being wet with the tears of these elderly gentlemen, will be nicely packed in a little red box, and laid on the shelf, neatly labelled, "Bones of Tom Collins—or whoever it may be—departed January 4th; dried and scraped February 6th, painted 7th; to be kept over A. D. January 4th, 1875. Peace to his ashes."

—In our last, when giving the points of certain dogs, the omission was made of crediting the article to the *Fanciers' Gazette* from which it was taken.

For Forest and Stream.

A WORD FROM THE SHAD.

WELL, in spite of all your writing
Tales of how the shad are biting,
Spite of all your angler's lies,
Of Norris rods and yellow flies,
Spite of Chalmers, spite of Prime,
Spite of prose and spite of rhyme,
Still we shad, no new way taking,
Nor our fathers' ways forsaking,
With the hard-worked fishers siding,
Still into their nets are gliding.

At your graceful casts still smiling,
Scorning all your arts beguiling,
Spurning with a curling lip
Each light rod and slender tip:
Be your flies what e'er they may,
Blue or lemon, white or gray,
Still we cry with fishy glee,
Still, "shoo fly, don't bodder me!"
Think! your time for work is short,
Where is all your promised sport?
Where your baskets running o'er
With your captured silver store?
Ah! we hear your baffled cry,
That the rivers are too high;
That too backward is the season;
That, in short, with many a reason
Now you strive to hide defeat,
Not too frankly own you're beat.

Poor humanity! From you
We have learned a lesson true,
And to all the funny race—
As we speak of your disgrace—
We add for all who understand it,
"Don't count your fish before you land it."

ALORA.

Fish Culture.

This Journal is the Official Organ of the Fish Cultur-
ists' Association.

THE ARRIVAL OF THE AQUARIUM CAR
IN CALIFORNIA.

WE are indebted to B. B. Redding, Esq., State Fish Commissioner of California, for interesting facts in regard to the arrival of Mr. Stone and his car, containing the fish, at the Pacific State. Very unfortunately, all the young shad were lost at Laramie. There had been heavy rains on the plains, and the surface water was impregnated with the alkali which had run into the rivers, and so changed their character that the shad were killed. However, as 5,000 shad had previously been turned into the Sacramento River, and as the fish have been known to have returned and spawned, the loss is not a serious one. Out of three lots of shad two have been recovered, and the fact that both Messrs. Green and Stone have each succeeded in getting through a large quantity of this excellent fish, shows how careful must have been the precautions taken by these gentlemen to insure success. All the other fish—salmon, perch, black bass, eels, etc.—came through safely. The lobsters, however, suffered. Of eighty shipped, all died save a dozen, and these were not very lively when consigned to the Pacific. At Ogden, Mr. Stone having telegraphed for salt water, some 550 gallons were quickly sent him by Mr. Redding, who joined Mr. Stone at Winnemucca, just in time to save the salt water fish. At Sacramento, a point having been selected in the river, the horn pouts and eels were introduced into the stream. On the 13th of June the surviving lobsters were launched into the ocean. The Penobscot salmon went to the head waters of the Sacramento River, both Messrs. Redding and Thockmorton acting as convoys. Let us not forget some catfish—humble companions of this long overland trip—which were introduced into the San Joaquin. Mr. Stone's contrivance for aerating the water was a complete success, and by it the transportation of live fish in cans is greatly facilitated. The axle of the cars has a band running over it which works air pumps by means of a simple mechanism. Mr. Stone was accompanied by Mr. W. Green, M. A. Perrin, W. and R. D. Hubbard, young gentlemen from Cambridge, who offered their aid to him. It is not to be supposed that the task Mr. Stone imposed on himself, of transporting fish such a long distance, is an easy one. To be successful the utmost vigilance and no end of hard labor is necessary. We congratulate Mr. Stone, then, and the California commissioners on the fortunate termination of their enterprise.

THE GOVERNMENT APPROPRIATION.—The United States Fish Commission have got to work in earnest, now that the appropriation has passed. The news of its passage was promptly conveyed to the Commissioner, Prof. Baird, who soon had the wires summoning a corps of experts to carry on the good work. The season for shad having closed on the Potomac, the Commissioner made arrangements to obtain fish from the New York shad grounds, near Castleton. Several lots have been transported to other States already, and we hope to give a detailed account of the work when completed.

As soon as the season closes the United States Commission will go to Holyoke for stock.

—It was not quite practicable at first, one day last week, to get near our favorite fish stand, where we pick up many a bit of practical fish lore. First, the rather narrow walk before the stall was crowded by the curious; and secondly, the passage itself was pretty well blocked up by a huge fish fully fourteen feet long from the tip of his nose to the end of his tail. We expatiate on the nose and the tail be-

cause the elongation of the snout was over three feet long, and the tail had a flare of about the same. The fish in question was a fine specimen of the sword fish (*Xiphias gladius*), which, having been harpooned off the coast, was drawing a distinguished audience in Fulton Market. We say an audience of *élite*, for Professor Baird, happening to be in Fulton Market, was attracted by the fish, and we were fortunate enough to receive from him an excellent idea of the sword fish. Professor Baird showed us how the fish was closely allied to the mackerel, having many of the same characteristics. "Cut off the sword," said Professor Baird, "and you will immediately see the likeness." Having then, in an imaginative way, disarmed the fish of his weapon, the resemblance to a mackerel was indeed quite striking. The dorsal fin, Mr. Baird explained to us, or the continuation of it, when the fish is young, extends down to the tail, but in time this is worn off, leaving only a huge fin in prominence. To capture this fish is a favorite amusement down East, where the sport is appreciated and where the fish for food is highly prized. The fish is followed in a boat, harpooned, and the iron of the weapon being attached by a rope to a barrel, renders the capture of the fish possible. Sometimes the fish charges with great violence, and as his weapon is sharp and the fish strong, he can run it through the sides of a boat. In the Mediterranean this fish is much sought after, and Sicilian sailors believe him to be fascinated by a peculiar song, which they chant when approaching him. In Boston and to the eastward the sword fish is very much thought of as an article of food, which shows that Bostonians are much more appreciative of what is good to eat than New Yorkers. We must assert that, having by the advice of Professor Baird secured some slices of the sword fish, we declare it to be most excellent, far better than halibut or any large fish we ever ate. The meat was light in color, delicate in flavor, short in grain, tender and juicy, and better than cod or bass. It is wonderful how much good food we turn up our noses at.

The United States Chief Commissioner of Fisheries, in addressing the Fish Mongers' Association last week, mentioned the fact of our fastidiousness, or how we very stupidly followed gustatory fashions, asking "why we despised sturgeon?" (New Yorkers, with cruel irony, call it Albany beef) the Professor informing the astonished fish dealers "that about the best fish he knew of as an eating fish (we suppose we express ourselves unintelligibly here, and mean to say, a fish for us to eat, and not a fish to eat us) was a nice blue shark, about eight feet long." All we can say is, that we would advise our fish-eating community next time a sword fish comes to market to try some of it, and they will find it admirable eating. The sword fish feeds on fish, and his long sword is used by him to dash into a shoal of fish and to cut up and sabre his food before swallowing it. Mr. Baird explained to us the many weapons fish possessed which are often overlooked, especially two sharp razor-like fins, setting at right angles with the body of the fish, just before the tail, by means of which some fish can slash and rip open other fishes. The rapier of the sword fish, severed from the head, we have now before us; unfortunately about a foot of it he lost in some lunge of his, but it measures now thirty-six inches, and was certainly, when perfect, over four feet in length. His gills were beautiful to a degree, looking when fresh like the most delicate slices of watermelon, only closer grained and more beautiful in their structure. A great error is made in coupling together the sword fish and the saw fish. The latter is a shark.

Natural History.

PINNATED GROUSE (*Prairie Hens*).

PETERBORO, N. Y., June 22d, 1874.

EDITOR FOREST AND STREAM:—

As the question of stocking some localities of our Eastern States with pinnated grouse is being agitated, the following may be of service to your readers:—

In February, 1845, I purchased three dozen of prairie hens, which had been caught in Missouri, and brought on in coops. Two pairs, an old and young I kept, the others were given to persons in the neighborhood, and all, by the way, died. Mine soon became quite tame, as they were suffered to run at large in a grass yard where persons were constantly passing. About the last of March the males commenced tooting. The old hen dropped her first egg on the 8th of May, on the open ground, which I removed. The next two days she spent in the greatest agitation, restless, cackling, and examining every part of the enclosure to select a place for her nest. At last she fixed on a spot at the root of a bush, on the very margin of some high grass, where she scooped out a hollow, and deposited an egg every other day till she laid eight. From the first she was careful to bend the grass over the nest on leaving, and after two or three days she plucked some long blades of grass which she placed on the margin of the nest most exposed. The eggs were of a dirty yellow brown, like a guinea fowl's, thickly splashed with purple spots, and about the size of a pullet's egg. She began to sit on the 25th of May, and six young were hatched on the 20th of June, making twenty-six days.

The male tooted at all hours of the day, from early dawn till late in the evening. While tooting they were the most ridiculous figures possible, less like birds than beasts. They stamped on the ground like men endeavoring to keep themselves warm; rustled with their wings like a turkey cock; raised their tail, expanding it like a fan; lowered their head with the long feathers on the neck standing out from right angles with the neck to perpendicular; and inflated the bare skin of the neck till it was the size of a hulled walnut. Wilson's figure of them in the act of tooting is totally unlike. The head is lowered and pushed forward, as I

have stated, and the inflated membrane is of a flesh color, not orange as he has figured it. He also states that one kept in confinement did not drink, though a cup of water was kept in the cage, but one day water being accidentally spilled on the bars of the cage, it eagerly picked off the drops as they trickled down the bars. Hence he infers that in their natural state this is the only manner they obtain water. Now the fact is they drink frequently, and precisely like the common hen, as I have seen hundreds of times. Indeed, in all their habits they very closely resemble the common fowl.

They feed on all kinds of grain, but I observed when oats, wheat and corn were thrown down together, they first selected the corn. They ate the green blades of grass, the grass seed before fully ripe, and they totally devoured the whole of a small patch of parsley, to the cook's great indignation.

They eagerly picked the buds off all the shrubs in the yard. It was very amusing to witness their attempts to reach the buds on the tall shoots of the rose bushes, which, as they were pinioned they could not readily spring up to. They threw their whole weight on the shoot near the ground, bending it down, when they carefully, foot after foot, walked along it till they reached the extremity.

Wilson describes the tooting pretty accurately. It seems performed by one inspiration, and two expirations *ou-tou-tou*, the two last syllables long drawn out, and the head pushed forward.

Audubon professed to have raised them, and from him, of course, we would expect much more accuracy. He describes them as not only excessively pugnacious with each other, but even as standing several passes with a turkey cock. This may be true, but I never witnessed anything like this amongst mine. One pair of mine were old birds, while the other were birds of the previous summer. Whether it was owing to this fact or not I do not know, but certainly the older bird chased the younger one, who never offered any resistance. The tame pigeons that came to eat their food were never directly attacked by them, but they threw themselves into the most ridiculous attitudes, which had the effect, whether intended or not, to frighten off the pigeons for awhile. I gave a gentleman a pair, and the female died. He then placed a bantam hen with the male, but she beat him till he was compelled to separate them. He states the period of incubation at eighteen or nineteen days, and mine, as I have stated, sat twenty-six.

The young would readily be taken at first sight for young chickens. They were much more active, however, and seemed quite independent of the parent, seeking their own food very industriously. I never observed the female call them together when she had found food, as the domestic hen does. They seem to seek for insects amongst the grass, and I have often observed them, when but two or three days old springing up to pick off something from the tall blades of grass.

THE SPECIES *Megalops thersoides*.

SPRINGFIELD, MASS., May 29, 1874.

EDITOR FOREST AND STREAM:—

I notice an interesting letter in No. 16 from S. C. Clarke, of New Smyrna, Fla., in which he speaks of tarpon, jewfish, &c. Last winter I made a cruise down Indian River, out Jupiter Inlet, and outside to Biscayne Bay, spending about a week there and going up into the Everglades with young Tiger Tail, (son of old Tiger Tail, whom I also saw) then on in the same boat, among the Florida Keys and to Key West. The boat was the "Wig Way," Captain Saunders, of Miami, 18 feet long, 9 feet beam, schooner rigged, all decked over, and a most excellent sea boat she was, as we proved in running out of Jupiter, through three lines of breakers some ten or twelve feet high. One morning while at Sand Key, Saunders and I took the dinky, a little keel boat, very light, and he taking his grain and pole, we started for tarpon as I always heard them called there. He poled along in about six or eight feet water, and we saw several but did not get near enough to strike. At length throwing his pole at least thirty feet he fastened to one. The pole, of course, came loose; he handed the line to me, and I had about ten minutes of very exciting sport. The fish towed us in all directions, but at last became exhausted and we lifted him in. He was 5 feet 6 inches long, 13 inches deep, back dark green and blue, sides and belly perfect silvery white. I send you a tracing of a rough pencil sketch I made on the spot, and one of his scales. Not being a scientific ichthyologist I did not make a detailed description, and have tried in vain to find the true name. Can you give it? The last ray of the back fin is very much prolonged, as you see by the sketch. I have it in my possession. The flesh was dark, raw, but white when boiled and most excellent eating. Two years ago I spent some time at Jupiter Inlet and caught a great many bluefish and cavalli. Is the question definitely settled whether the cavalli and the pompano are the same or not? In trolling outside the Florida Reef we caught what are called kingfish; these are very game fish, shaped like a Spanish mackerel, blue and silver colored, weight about 10 to 15 pounds; but I was told often caught weighing 50 pounds or more. Is this the kingfish of New York Harbor? Several of the Indians at Miami had bones and flesh of the manatee, and I saw one alive in the water at Jupiter, but only for an instant. Among the Keys we caught a good many crawfish, almost exactly similar to a lobster, but without claws and with very long antennae as large as medium sized lobsters and very fine eating. Truly yours,

W. H. BURRELL.

TRAITS OF SOUTHERN FISH.

JAMAICA PLAINS, JUNE 10, 1874.

EDITOR FOREST AND STREAM:—

I send you a table of the time and place of spawning of some fishes of the southern coast, procured from an intelligent observer at New Smyrna, E. Florida.

S. C. CLARKE.

NAME OF SPECIES.	TIME OF SPAWNING.	LOCALITY.
Redfish, or channel bass, <i>Corvina ocellata</i> , Cuvier.	August and September.	Shallow bays & inlets.
Sheepshead, <i>Sargus ovis</i> , Cuvier.	March and April.	Mouths rivers & inlets.
Mullet, <i>Mugil lineatus</i> , DeKay.	January and February.	In strong currents, on the surfaces.
Salt water trout, <i>Otolitis Carolinensis</i> , Cuv.	July and August.	In rivers, in salt water.
Drum, <i>Pogonius cromis</i> , Cuv. <i>fasciatus</i> , Holbrook.	March.	In the bays and inlets.
Whiting, or kingfish, <i>Umbra Nebulosa</i> , Storer. <i>Umbra albida</i> .	May.	In the ocean.
Brown snapper, <i>Serranus erythrogaster</i> , Cuv.	May and June.	In bays and inlets.
Grouper, <i>Serranus nigritus</i> , Holbrook.	May and June.	In bays and inlets.
Sailor's choice, scup, <i>Hemulon rubromaculatus</i> , DeKay.	Omitted.	In deep water salt rivers.
Pigfish, or grunt, <i>Microgobius undulatus</i> , Cuv.	April.	In bays and inlets.
Pompano, <i>Bothrolampus pampanus</i> , Holbrook.	March.	In the ocean.
Cavalli, or crevalle, <i>Ca-raus defensor</i> , DeKay.	May.	In the ocean.
Bezug, or spot.	November and Dec.	In bays and inlets.

ALDERMASTON, Reading, Eng.

EDITOR FOREST AND STREAM:—

I observe in your journal of May 14th, that at page 216, under the heading of "Aqua," your correspondent remarks that the sex of goldfish can be ascertained by the length of the dorsal fin. I was not before aware of this, and must pay attention to it the first time an opportunity presents itself. Your correspondent may probably like to know that the sex of carp, tench and pike can be ascertained by the larger size of the ventral fins in the male. I should imagine the male goldfish, as they are classed with carp, would also have the ventral fins large.

Can any of your correspondents inform me how to distinguish the sex in common perch? I only know of one way of doing this, which is at the time of year they breed, to see which are miltrers, but at other periods of the year, I believe there is no difference between the males and females. In some ponds perch multiply so fast that they starve one another and none can attain any size. Where this is the case the best plan is at the proper time of year to select one of the sexes and stock your pond with them. I believe it is better to use the males for this purpose, and they then attain a good size. But this can only be done at a certain season, when the breeding time is coming on. It would facilitate matters if there was some other distinguishing mark. Your obedient servant,

HIGFORD BURR.

CENTRAL PARK MENAGERIE.

DEPARTMENT OF PUBLIC PARKS, {
New York, June 23, 1874.

Animals received at Central Park Menagerie for the week ending June 27, 1874.

One small Alligator. Presented by Robert R. Gibbs, M. D.

One Jaguar, *Felis onca*.

One white-throated Sapsajou, *Cebus hypoleucus*.

One Hawksbill Turtle, *Chelone imbricata* Hab. East Indies. Presented by Mr. Eugene G. Blackford.

Three Military Macaws, *Ara militaris*. Hab. Brazil. Purchased.

One Fawn. Bred in the Menagerie.

There are at present to be seen in the Menagerie a herd of 12 giraffes, the largest number of these animals ever seen together in this country.

W. A. CONKLIN.

Woodland, Lawn and Garden.

THE WISTARIA SINENSIS.

"Fast he stealeth on, though he wears no wings,
And a staunch old heart has he!
How closely he twineth, how tightly he clings
To his friend the huge oak tree!
And slyly he traileth along the ground,
And his leaves he gently waves;
And he joyously twines and hugs around
The rich mould of dead men's graves."

OUR attention was first called to the many meritorious qualities of the *Wistaria sinensis* in the year 1846, since which time we have given our especial observation and study to this always beautiful climber.* Since the time our attention was first called to the cultivation of this hardy climber we have seen many fine plants of the same* growing well and luxuriantly in many of our large cities. One of the finest specimens I ever saw was growing at Thorburn's Astoria Gardens—a remarkably fine flower of the first magnitude.

Taking into consideration the ease with which this fine floral ornament may be grown, we are astonished that more of them are not cultivated. We are glad to know that from the year 1849 to the present time there has been an increasing interest felt in this plant. We have often been told by those enquiring for this plant, and by others to whom we have recommended it, that they could not make it grow; it was a sure failure on their hands.

It is a plant well adapted to use for porticos—to cover summer houses and arbors, and may be seen creeping high up on the front of many of the palatial dwellings of New York and Brooklyn. It is a glorious sight to behold in the early spring mornings in May, when its pendant flowers hang like so many gems, and sparkle in the morning sunlight. It is not only a morning beauty, but an evening delight, when it throws forth its odorous perfume without stint.

A very remarkable property of the *Wistaria sinensis* is that it blossoms before it sends out its green leaves; first the buds, then the blossoms, burst at once upon your sight. Afterwards the glossy, green shining leaves come out, seeming to take the fullest time to develop the whole beauty and perfection of the plant. Being a perfectly hardy plant it may be placed in what are termed the most common situations, and will live and grow well in soils that other plants would shrivel and die in. It may be cultivated in very many ways, and some of them picturesque and very unique. For the information of our readers we shall notice some of the forms and aspects under which this rare climber may give both grandeur and beauty to the palace and the cottage, the garden and the lawn; for under all these different forms of culture have we used and recommended for ornament the *Wistaria sinensis*.

For a large sized greenhouse or conservatory I know of no prettier plant than this, but being a vigorous grower and a great traveller, it always after a good start inclines to progress rapidly on its journey. It would seem to one looking at this plant in situations particularly adapted to its grand development, that like the humble grasses at our feet, whose mission we recognize to be to cover the earth with a carpet of green, so the *Wistaria sinensis* throws its great rambling arms and feelers, like some huge vegetable cuttle, to entwine within its grasp every stray twig it may rest upon. Then, having covered the summer frame of largest dimensions, how it lovingly clings to its mystic support, and fairly laughs in myriads of blue and purple blossoms.

As we have before stated, this plant is not at all particular as to where it is planted. It is one of the few much neglected plants that have learned to take care of themselves, and it has a wonderful adaptation to almost any

*Two ladies, who style themselves "constant readers of FOREST AND STREAM," will find to-day a full answer to their enquiries as to the merits and mode of cultivation of this magnificent plant.

location. I have cultivated this plant as a large shrub and as a pole plant with good success. All that is requisite and particularly needed to have a good plant is to know how to prune it properly. This is done by first choosing a strong cane and tying it up closely and straight to a pole of the height you desire your tree to be. If for a dwarfish tree, your height will be say five feet from the ground; here you will form your head, and you will be careful to remember that in order to have a good tree it is absolutely necessary that this pruning be rigidly followed, and your plant carefully watched. If not, then the experience of all our years of study will prove of not the least benefit to our readers. In this connection I would state if any are too timid to produce a fine *Wistaria* tree upon the lawn (a finer object is rarely seen), they may take a goodly sized crock or pail and commence their work out of sight of the travelling world. Having grown a fine pot dwarf *Wistaria*—which you can do as well as ourself by following the above method—you can sink your pot out upon the lawn in a position where a good background of green hemlock or arbutus will add a new lustre to the pendant flowers of purple and white. The pot culture is very nearly the same as that pursued with them on the lawn.

Why I am particular as to pruning is, that this plant has a habit of its own—a very wilful way of flinging out long arms of quite weak shoots, and these form at a very early period of the growth of the plant. This habit has been the means of the plants being thrown away in many instances as good for nothing. As soon as a layered branch of this plant has become a plant of itself by rooting, as it readily does, from the point of connection with the ground (always make a cut at this point in the layered branch say half way through) it will begin to send out these feelers or tenuous branches which are natural to the plant. Now is your time to determine the future of your tree, shrub, or running vine. If you wish a tree form, prune all those rambles off, until you form a stalk for your tree. Now for the head. Cut off square just above three or four good strong shoots; never leave more than five, and shorten these in to say one foot. Now you will be sure to keep shoots, and all others that spring from them, cut back very closely at least every year, and the first year I have found it well to cut back two or three times in the season. By a similar course of treatment, varying a little only with the desired form, you can have very fine plants for the conservatory, the piazza, and ornaments for the greenhouse and out of doors. It were quite impossible to give you all the descriptions in one or two papers upon this plant, or the fine capabilities it affords the amateur and educated cultivator to produce elegant and valuable specimens of landscape adornments.

As an ornamental plant of the decorative order, I have used the *Wistaria* often and successfully as to capability for suitably accommodating itself to pillars of wood or iron. In fact, anything makes it of great value to every one who loves flowers. In garden use, where an arch can be thrown across a path leading into a grove, or near to a covered seat, I have found that a *Wistaria* on one side, and a fine exotic climbing rose, or even our home prairie rose, made a very beautiful combination and a delight to every beholder. So with a pillar, upon which a bird house for the martens could be placed, at the base of which a rose and a *Wistaria* grow lovingly together, is worth all your time, care, and cash expended. Try it, and you will believe it and rejoice in it.

In treating the *Wistaria*, when it has been brought to the desired form by pruning, develop the bearing shoots or spurs at the height of twelve feet, then such numbers of lateral branches about one foot in length, that when it has reached this state it will bear only blooming spurs; and if by force of growth it should send out a few long branches it will not harm the plant, and they can be removed entirely, or cut back in the spring.

Our friends cannot fail to be pleased with this plant and its cultivation. Why, it is so easy we are truly sorry to hear that so little has been thought of this prince of the boulevards—this pride of the garden. In our next paper we shall finish with the *Wistaria*, and give you some interesting notes, facts, anecdotes, and peculiar modes of potting, dwarfing, treeing, and miscellaneous culturing pertinent to this peculiar and rare plant.

OLLIPOD QUILL.

ANSWER TO ENQUIRIES.—"How shall I protect my rose bed in winter?" To this enquiry of an amateur rose grower, though a little out of season, we answer:—As cold weather draws near, and the leaves of your plants begin to fall, you will carefully cut back all your rose plants (your judgment must now govern your knife), and tie back to a stake all the struggling shoots. Now give the bed a dressing of from three to five inches all over the top, and around the plants, with a compost made from the following articles:—Coarse manure, two parts; forest leaves, two parts; old sod soil, one part; and road sand, one part. Mix these well together, and you will find you not only have a sure protection for the winter, but a fine manure for the spring. When you remove from the bed one half of the above compost you are all right for the next season.

OLLIPOD QUILL.

—The bamboo, generally supposed to be one of the most inoffensive of vegetables, is said to contain a poison which the natives of Java use against their enemies. It is obtained by cutting the bamboo at a joint, and detaching from the saucer-shaped cavity some small black filaments, covered with almost imperceptible needles. The filaments constitute the venom, against which no remedy has been found to act.

DOGS FOR DIFFERENT KINDS OF GAME

IN the discussion of the relative merits of field sportsmen's dogs, which I am much pleased to see has recently received considerable impetus from the very able manner in which the general subject has been treated in your valuable paper, I am disposed to think that it is the duty of every sportsman who wishes the sport well to do what he can to contribute to the general information upon the subject. With this view I will venture some conclusions arrived at, and gathered from the recollections of a constant practice and experience extending over many years, which may possibly be considered of some little value at least to the young sportsman or the new-beginner, or even to those who have not been in a position in their section of country to have seen and compared the different styles of dogs. In my opinion they are really necessary for the different kinds of game which this great country affords in different localities, and even within easy distance of this great city. Woodcock, snipe, quail and partridges, (ruffed grouse,) I am pleased to say are still within easy distance of a day's range, although not quite so plenty as they were thirty years ago, when I used to find English snipe enough for good shooting on this Manhattan Island, and when back of old Rafe Burrow's English Ale House, then on the Bloomingdale Road, now the corner of Thirty-fourth street and Broadway, was a very favorite spot for them. For every sportsman then in this city thoroughly up to the mark in all that pertains to the proper use and management of the dog and gun, there are now, doubtless, twenty. Still, it is with this as with all things else, experience is the great practical educator, and its reminiscences may possibly be of some service to the younger branches of the family. In the general discussion of the different breeds of dogs, and the tenacity with which almost every owner and breeder claims his strain of blood to be the best, I have no desire to enter, nor do I wish to interfere in any way with their different theories and modes of training and breaking. Almost every field sportsman has a way of his own, and so long as it accomplishes the end desired without injuring the natural good qualities of the animal, all is well. I am, however, very much in favor of one dog being kept exclusively for any one designated kind of game, and never allowed to see any other, at least until he is thoroughly broken, if the owner of the animal desires a first-class performer for that especial purpose. In my opinion, therefore, the young sportsman, before taking his dog into the field, should first well consider what kind of game is most likely to afford him the best sport in his particular locality, and if he intends to hunt principally there, and would prefer his dog to act best on that kind of game, then, I say, determine at once that the kind you have selected shall be the first bird shot over him, and that on this particular bird his education shall be finished. Nine times out of ten the bird which a dog has first hunted and had killed over him will ever be his favorite game for the balance of his life.

If for woodcock, brake him on woodcock; if for quail, be careful that the first birds killed over him are quail; and if for ruffed or pinnated grouse, the same; and above and beyond all, if for snipe, the dog should not see any other bird for at least two seasons. There is but one style of dog which can ever attain to any great perfection in a snipe field, and the qualities necessary for that purpose he must inherit naturally, as they can never be acquired by any course of training. They are qualities rarely possessed in any great degree, but to the experienced eye are easily recognized even in a pup. He must be naturally high-headed and have a fast and easy style of going, and disposed to catch the scent upon the wind, taking it at all times breast high, and should never be disposed or allowed to puzzle upon a scent upon the ground; and he should, in my opinion, be kept exclusively for snipe, as the habits of the bird and the style of hunting necessary for a first-class snipe dog is essentially different to that of all other kinds of game. There are but few places, however, where such a dog can show to proper advantage, as it requires just a certain number of birds scattered over a certain quantity of ground to display the dog and bring out the beauty of his performances. There are, however, I should say, two sides to this question, and in very many of the very best snipe grounds where the birds are very plentiful, such a dog would be of no more use than he would be in a woodcock covert in July, and would, unless under admirable control, be a positive injury rather than a service. On such ground an old and steady fellow is the most desirable, simply to mark and retrieve your dead birds.

The ground at Pine Brook, however, and especially the "Big Piece" is admirably adapted for the most favorable display of the great snipe dog, and in fact all of them that I have ever seen, have been; (I think I may say with propriety,) essentially Pine Brook dogs, broken at Pine Brook, kept at Pine Brook, and hunted almost exclusively at Pine Brook. I shot over two of the best of that description for a good many years, and both became to know the ground every inch of it as well, if not better, than I did myself. Whether on Columbia or Black Brook Meadows, or on the Troy or Leonard's Meadows, or on the "Whippany" or Big Meadows, or on "Pine Brook flats," either side of the river, or in the "Horse shoe bend," or the "Big" or "Little" Piece, clean to the lower "swing gate." They were everywhere at home, and knew every favorite spot upon the ground, and would go for it with the most unerring cer-

tainty, showing caution as they approached it, and sure to get on a point if a bird was there. Such a dog, I fancy, would have made short work in a field trial against any unfortunate outsider brought to that ground to contend against him.

If agreeable, some time in the future I may give you my notions of the most desirable qualities of the quail and woodcock dog, of all dogs now in my opinion by far the most useful for first-class sport in this our eastern section of the country.

Yours truly, VERITAS.

THE POT HUNTER.

SHREWSBURY, June 8, 1874.

EDITOR FOREST AND STREAM:—

Have not most of us sportsmen some knowledge of him? Many know him to their cost. If not engaged with the dogs entrusted to his care he generally may be seen in the bar-room or billiard saloon. His dress proclaims his business—coat, cap and pants made of stout corduroy, his pants inside of a heavy pair of high boots, and to the buttonhole of his many-pocketed coat hangs a dog whistle. Keen, cool and collected, with all to gain and nothing to lose, he is one who acts on the principle that the world owes him a living. One whom it is hard to detect in law breaking, and if detected and prosecuted, the party prosecuting generally has the privilege of paying the costs. One whose ill will is not to be desired. One who knows the country for miles around; knows exactly where to look for every bevy of birds; knows on whose farms game may be killed with impunity, and where it is necessary for his companion to keep watch while he takes the deadly shot on the ground, and is cool enough to kill several of the survivors with the second barrel. Constantly in practice, he is a first-class shot, but will not take any doubtful chances at a single bird flying, if he can see it on the ground.

This is the man to be seen at pigeon matches, deep in the mysteries of trapping pigeons, ready to pick up a flat, or sell out a match. He will not work but gains a precarious living through the means of the encouragement he receives in the different professions he follows. The market men encourage him to kill game in season and out of season. Next to the market men he is encouraged by the well meaning sportsmen, who purchase dogs from him, hire him to break their dogs, and in so doing are in great measure responsible for the acts of this class. Where are they not to be found? Is not every section cursed by them? Were it not for this class game laws would hardly be needed, and can it be wondered at if land owners are looking to the passage of laws that will make shooting not a desirable business?

We all have our share of duty to perform in the preservation of game, and in this may we all work together; and to do this it is necessary to form sportsman's clubs, and in the by-laws would it not be desirable to insert a rule requiring members in no way to aid in the support and encouragement of market shooters by purchasing dogs from them or hiring them to train dogs?

The example of all true sportsmen is what is needed. He who is able to handle trained dogs should be able to train them. An ordinary-sized room is large enough to train a dog in. Do not confound training with hunting the dogs.

Brother sportsmen, train your dogs yourselves, and hunt them yourselves, and by so doing you will stop one of the main inducements to shoot game for market.

CHECK CORD.

[We think "Check Cord" has made a very good point in the foregoing strictures.—Ed.]

NOTES ON DOGS AND GAME IN MISSISSIPPI.

A valued correspondent at Corinth, Miss., sends us an interesting letter, from which we take the following:—

EDITOR FOREST AND STREAM:—

Fox and deer hounds here are owned by different parties, but are all from the same stock. They are black and tans, and are good dogs for "hoof" or "claw." The original pair were brought from Selma, Ala., by Major W. H. Scruggs, in 1866, and have been crossed with some other hounds of known good blood. We have nothing here but the gray fox, and we use the same pack to "drive" for deer. A bitch belonging to Mr. W. R. Borroum, of this place, pulled down the deer at the deer chase at Memphis the past spring. I am quite certain that there is not a Laverack in Mississippi. We had here a few years since magnificent shooting. Bob White had multiplied and replenished the earth during the war, and the antlered monarch of the waste sprung from his heathery couch in haste, or got up leisurely, as the exigencies of the case demanded. Mr. *Gallopavo fero* gobbled amatory or grasshoppers, as it suited his fancy.

But the man and brother, liberated from his shackles, soon scraped up \$3 and invested in a pot metal blunderbuss, or an old "war gun." They betook themselves to the woods, they chased the antlered monarch with vile curs, they shot the does at breeding time, they gobbled up the gobbler, the setting hen on her eggs, or killed her and left her unprotected brood. They killed poor little Bob as he sat on the fence in the "gnashing sun, light of a sabbath morn," or any other morn. They "broke up" Mrs. Robert's nest and ate the eggs, and when stormy winter came they trapped Robert, his wife and family, and all his relatives, wherever dispersed. And the white men helped them. And now game is scarce and we have no game law.

R. Y.

Shot Gun and Rifle.

GAME IN SEASON FOR JULY.

Woodcock, *philohela minor*. Squirrels.

Details of pigeon shooting and scores of rifle matches, and other interesting matter, should be mailed so as to reach this office on Tuesday morning in each week.

—Saturday, the 4th, is the first day of the woodcock shooting. Better were it the 15th.

—Woodcock make a fine showing this season in Sullivan and Ulster Counties, and sportsmen are rubbing up their guns.

—Recent reports from the Adirondacks are to the effect that bears and deer are unusually abundant, and fine sport is promised as soon as the season opens. On Moose River an old hunter reports the tracks make the shores of the lakes and rivers look like cow-yards. Last month he counted fifteen deer in sight one day.

—We have been honored for the fourth time by the formation of a new shooting club bearing the name of "Forest and Stream Shooting Club," a new club having just been organized in Philadelphia for the joint object of sport and the protection of game. We accept the compliment with thanks, and wish the club every success.

—We are pleased to notice an organization of riflemen, formed at Plattsburgh, called the Plattsburg Rifle Association. The following are the officers: B. M. Beckwith, President; J. D. Wilkinson, Vice President; Dr. S. V. Howard, Secretary and Treasury.

—An association of gentlemen has recently been organized in Morris county, N. J. under the name of "The Morris County Sportsman's Club," having for its object the preservation of game in that county, and the strict and impartial enforcement of the game law enacted at the last session of the New Jersey Legislature.

The President of the club is Hon. Augustus W. Cutler, of Morristown, State Senator, to whose care and exertions the community are mainly indebted for the passage of that law. The other officers of the club are James Bryce Jr., of Madison, Vice President; Charles H. Raymond, of Morris Plains, Secretary; Daniel D. Craig, of Basking Ridge, Treasurer; Francis Childs, of Morristown, Council; Stephen S. Whitney, of Morris Plains, and E. M. Quimby and Jerome L. Stout, of Morristown, members of the Executive Committee.

The club already numbers over sixty members, and they are determined to spare no proper effort to secure the conviction and punishment of all violators within Morris county, of the State Game Law. Efficient and vigorous measures are already instituted under the personal direction of the Executive Committee to discover and arrest and fine all persons killing or having in possession woodcock before July 4th, and similar means will be adopted for the protection of quail, ruffed grouse and other game during the close season.

The club will also give its attention to the important subject of stocking with quail certain parts of the county where these birds are scarce; and also to introducing the pinnated grouse to the wide heaths and meadows within the limits of their supervision. An effort will also be made to restock with trout some of the beautiful streams near Morristown, and the project of putting the game grayling into some of them is seriously entertained.

The headquarters of the Morris County Sportsman's Club are at Morristown, Morris county, N. J.

—A letter from A. B. H., Peacedale, Rhode Island, says:—

EDITOR FOREST AND STREAM:—

I am happy to be able to say that for years past there has been no such promise of quail (can't we have a national name for it?) as there is this season. The birds have not packed in a single instance to my knowledge, and the call of the male is to be heard in almost every field. They are unusually tame, too, and I could sit and shoot them from my parlor windows, as for some days past they have been strutting over the sward in front of the house as if they were so many peacocks.

WASHINGTON, June 26th, 1874.

EDITOR FOREST AND STREAM:—

In your issue of June 25th you quote a paragraph from the Alexandria (Va.) *Gazette* relative to slaughtering woodcock, and comment on it by saying "if the Sportsmen's Club of Washington feel unable to bear the expense of prosecuting these violators of the law let them apply to outsiders," etc. It is not for the lack of funds that these pot hunters are not prosecuted, but a want of interest by the members in the welfare of the club. We have a few real earnest and energetic men, who are anxious that the object for which the club was organized should be carried out. By our constitution, nine members are a quorum, and we have endeavored since the middle of May to hold a meeting, and cannot secure the attendance of that many members. Our annual shoot takes place in September, and it is now time to commence to prepare for it, in order that it may be a success. It is to be regretted that this organization seems likely to meet the fate of others attempted here, and that after a short spurt it gives up. Our next monthly meeting is on the 13th of July, and we hope then to do something. We do not know of any organization that has a nicer club room.

JAS. N. DAVIS, JR., Secretary.

SPORT IN TEXAS.

GALVESTON, Texas, June 10, 1874

EDITOR FOREST AND STREAM:—

Near Goliad, in Western Texas, last fall a party went out from that town and returned in three days with the feathers of 1,500 geese. The *modus operandi* of catching them was as follows: Corn was soaked in a preparation of alcohol and opium, and then scattered around the shores of the lake, where the geese congregate. After devouring the corn, the geese tumble over and wallow in the mud like any other drunken goose. Well, now, do you think you could eat that goose? Would they live and thrive after their drunk, or would a real experiment have to be made and his gooseship cooked and served to be really known if healthy? Give us your opinion. The past winter game of all descriptions have been a source of plenty in our bay and adjacent islands and lakes. At what is called the lakes, some twenty miles distant from the city, are to be seen some dozen professional hunters, who shoot away some hundred kegs of powder in a season, have a line of sail skiff boats, flat bottom, 20 to 25 feet long, cat-rigged, to the city. Some are very pretty models and fast sailers. It is an exceedingly hard and arduous task to navigate the intricate channel and find the city, especially in the night during fog and rainy and squally weather; they however make the trip and market their previous day's hunt, which has been as many as 250 mallard ducks. They command about \$1.50 pair; other ducks, when market is glutted, bring from 17 cents a pair to 75 cents. Snipe, curlew, plover are not much sold in our market, and the expense and trouble in killing them is too great for profit. At one small place in the lakes the mallard in the fall congregate by thousands, and are slain by hundreds with old time muzzle-loaders 10x42. Our professionals look upon breech-loaders as a Yankee invention of no earthly consideration. Every part would soon wear out in their hands, and the gun in a short time be utterly unfit for service; as regards the shooting qualities it is intensely inferior. The writer has recently heard more enlightened remarks, and he ventures to say ere another season rolls around a few will venture to lay down their hard-earned dollars for them. Ignorance is certainly a bliss where a professional goes against his own bread and butter in discarding breech-loaders. The professionals are probably the most obstinate set of men to deal with in existence. When once they take a notion that a certain brand of powder is bad, nothing can change them; remove the supposed bad powder into their favorite brand, and it is the best in the world, merely showing their intense ignorance upon the article and substance they every day use; and their opinion is utterly worthless the same way upon shot, being very vehement in their denunciations of certain brands. The lake is easy of access to the city in good weather, and is visited by a great many amateurs, who go there with full breech-loading apparatus, rigged in style, much to the professional disgust, to make game wild. They are usually rewarded by sundry messes of different kinds of fowl. On Bolivar is also a good ground for geese, teal and black duck, distant about seven miles, with innumerable ponds and sufficient protection to hide and creep on your game unawares. Many amateurs always shoot flying, take a stand and wait for the game to come along. The crack of the breech-loader is constantly heard, and those parties generally kill as much, and more, sometimes, than they conveniently can carry; and are regarded by the professionals with different respect from the others. Our friend, the light-house keeper, can, in a very short time, but a little way from his house, kill his 20 or 25 ducks; is heavy with an

Allen, and his distance—well, I hardly will say, but it beat any Northern sportsman's yards all hollow. In the Western Bay is the sportsman's paradise, a bay not much frequented; feather above and fin beneath, sport their idle and dreamy hours away in perfect security, a pleasant place for the sportsman in the dead of winter. Always warm, free from storms, yacht protected from the most violent gales, and game so plenty, no effort to kill. As the place is not known to any extent, and rather hard for sail boats to visit on account of intricate and shallow channels, and an out-of-the-way place generally, game of all descriptions seek it as their refuge in safety. The writer remembers one time while on a hunt after duck that he came near losing his life. There being two of us together, and walking through the grass a little way from our boat, we suddenly came upon a fine buck. There he stood, a noble animal. Both looking at each other, we fired, and having nothing in our barrels but small shot, as a matter of course, our noble buck hoisted the white flag and away he went. We had no more than brought our pieces to a position to reload, when we heard another cracking, and up came charging a bull—a wild one—perhaps never saw a mortal man before. Being in the old time of muzzle-loaders, we took to our heels and ran for dear life towards the boat. The old fellow took after the writer, and in the chase came near upsetting him; by giving some sudden wheels to the right and left we were enabled to baffle our pursuer and reached the boat in safety. His lordship, baffled, walked quietly away. My companion, in the meantime, having picked up gun, powder-flask, and ponch, was quietly coming up in another direction. We held a consultation, and concluded that discretion was the better part of valor, and hoisting sail proceeded higher up the peninsula, where we found quite an abundance of game. This happened a good many years ago, when we were boys. More anon.

J. L.

PROTECTION OF GAME.

BALTIMORE, June 13, 1874.

EDITOR FOREST AND STREAM:—

The deep interest you have taken, through the columns of your valuable paper, for the preservation of game, has awakened throughout the country a corresponding sentiment, which will bring forth great results. The key-note had to be sounded to bring the whole fraternity into accord, and loud and deep has been the response. The music sounds harmonious to the lover of rural sports, and its refrain will echo from every valley to mountain top throughout the land.

A society was organized in this city on the 8th of May last, called the "Maryland Association for the Protection of Game and Fish," consisting of the best men in Baltimore. The following are the officers: George S. Brown, president; Thomas Poultney, 1st vice president; Henry T. Weld, 2d vice-president; B. W. Jenkins, secretary; Robert Hodges, treasurer; John Stewart, counsellor; Committee at Large, P. P. Pendleton, R. C. Thomas, R. B. Bayard, T. C. Clark, C. D. Fisher, T. W. Levering, and an auxiliary committee named from each county in the State, all of which have pledged their "most sacred honor." This means business. They have met with much opposition, as was expected; for every encroachment on "vested rights," long indulged, is an innovation the thoughtless and unscrupulous angler will not submit to, at least without a growl. A few vigorous examples, and eternal vigilance will do the rest.

B.

LAWRENCE, Kansas, June 20, 1874.

EDITOR FOREST AND STREAM:—

Enclosed please find score of the "Winkles," of Lawrence, in two pigeon matches recently shot here.

June 16th.—Match at 21 birds each, 15 at 25 and 6 at 30 yards; 80 yards boundary; 1½ oz. shot.

Name	Gun	25 yds	30 yds	Name	Gun	25 yds	30 yds
Harris.....	Powell, c. f.....	8	2-10	Stuart.....	Gibbs, c. f.....	10	1 11
Carpenter.....	F. J. Abbey, c. f.....	8	2-10	L. E. Earle.....	Daly, c. f.....	12	2 14
F. S. Earle.....	Powell, c. f.....	6	5-11	Dr. Wheeler.....	Powell, c. f.....	11	0 11
Boswell.....	Powell, c. f.....	7	3-10	Thompson.....	Davis, c. f.....	12	1 13
J. D. Earle.....	Scott, c. f.....	10	3-13	Dr. Patterson.....	—, m.....	11	5 16
Total.....		54		Total.....		65	

Stuart's side won by 11 birds.

June 20th.—Sweepstakes, 25 yards rise, 80 yards boundary, first miss out, 1½ oz. shot.

Name	1st Sweep	2d Sweep	3d Sweep
Stuart—W. C. Scott & Son, c. f.....	4	1	3
Thompson—Davis, c. f.....	3	5	3
Harris—Powell, c. f.....	2	3	2
Carpenter—F. J. Abbey, c. f.....	1	3	2
F. S. Earle—Powell, c. f.....	1	5	1
Dr. Wheeler—Powell, c. f.....	1	0	1
Ben Akers—W. C. Scott & Son, c. f.....	0	2	2
Boswell—Powell, c. f.....	0	0	1
L. C. Earle—Daly, c. f.....	0	0	1

Stuart won first sweep, shooting Thompson out on fourth bird.

The second sweep was won by Thompson, who, after tying with F. S. Earle, shot off the ties in connection with the third event, and won on the seventh bird.

Owing to a lack of birds, the third sweep was not completed.

A. H. S.

PISTOL PRACTICE.

PEORIA, Ill., June 15, 1874.

EDITOR FOREST AND STREAM:—

Having been a careful reader of your paper for some time, I have read with more than usual interest that portion which relates to the use of the rifle. Having had some experience with that arm I would like to ask why it is that the "six-shooter" is neglected in the columns of your journal? Twenty men in every one hundred are supposed to be the possessors of a "shooter" of some sort, and nineteen out of that twenty could not, were they required to do so, hit the size of an ordinary man at a distance—say forty yards—with a six-shooter nine times in ten. Yet there are those who carry and shoot revolvers that would put to shame some of the crack rifle shots at short range, say 20 to 50 yards. The revolver, although worn in this country, is a neglected arm both in the army and out of it. Were more attention paid to this arm by our Government and less to cumbersome sabres, more execution could be done by our cavalry in the Indian country. There are in this country some of the best fire-arms of this character in the world, and at the same time some of the most worthless. It is no hard matter for an expert to take any of the three standard make of revolvers, i. e., Remington, Colt and Smith & Wesson, and fire at a target say ten inches in diameter all day long at a distance of thirty paces and never miss it once. Of course this could not be done with the smaller sizes, nor could all who possess or carry revolvers do this. But the art could be easily acquired by almost any one. Since the introduction of cartridge revolvers the market has been flooded with all manner of worthless shooters, which would, nine cases in ten, disgrace the scrap iron pile of either Colt, Remington, or Smith & Wesson; and we think that even sometimes our best makers do not put all the care on these weapons that they require.

Would it not be a good idea for some one to offer a premium (say a pair of first-class revolvers) for the best shooting—amateur, of course—with the six-shooter, at distances ranging from 10 yards up to 50? Which factory will set the ball rolling? They all claim to make No. 1 shooters. The revolver is being sadly neglected. We are not losing our reputation as a nation of marksman with the rifle, I trust, yet, though we never did make much pretensions with the revolver, I am afraid how to use it skillfully is becoming a matter of the past. Let us try and see what the revolvers of this country amount to. If they are worthless we want to know it.

AMATEUR SIX-SHOOTER.

MONTREAL, June, 1874.

EDITOR FOREST AND STREAM:—

A meeting of the Executive Committee of the Province of Quebec Rifle Association took place on the 18th of June, for the purpose of drawing up a prize list for the annual meeting and fixing the time of the same.

It was decided that the prize meeting should be held at Point St. Charles, Montreal, on the 11th of August and following days; that the sum of \$2,500 should be given in cash prizes, and that with a view of making our matches more attractive to strangers, the only matches confined to Quebecers should be the Snider championship match and battalion match, leaving some ten or eleven others open. We also decided that we would make nearly all the matches open to any military rifle, open sights, and 6 pounds pull of trigger, so as to admit the Remingtons, Springfields and other American arms. Our object is to further the cause of rifle shooting in general, and to give shooting men a chance of becoming acquainted with the different varieties of rifles in use. We hope that you will help us by using your influence with your Creedmoor men to induce them to pay us a visit. We will guarantee them the fairest possible play, and will treat them well. I send you some copies of our report for last year for distribution. The matches of this season will be almost the same as last, with exception of increasing the prizes 25 per cent, all round, and allowing any military rifles in place of Snider's alone. The idea of allowing the Springfields and Remingtons to compete was suggested by a conversation relative to making a match with an American team, and the proposal was carried unanimously. As soon as our programmes are issued, I shall send you a lot for distribution. Hoping to have the pleasure of seeing a good number of your riflemen here in August, I am, yours truly,

ROYAL.

THE TWO MATCHES AT CREEDMOOR ON SATURDAY LAST.—On Saturday, June 27th, the assemblage was a good one to witness the competition for the two prizes, offered by the Amateur Rifle Club and the *Turf, Field and Farm*. For the badge of the Amateur Rifle Club there were eighteen entries, with the following results:—

SUMMARY.

Third competition for the Amateur Long Range Badge, open to members of the Amateur Rifle Club. Distances, 800, 900 and 1,000 yards; position, any; weapon, any rifle not exceeding ten pounds in weight, with a trigger pull of at least three pounds; number of sighting shots, two; number of scoring shots, five. Day clear and bright, a little too much glare at times.

		900	0 4 0 3 3—10	
Colonel Gildersleeve.....	S. S.	800	2 0 4 0 3—9	19
		900	3 3 3 3 4—19	
Leon Backer.....	R. S.	800	0 0 0 0 2—2	18
		900	2 4 2 0 4—12	
P. G. Sanford.....	R. S.	800	0 2 0 2 0—4	16
		900	0 3 0 3 2—5	
C. W. Bang.....	R. S.	800	2 0 0 0 0—2	7
		900	4 2 0 0 0—6	
A. J. Hennion, Jr.....	S. S.	800	0 0 0 0 0—0	6

Captain Bodine won and received the badge with a score of 45, in a possible 60. His score of 18 at 800 yards was an excellent one, and he made more, as may be seen, on the 1,000 yard range than at 900. Mr. Roux's score of 19, in a possible 20, at 800 yards, is a very fine record, though he seems to have slipped up at the longer ranges. At half past three the *Turf, Field and Farm* Badge was shot for:—

SUMMARY.

Sixth competition for the *Turf, Field and Farm* Badge, open to members of the National Rifle Association; distance, 200 yards; position, standing; weapon, any rifle not over ten pounds in weight, with a trigger pull not exceeding three pounds; number of shots, five; about the same light as at the first match; Wind toward the conclusion of the match about III, and slightly puffy.

In marking there was some slight delay in the first match, but not of sufficient consequence to be more than commented upon. Errors of judgment will sometimes occur on the range from persons thinking that when they hear the thud of the ball it is on the target. The sleepers on which the targets stand are plated with iron, and it follows that a shot striking the plating is frequently thought to be on the targets. Of course, perfection in marking is very desirable, and, we think, may be attained in time. What is wanted are two more glasses and a telegraph. Both of these auxiliaries will be forthcoming in time. In summing up these two matches we think the efforts of the marksmen became somewhat exhausted in the long range match, as the off hand match suffers somewhat by comparison.

In future matches for the badge the Amateur Rifle Club have decided that hereafter the twelve highest shall fire at 1,000 yards, instead of only at 800.

On July 4th, at three P. M., there will be a match at 1,000 yards, any rifle, twenty shots, and two sighting shots; entrance fee, \$1; the best score to take what amount of money may remain after the markers have been paid for.

We are pleased to announce that the challenge thrown out by the Canadians for a simultaneous match, which appeared in our last issue, is in a fair way of being taken up by our marksmen. The arrangements are being made for a match say of seven rounds at 200, 500, and 600 yards. Time, probably about August 1st. We shall be very glad to facilitate this pleasant match in any way.

Quite a gallant match—to be called the Ladies' Day—is on the tapis, to be shot for at Creedmoor. One rule governing the match is that every gentleman is to bring one lady or more on the range. The prizes, in accordance with the presence and the circumstances, are to be ivory fans, parasols, gloves, etc., etc.

—On Monday the Seventy-ninth Regiment, about 200 strong, went to Creedmoor, under command of Colonel Shaw. Ranges were 200 and 500 yards. Ninety-three competitors failed to make the average eight points at 200. The best 12 shots made 351—by far the best shooting made by any team as yet. Mr. Edmundstone's practice at 500 yards, nineteen in a possible twenty, is very tall shooting. We give the shooting of those scoring up to twenty:

THE FOREST AND STREAM VASE.

THIS silver vase, designed and manufactured by the Gorham Manufacturing Company, was presented by us to the New York Association for the Preservation of Game and Fish. It was won by B. B. Harmon, Esq., of the Central City club of Syracuse. We congratulate this gentleman on his skill, and believe the FOREST AND STREAM vase could not have fallen into better hands.

—Ward of Toronto, Can., won the pigeon match at Ottawa, on Monday, against Paine of New York, by four birds on the single rise and two on the double rise.

—Persons leaving the city for the summer can have the FOREST AND STREAM mailed to their address for two months for one dollar.

MINK BREEDING.—Messrs Phillips & Woodcock, of Canada, New York, commenced two years ago the business of breeding mink for their fur. A correspondent of the *Buffalo Express* describes the "Minkery" in the following terms:—

"The 'Minkery,' designed to accommodate one hundred minks for breeding, consists first of an enclosure about forty feet square, made by digging a trench one foot deep, laying a plank at the bottom, and from the outer edge starting the wall, which consists of boards four feet high, with a board to cap the top, projecting upward eight or ten inches to prevent their climbing over. Within this enclosure is a building 14 by 24, supplied by running water, from which the mink catch living fish, that are often furnished, with the greatest delight.

"The building is constructed by an alley three feet wide around its circumference. Within are two rows of cells four feet deep and two and a half wide, each having a door ventilated at the top and bottom with wire screens, as is also the front entrance, what the proprietors call the ante-room, four by four feet, which must be fastened within every time the building is entered, to prevent the escape of the imprisoned animals. On entering the main hall, which the minks have access to (when not rearing their young), they present a very playful group.

"The person feeding them is often mounted, for their food and their tenacity of hold is so strong that they may be drawn about or lifted without releasing their hold upon the food. The nest of the female is very peculiarly constructed with grass, leaves, or straw, with a lining of her own fur so firmly compacted together as to be with difficulty torn in pieces. The aperture leading to the nest is a round opening, just sufficient to admit the dam, and is provided with a deflected curtain, which covers the entrance and effectually secures her against all invasion when she is within. About the middle of March the females are separated from the males until the young are reared. The necessity for this arises from the fact that the males seem inclined to brood the young almost as much as the dam, when both are permitted to remain together.

"The expense of feeding these animals is almost nominal, being supplied pretty much entirely from the usual offal of a farm yard, with occasional woodchucks and game in general. They eat this food with equal avidity after decomposition has taken place, devouring every particle of flesh, cartilage, and the bones. The flesh and bones entire of the woodchuck are consumed often at a single meal. While the expense of keeping is thus trivial, the profitable yield of the animal is comparatively immense, it being considered a moderate estimate or claim that the mink with her increase will equal the avails of a cow."

—At Pontiac, R. I., recently a pair of American river tortoises (*gymnopus spiniferus*) of great size, were observed coming down the Pawtucket River, with the current. When first seen they were engaged in fierce combat, which they kept up till the current carried them over the dam. The shock occasioned by the fall of their heavy, unyielding weight on the rocks below, appeared to put an end to the fight, and they were seen just under the dam, many times during the day. They were afterwards shot, and were found to weigh respectively forty-one and thirty-eight pounds, and measure nearly four feet in length.

Answers To Correspondents.

We shall endeavor in this department to impart and hope to receive such information as may be of service to amateur and professional sportsmen. We will cheerfully answer all reasonable questions that fall within the scope of this paper, designating localities for good hunting, fishing, and trapping, and giving advice and instructions as to outfits, implements, routes, distances, seasons, expenses, remedies, traits, sports, governing rules, etc. All branches of the sportsman's craft will receive attention. Anonymous Communications not Noticed.

R. & C.—1st. Consult Appleton's Railroad Guide for 1874. 2d. We cannot say. 3d. Ask for July flies at your fishing store. In June.

J. D. C.—Information such as you require would take up too much space to describe. You can find all about rifle shooting in Wingate's Manual, targets, method, &c., &c.

CULEXIFUGE.—A Potsdam angler says that camphor dissolved in sweet oil, adding $\frac{1}{2}$ part of glycerine oil to the mixture, is as good a protection against flies as the tar and oil and much more cleanly.

FRANK, N. Y.—There is no fishing nor any hotel at Sloatsburg. There is good fishing at Greenwood Lake, about eleven miles off, where excellent board can be had.

F. D. H., Cambridgeport.—I have been told that the Legislature of Nova Scotia has passed a law prohibiting the killing of moose for three years; is this so? Ans. Correct.

ALOSA.—I see you continue the shad in your list of fish in season for July. Did not the close season begin June 20? Ans. The Fish Commissioners have removed all restrictions against catching shad with fly at any season.

F. P., Montello, Wis.—Can you give me the address, No. and street of the *Field and Bell's Life*, published in England? Ans. The *Field* is printed by H. Cox, 316 Strand, London; *Bell's Life* William Clement, East Strand, London.

SUFFERER.—The following recipe is simply dead shot against either poison ivy or poison oak: Saturated solution of nitrate of potash, applied frequently to parts affected. Have a bottle prepared by any druggist to carry in your satchel.

J. H. W., Fort Wayne.—About mixing sweet oil and tar for fly and insect preventive, what proportions of each? Please give me name of some of your correspondents who propose a trip to Neepigon this summer? Ans. Three parts oil, one of tar. No memorandum of persons going to Neepigon, though several are booked.

F. M. Stone, Brooklyn.—The cheapest place for good fishing, boating, &c., at this season is Sag Harbor, Long Island. Take steamer W. W. Colt from foot of Wall street, Tuesdays, Thursdays and Saturdays at 5 P. M.; fare \$1.50; board \$7 a week at several places. Enquire at Tucker's fancy goods store, Sag Harbor.

W. E. T., Brooklyn.—I am about to start for the west central part of Minnesota, but while talking with a doctor about that section, he said in the months of July and August there was a fever, caused by the streams drying up. Will you ascertain if it is correct or not? Ans. Have passed several summers in Minnesota, but never heard of such a fever.

P. W. T.—Cost of the leading sporting papers in the States and Europe is as follows: New York—FOREST AND STREAM, \$5 a year; *Turf, Field and Farm*, \$5 a year; *Spirit of the Times*, \$5 a year—London, *Field*, 28s.; *Land and Water*, 28s.; *Bell's Life*, 28s.; *Sporting Gazette*, 15s.; Paris—*Chasse Illustrée*, 20f.

SUBSCRIBER, Brooklyn.—What is the best bait for catching fresh water eels with a hook, and what time of day will they bite most? Are we allowed to catch trout in August from the mill-ponds in Smithtown, L. I.? What is the best bait for perch? Ans. Eels bite best at sunrise and an hour after sunset. Fresh worms are the most killing bait. You can fish for trout in the preserves as late as September. Minnows.

A WEEKLY JOURNAL.

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCUCLATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company.

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,
[Post Office Box 2832.]
and 125 SOUTH THIRD STREET, PHILADELPHIA.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty per cent. for five copies and upwards. Any person sending us two subscriptions and Ten Dollars will receive a copy of Hallock's "Fishing Tourist," postage free.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, JULY 2, 1874.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Managing Editor.

WILLIAM C. HARRIS, Business Manager.

CALENDAR OF EVENTS FOR THE CURRENT WEEK.

FRIDAY, July 3d.—Huntingdon Driving Park, Huntingdon, Ind.—Utica Driving Park Association—Corinthian race for sloops—Columbus Driving Park Association, Ohio—Riverside Driving Park, Ottawa, Ill.—Galesburg Driving Park, Ill.—Blood Stock Association, Denver, Col.

SATURDAY, July 4th.—Utica Driving Park Association—Annual regatta Seawanhaka Yacht Club—Maine Boating Association, Portland, Me. Monmouth Park races—Regattas at Buffalo, Boston, Newburg, Salem, Lowell, and all over the United States—Driving Park Association, Huntingdon, N. Y.—St. George Cricket Club vs. Alpha at Salem—Columbus Driving Park, Ohio—Galesburg Driving Park, Ill.—Auburn Driving Park, N. Y.—Watkins Driving Park, N. Y.—Yale vs. Mutual at Brooklyn.

TUESDAY, July 7th.—Shooting Tournament at Detroit—Yale vs. Princeton at Brooklyn—Monmouth Park races.

WEDNESDAY, July 8th.—Tournament at Detroit—Dixon Park Association, Ill.—Boat race, George Brown vs. William Scharff, Springfield, Mass.

THURSDAY, July 9th.—Atlantic vs. Boston at Boston—Dixon Park Association, Ill.—Tournament at Detroit—Monmouth Park races.

TO THE PUBLIC.

EDWARD MOORE, who was formerly connected with the FOREST AND STREAM as canvassing agent, is no longer in the employ of this Company, his connection having ceased on the first day of May last.

PROTECTION OF GAME.

THE New York State Association for the Protection of Game took a long stride in advance at its late Convention, when it issued a call for a National Convention to be held next September, that is, if we assume that the object of the call is to secure better legislation and better protection for game, and a more rigid enforcement of the laws and vigorous prosecution of the offenders. No doubt this was the intent of those who moved and voted for a convention, though there is nothing in the resolutions to indicate it. As the resolutions stand the call has no significance or weight except as predicated upon the predilections of the delegates assembled, and the proceedings of the week. What these were may be inferred from the fact that some 9,000 wild pigeons were slaughtered on the grounds after the approved fashion of trap shooting. Pigeon shooting engrossed almost the entire attention of a large majority of the delegates. Only a few were interested in fly casting, or in rifle and pistol practice, while the bench show of dogs was nil. Upon these plain facts, we have a

right to assume that the call for the National Convention is to rectify the abuses of trap shooting, alleviate the sufferings of pigeons caged *in transitu*, and to diminish the slaughter which at a single week's sport requires a holocaust of 9,000 birds.

Now, it is most obvious to all persons interested in the preservation of game,—whatever the purport of this Oswego call may be,—that some immediate revision of the game laws is necessary, and that any new system must be based upon the intelligence which grows from a thorough study of the subject. Hence it has been deemed important that any convention called for such purpose should combine the wisdom of the naturalist, the breeder and the sportsman alike, the wisdom of men who have studied the characteristics of game in its haunts and in the field, of men who have bred and propagated the creatures, and of those who are enabled by scientific comprehension to determine varieties and species.

Thinking men have had this matter in mind and hand for many years, but it was not until last spring that thought and study took definite shape and were embodied in the scheme presented to the American Fish Culturists' Association and adopted by it at its convention on the 10th of February last. Pre-eminent among its endorsers stood Baird, the Chief of the United States Fishery Commission, who was warmly supported by naturalists from various sections of the United States and Canada. And so the scheme went out from that body for the world's approval. We have printed it several times in FOREST AND STREAM—first on February 19th, 1873, last in our issue of 25th of June just past. The Oswego Convention, when it issued its call for a National Convention, would have done wisely, and secured the confidence of all persons interested in the preservation of game and fish, had it received this scheme just as it came from the convention of February, and on the strength of its integrity issued its call. Then the public would have had some solid ground plan for work, something tangible out of which to form new and better creations, if such were desirable or practicable.

It was our intention to submit it to the Oswego Convention—indeed, we handed it to its officers for examination, and were assured that we should receive a hearing upon the floor of the convention; but when we presented our credentials as delegate from the "New York (city) Society for the Protection of Game," of which Royal Phelps, Esq., is President, and Hon. Robt. B. Roosevelt Vice President, we were excluded on technical grounds; and so the matter lapsed. As long ago as May 11th the society just named had endorsed the scheme and prepared a call for a National Convention through a circular letter, (for copy see FOREST AND STREAM June 25th) but deferring to the precedence due the State Association, held the call in abeyance until the Convention should meet in Oswego, that it might emanate from that body. The exclusion of its delegate prevented both the tender of the intended courtesy and the reception of the scheme.

Under these circumstances the (city) Society for the Protection of Game had no alternative than to send out its circular on its own responsibility to the various natural history societies, fish culturists' associations, and sportsmen's clubs, as provided in the resolutions adopted by its committee; and it has so done. The circular is merely a call for a National Convention upon the basis of the resolutions adopted at the meeting of Fish Culturists. Those interested in the matter will doubtless give it thoughtful attention, and determine for themselves in whose hands the matter can be left with the greater confidence and safety.

STEAM LAUNCHES AND THE STEAM-BOAT LAW.

EVERYONE conversant with boating must have observed the rapid increase of small pleasure boats driven by steam within the past two years. This is even more noticeable in England than in the States; but since their construction here has been so simplified and cheapened, and one company at least, as will be seen by our advertising columns, has made a specialty of building such boats, their evident adaptation to the purposes of the sportsman and pleasure seeker must speedily bring them into extensive use among us, unless in the zeal of our amateur law makers they shall be legislated out of existence.

When our very proper and wholesome "steamboat laws," designed to provide against the dangers of travel on the waters of the United States, were framed, such small boats were practically unknown, except as tenders to naval vessels, and therefore it is not surprising that provision was not made for them in that act. As it stands, therefore, if rigidly enforced, all such boats would be compelled to conform to all the rules and regulations laid down for the government of larger craft, or those under fifty tons. These rules require:—Regular inspection of hulls and machinery, regulation safety valves, pumps, feed water heaters, etc., with the possession, in a conspicuous position, of an official certificate of such inspection, an independent or "donkey" pump, fitted for fire hose, with five fire buckets and an axe, and the employment of a licensed pilot and engineer. We say "if rigidly enforced," because the requirements of the act being so obviously unadapted to small open boats or launches, and its enforcement, in most cases, an evident hardship, uncalled for by the circumstances of the case, most inspectors have conveniently refrained from taking official notice of such boats when used for purposes of pleasure. But though this method of meeting the necessities of the case would do sufficiently well when such boats were rare, for obvious reasons it is not the proper way to

overcome the difficulty. No law should be permitted to stand on the statute books which is not, for any reason, enforced; and when circumstances arise which require a modification of an otherwise good law, the sooner such changes are made the better. If the steamboat law be an unnecessary hardship in any case, or if its enforcement under any particular condition is not called for in the interests of the public welfare, then it should be amended at once, so as to except all such cases.

Now, wherein is its enforcement uncalled for in the case of steam pleasure boats? The government has an undoubted right to protect the lives of its people, and that the restrictions of the steamboat law were called for was only too painfully evident from the fearful "accidents" happening from the cupidity or criminal carelessness of the owners and managers of passenger steamers. But there is no more reason why the government should "inspect," "license," or otherwise control the private steam yacht than that it should inspect, license, or otherwise control the construction and management of a sailing yacht or a private carriage, or compel the employment of licensed cooks and coachmen. The inspection of hulls and machinery, however, cannot be called a hardship, unless it be in the fact that it is compulsory, for it is really in the interest of all parties—that of the public, who may be injured by the explosion of unsafe boilers, though they run that risk continually on land; that of the owner or purchaser, that he may not be cheated by unscrupulous builders, even though he be not thus protected in other matters; and that of the honest and respectable builder, to protect him against the competition of dishonest and reckless persons, who would risk the lives of their fellows to secure a temporary advantage. But the provisions for fire extinguishing apparatus, and for the employment of licensed engineers and pilots, is certainly uncalled for, unnecessary as pertaining to private boats, and not in accordance with the practice of government in other matters. Let so much of the law, therefore, as makes these provisions applicable to private boats be repealed, and they be placed on a par with all other establishments for private pleasure and individual enjoyment.

BETTING AT CONVENTIONS.—Some nine thousand birds having been killed at Oswego, we hope to see 20,000 shot at Niagara Falls next September, and that next year 50,000 more will be slaughtered somewhere else. With these special advantages, sure to draw the throng and be appreciated by the gun-maker and cartridge manufacturer, there is another element which such tournaments (not conventions) draw forth, and that is, that people are inclined to hazard a little money on the events. Mr. A, of such a club, is backed for a cool thousand in a quiet way, to kill more birds than Mr. C, of a rival association. We are pleased to see that Mr. Lamberton's movement to do away with all betting at meetings of sportsmen met with many supporters at Oswego. Would it not be well to remove the cause entirely at future conventions, and have neither fly casting nor pigeon or rifle shooting? A convention is one thing, a tournament is another. Half the mistakes in this world come from people not calling things by their right names. Some two weeks ago we received the following card from the Monroe Sporting Club, which we much regret want of space prevented our publishing at the time:—

ROCHESTER, June 5, 1874.

DEAR SIR:

At a regular meeting of the Monroe County Sportsmen's Club, held at their room last evening, the following resolutions were unanimously adopted:

Resolved, That any member of this club who shall hereafter be guilty of betting in any manner or way (on the ground where the shooting is taking place) at any of our club shoots, either on individual skill, or the result of matches, shall be summarily expelled from this club by the secretary erasing his name from the roll. A certificate properly signed with the names of two competent witnesses, who are members of this club, shall be the secretary's warrant for erasing the name of the offending member.

Resolved, That no betting on the result of shooting be allowed to any person on the grounds where the shooting is taking place, and that the officers of this club are directed to use the necessary means to prevent or suppress the same.

Resolved, That no ale, beer, or any intoxicating liquors shall be sold or dispensed on the grounds during any of our club shoots.

L. A. PRATT, Secretary.

What better comment can we pass on these measures, which we fully endorse, than by copying in full the excellent letter of our well known correspondent, which accompanied the resolutions passed by the Monroe County Sportsmen's Club?

ROCHESTER, N. Y., June 12, 1874.

EDITOR FOREST AND STREAM:—

On the enclosed card are series of resolutions of which the Monroe County Club have a right to be proud. This is a step in the right direction. It is to be hoped that other clubs throughout the State and county will follow this example. Our angling and shooting clubs should be noted as composed of sportsmen and not of sporting men. The members of our clubs who imagine that these exist as a means for professionals to make money, are laboring under a delusion; these were not originated for trap shooting solely, and much less for any species of gambling. A careful review of the history of these clubs, and of our State Conventions, will show that trap shooting grew up as an incidental affair. There were no trap shoots at the early conventions. A few gentlemen, lovers of out-door sports, met together to discuss the best means to protect game and song birds and fishes. Now, these objects are almost lost sight of in the yearly meetings of our State Association, while trap shooting and betting are the main attractions for many of the members of the various clubs throughout the State. Last year gamblers flocked from the cities to Batavia, where they assembled from day to day on the grounds of the association where the shoot took place, taking and taking bets as though they had been in a faro bank. Yours, very truly,

A. B. LAMBERTON.

—We fairly stagger under a load of honors. Down to posterity will go a collar called the FOREST AND STREAM collar, manufactured by the Metropolitan Collar Company. May we trust that in warm weather this collar may never grow limp.

PROFESSOR BAIRD'S VISIT TO THE FISH MONGER'S ASSOCIATION.—Among the many tasks, Professor Baird, chief Fish Commissioner of the United States, has imposed upon himself, is to determine the exact quantity of salt water fish received into the principal markets of the United States. Without positive data of this character, it would be impossible to determine whether certain kinds of fish were diminishing in certain localities on our coasts, or whether peculiar kinds of fish were replacing others. To get at the bottom of this and many other fish problems, the worthy chief commissioner, at a meeting of the Fish Monger's Association of New York, held on Thursday last, addressed the members begging that they would assist him in his labors, by giving him quarterly accounts of the fish which pass through their hands. Professor Baird, certainly the leading ichthyologist in the country, combines with his thorough knowledge the most practical ideas. Perhaps our fishermen may or may not be indifferent to the classification of fishes, but certainly Mr. Baird's straight forward talk must have interested them, for he told them, as they have been already informed by Mr. Brevoort in the columns of the FOREST AND STREAM, that anchovies could be found in abundance on our coast. He assured them that in season he would guarantee to deliver in New York, any day, one hundred barrels of anchovies, quite as good as the foreign fish; also that pompanos existed on our coast, but that the fishermen did not know how to catch them. Professor Baird explained to the meeting in his practical, straightforward manner the advantage of fish culture, and how in time, it was hoped, that shad and salmon would be found in our rivers in abundance. Many of the gentlemen present gave interesting data of the catch of fishes, and how they might be in quantity at one season, and not found at all the next. It was exactly in regard to these points, and the determination of the reasons of the scarcity or abundance of certain kinds of fish, that Professor Baird begged their co-operation in collecting for him the statistics of the fish trade. The President of the association promised to give his personal attention to the matter, and all the members agreed to render an account of the fish they disposed of. Professor Baird's plan is to have blanks printed, which will be distributed among the various large dealers in the city, which blanks they will fill up and forward to him from time to time. We feel certain that the gentlemen of the association will give Mr. Baird their aid. Our own experience in Fulton Market is, that no class of men can be found who, in conjunction with their business, take greater interest in the work of the Fish Commissioner, and we believe the assistance they will give will prove to be of the most valuable character.

NEW YORK STATE ASSOCIATION.

SIXTEENTH ANNUAL CONVENTION OF THE NEW YORK STATE ASSOCIATION FOR THE PRESERVATION OF FISH AND GAME AT OSWEGO—A LARGE ATTENDANCE AND AN EXCITED MEETING.

We are indebted to our correspondent, "Mohawk," for a full report of the proceedings of the New York State Association's Convention, held at Oswego last week, the same having been furnished conjointly to our valued contemporary, the *Turf, Field and Farm*, and ourselves. We condense largely the report of the first and second day's proceedings, already published in the *Turf*:—

June 22.—The delegates assembled in the Oswego Board of Trade Rooms, in the Doolittle House, at eight o'clock, and were called to order by the President of the Convention, Hon. A. C. Mattoon, who, in a few appropriate remarks, welcomed them on behalf of the citizens of Oswego.

The Recording Secretary, John B. Sage, of Buffalo, being unavoidably absent, on motion, Mr. H. L. Davis, of the Leatherstocking Club, was chosen Secretary.

The delegates from the following clubs then presented their credentials:

Andubon Club, Rochester.
Audubon Club, Buffalo.
Albion Rifle Sportsmen's Club, Albion.
Central City Club, Syracuse.
Dean Richmond Club, Batavia.
Forrester Club, Buffalo.
Genesee Sportsmen's Club, Irondequoit.
Jefferson Sportsmen's Club, Watertown.
Livingstone Sportsmen's Club, Genesee.
Leroy Sportsmen's Club, Leroy.
Leatherstocking Club, Oswego.
Lockport Shooting Club, Lockport.
Monroe County Sportsmen's Club, Rochester.
Madison County Sportsmen's Club, Morrisville.
Mohawk Game Club, West Troy.
Niagara Falls Shooting Club, Niagara.
Onondaga Sportsmen's Club, Syracuse.
Phoenix Club, Seneca Falls.
Queen City Shooting Club, Buffalo.
Wayne County Sportsmen's Club, Clyde.

The four following new clubs applied for admission and were admitted: Skaneateles Sportsmen's Club, Jordan's Sportsmen's Club, Mad River Sportsmen's Club, and Iliion Sportsmen's Club.

Besides these there were several county delegates whose clubs were not represented in the Convention.

Mr. Babcock, of the Monroe County Club, Rochester, called up his resolution, which, in conformity with the by-laws, he had sent to the Committee on Rules and Regulations three months previous to the meeting of the Convention, amending the by-laws to the effect "that no one shall contest for prizes offered by this association unless he be a member in good standing of some regularly organized club of this State or a county delegate, and he must have been a resident of the State of New York for six months previous to the last annual meeting of the association."

Mr. Poucher moved that the by-laws take effect next year.

Mr. Manning, of Syracuse, chairman of the Committee

on Rules and Regulations, stated that the committee had that matter in charge.

After much discussion, Mr. Flower, of Watertown, moved that the report of the committee, which was in favor of the resolution, be substituted for the resolution. Agreed to.

The Treasurer's report was read, which showed as follows: Receipts during last year, \$814.32; disbursements, \$291.46; balance on hand, \$522.86.

Mr. Murray, of Niagara Falls, invited the Association to hold their next meeting there.

Mr. Peck, of Lockport, offered a resolution that justice dictated giving it to any place competent to entertain the members who had never had it in preference to one that had had it. Considerable discussion followed.

Mr. Corbett, of Syracuse, moved as a substitute to Mr. Peck's resolution, that Syracuse be designated as the next place for holding the Annual Convention.

On motion of Mr. G. W. Flower, an informal ballot was taken, with the following result: Niagara Falls, 17; Watertown, 12; Syracuse, 26; Genesee, 17; Buffalo, 12; Lockport, 5; Oswego, 1.

F. B. Klock, of Syracuse, and C. L. Burgess, of Lockport, were appointed Captains of the State shoot on the following day, and the Convention adjourned to Tuesday evening at eight o'clock.

Second Day, June 23.—Tuesday was occupied with the State shoot, open to all members of clubs in the State belonging to the Association, and county delegates—10 birds each—the losing side to pay for the birds; and pistol and rifle shooting both at short and long range.

Sides having been chosen, the State shoot, or, as it really is, the practice shoot, the value of the birds being all that is shot for, the losing side paying for them, commenced. As will be seen from the figures I append, it was very close, Captain Burgess winning by only four birds.

THE LONG RANGE RIFLE SHOT.

The distance was 300 yards, and the first prize, which was won by Mr. Rogers, was a silver-plated ice pitcher. Mr. Nichols won the second prize, an opera glass. The following is the score: Wm. Ramsdell, Albion, 60 9-16 in.; E. B. Rogers, Albion, 32 in.; J. Binley, Albion, 57 in.; R. J. Rathbun, Auburn, 39 9-16 in.; C. Farer, Syracuse, 42 7-16 in.; John Nichols, Syracuse, 37½ in.; W. S. Barnum, Syracuse, 44 3-16 in.; L. Eggleston, Baldwinsville, 52½ in.; E. G. Chase, Genesee, 47 5-8 in.

THE SHORT RANGE RIFLE SHOT.

The distance was 100 yards, off-hand, open globe sights, and the first prize, which was a Remington breech-loading rifle, was won by O. G. Jones, Central City Club, Syracuse; the second prize, a Hunter's Pet Rifle, E. G. Chase, of Livingstone County Club, Genesee, won. The following is the score: J. Rafferty, 61½ in.; J. Carter, 48 in.; E. G. Chase, 44½ in.; S. V. Rhodes, 46½ in.; L. Barber, 49 in.; O. G. Jones, 40½ in.

PISTOL SHOOTING.

The distance was 15 yards, single barrel, off-hand, fired at word. Mr. John B. Higham, Buffalo, won first prize, a silver-mounted Smith & Wesson No. 3 revolver, with case. J. M. Witmer, Niagara Falls Club, won the second prize, two hunting shirts.

In the evening, at eight o'clock, the Convention assembled again, and after a lengthy and warm discussion finally came to a vote, and Watertown was elected by one majority over Niagara Falls.

OFFICERS ELECTED.

The Convention proceeded to ballot for officers as follows, and they were elected:

President, George W. Flower, Watertown; First Vice-President, L. J. Peck, Lockport; Second Vice President, N. W. Nutting, Oswego; Recording Secretary, J. B. Sage, Buffalo; Corresponding Secretary, Charles R. Skinner, Watertown; Treasurer, S. M. Spencer, Rochester. Standing Committee—Charles Burgess, Lockport; H. C. Tanner, Oswego; James Manning, Syracuse; W. H. Bowman, Rochester; W. J. Babcock, Rochester.

A NATIONAL CONVENTION.

Mr. Mattoon called Vice President Klock to the chair and advocated taking steps for a National Convention. He offered resolutions that this Convention indorse the call for a National Convention, issued in the *American Sportsman*, and that we name Niagara Falls as the place,

and on the 9th of September next as the time; that we elect five delegates, and that other States be invited to do the same.

Mr. G. W. Flower, of Watertown, and Dr. Rowe, of the Mohawk Game Club, warmly advocated the measure.

The resolutions were adopted.

Mr. Murray moved that Hon. A. C. Mattoon be the chairman of the delegation, and that he appoint the other four delegates. Carried.

The President named Mr. Murray, of Niagara Falls; Dr. Rowe, of Mohawk Game Club, West Troy; George W. Flower, of Watertown; Mr. W. J. Babcock, of Monroe County.

Mr. Flower moved that each delegate to the National Association have power to appoint five delegates to accompany him. Carried.

Adjourned to Wednesday evening at eight o'clock.

Third Day, June 24.—Fly-casting at half-past eight o'clock this morning commenced the sports of the day.

First prize, an elegant silver-mounted split bamboo fly rod.

Second prize, a silver-mounted fly rod.

Third prize, No. 1 Orvis fly rod, silver-mounted.

Fourth prize, Prof. McCord's double spool and reel line.

Fifth prize, Fowler's rubber reel.

The following is the cast:

Name.	Feet.	Inches.
R. Wood, Syracuse.....	68	6
S. M. Allen, Oswego.....	65	6
C. Northrup, Rome.....	63	6
J. F. Miller, Oswego.....	62	6
N. W. Wright.....	56	8

Fourth Day.—Single trap-shooting. Judges, Capt. Bogardus and C. D. Page, of Rochester; Referee, J. L. Paris. The first prize, a gold hunting case watch, presented by the Oswego lumbermen, was won by E. Hudson, of the Central Club of Syracuse. The second prize, a silver pitcher, presented by Jules Wendel of Oswego, was won by E. B. Hambleton, of the Forrester Club. The third prize was won by W. S. Murray of the Phoenix Club.

In the evening the fourth session of the convention was called to order, and the following committee was appointed on the revision of the Constitution and By-Laws:

W. H. Bowman, Rochester; C. W. Hutchinson, Utica; J. B. Sage, Buffalo; L. J. Peck, Lockport; S. Green, Rochester; S. M. Allen, A. F. Smith, Oswego; J. M. Witmer, Niagara Falls.

Also the Sub-Committee to attend the National Convention at Niagara Falls, September 9, 1874, as follows, each member of the general delegation having the right to name five delegates to accompany him:

By Dr. Rowe.—F. A. Carroll, F. B. Klock, Syracuse; Col. F. G. Skinner, Utica. (The other three to be named hereafter.)

By Mr. Murray.—Hon. William Pool, Cyrus E. Davis, William Samways, Niagara Falls; J. B. Sage, Buffalo; J. T. Fullerton, jr., Niagara Falls.

By Mr. Mattoon.—Delos Dewolf, F. T. Carrington, A. S. Page, C. T. Richardson, John G. Kellogg, Oswego.

By Mr. Babcock.—C. C. Morse, Seth Green, A. B. Lambertson, Rochester; Milton Hoag, Seneca Falls; Horatio Seymour, Utica. (Applause.)

Mr. Lambertson of Rochester offered a resolution that no betting of money be allowed on the grounds when the shooting by members of the association is taking place. After an interesting discussion, in which Messrs. Nutting, Poucher, Babcock and Murray took parts, advocating the measure, the resolution was passed, and the committee on the by-laws directed to report on the same. A complimentary resolution was then offered by Mr. Murray of Niagara Falls, as follows:

Resolved, That the thanks of the Association be returned to Hon. A. C. Mattoon for the very courteous, patient and efficient manner in which he has conducted its affairs as its presiding officer; and also to the Leatherstocking Club of Oswego for their hospitable reception, kindly care, the fine field and efficient police regulations provided by them for the association.

After a pleasant response on the part of Mr. Mattoon, the Convention adjourned *sine die*.

Want of space in this issue will prevent our giving in detail the various scores made in the single and double shooting on Thursday, Friday, and Saturday last. In our next number we shall publish such scores in full for the sake of reference. For double birds: E. B. Hambleton and George Smith of the Forrester Club of Buffalo, each with nineteen birds, divided the first prize, a very fine Remington Breech loader. Of the eighteen ties, R. Newell took the second prize, the *Turf, Field, and Farm* Cup. Of the ties of seventeen, F. Truman of the Iliion sportsman's club won the third prize. The ties of sixteen was won by W. S. Lansing, who took a Parker belt.

For single trap-shooting, E. Hudson of the Central City Club took the first prize, a Parker gun. In the ties of nine the second prize was awarded to R. B. Harmon, of the Central City Club, of Syracuse, who carried off the FOREST AND STREAM Vase. For the ties of eight, P. Tompkins, of the Dean Richmond Club, of Batavia, won the third prize, a pocket rifle. The fourth prize was given to W. S. Lansing of the Forrester Club of Buffalo. The Dean Richmond Cup was won by the Forrester Club of Buffalo with a score of 50.

—The following from the *Field*, shows that eggs of birds will stand long transit from India to England. It is probably not as much the length of the voyage as the extreme heat which may spoil the eggs. A correspondent of the *Field*, W. J. S., writes as follows:—

Two or three years after my return from India in 1861, a friend sent me a sitting of thirteen partridge Cochin hen eggs from Bombay, which were packed very tightly in a box in bran, with thick folds of paper inside the box, at top and bottom. These eggs I was informed were quite fresh, being laid the day previous and the one on which the steamer was despatched from Bombay. Three chickens only out of the thirteen eggs, were hatched (one cock and two hens, if I recollect right), all the other eggs being rotten; and these three grew remarkably large and fine fowls.

The loss of seventy-five per cent. of the eggs is not of course a good result. The result of this experiment is, however, useful to us, as it seems to show that the eggs of our own game birds might be sent to England without much risk. It is, however, one question to hatch out the birds in England, and another one to raise the progeny.

We await with some interest reports from the other side in regard to quite a number of the eggs of our pinnated grouse sent by Mr. Richard Valentine, of Janesville, Iowa, to England, and in due time will inform our readers of the results.

CHILDREN'S EXCURSIONS.—George F. Williams, Esq., to whose excellent administrative powers, much of the success attending the *Times* children's excursions were due, will resume this year the management of the Poor Children's Excursion Fund. Some \$550 are already in hand. Further subscriptions will be received by Wm. Butler Duncan, 11 Nassau street, Edward King, Union Trust Company, Charles H. Marshall, 38 Burling slip, Theodore Roosevelt, 94 Maiden lane, George H. Brodhead, 12 Wall street, Trustees, &c. While many of our readers are enjoying the sports of the forest and stream, drinking in pure mouthfuls of air, and acquiring renewed health, let them not forget the poor inmates of the slums.

YESTERDAY THE PHILADELPHIA ZOOLOGICAL SOCIETY opened their garden at Fairmount Park. We have before this noticed the progress made by this society. It is highly creditable that the work they have inaugurated is entirely due to private exertions. We believe with the nucleus they now have that in time they will have the most extensive collection in the United States.

Sea and River Fishing.

FISH IN SEASON IN JULY.

Salmon, <i>Salmo Salar</i> .	Salmon trout, <i>Salmo confinis</i> .
Trout, <i>Salmo fontinalis</i> .	Shad, <i>Alosa</i> .
Land-locked Salmon, <i>Salmo gloyeri</i> .	Michigan Grayling, <i>Thymallus tricolor</i> .
Black Bass, <i>micropterus salmoides</i> .	Micropterus nigricans.
Striped Bass, <i>Roccus lineatus</i> .	Sea trout, <i>Salmo immaculatus</i> .
Bluefish, <i>temnodon saltator</i> .	Weakfish.

—Salmon plenty in market at twenty-five cents. Bulk of salmon coming from the Provinces. We saw one at Middleton & Carman's weighing over forty pounds. Moon fish mentioned by us some time ago, as a fish almost unknown, is now becoming appreciated, our principle hotels buying them. Before long when their excellence is known, they will be among the most highly prized fish in market. Spanish mackerel plenty at twenty five cents. The first caught in our neighborhood was off Monmouth, N. J., and brought \$1 a pound. Bass still plenty, and very cheap, fifteen cents for big ones, three cents advance for smaller ones. The catch off Cape Cod is said to be very large. Blue fish abundant at six cents. Soft crabs scarce, and diminishing in quantity. King fish rather scarce at twenty cents. A big catch of pompinos, fully 350 pounds, came into market last week, sold at fifty cents.

—Bass-fishing is in order now at Squidnocket, West Island, Cuttyhunk, Pasque Island, Gay Head and all along the shores of Rhode Island and Massachusetts. When the bass begin to take bait there is some inducement to try them. In the early part of the season nothing will kill but the old bass bob, and the sport connected with fishing with it may be easily expressed by a —. The fish thus far taken have been unusually clean and handsome. The heaviest weight we have yet heard of is forty-seven pounds.

—Tautog are plentiful and run in fair weight.

—Cod-fishing on the eastern shores of Prince Edward Island has been more than usually successful this season.

—The oysters at Fair Haven, Conn., both those that were planted in the early spring—about 150,000 bushels from Virginia—and the native ones, are dying off very rapidly from some unknown cause, and there is a prospect of high prices next fall.

—Shad continue to be taken with fly at Holyoke Dam, in the Connecticut River, Mr. Chalmers having taken several there last week. White miller and brown fly the most attractive.

—A New Haven correspondent mentions having taken a shad with a hook baited with angle worm in the Housatonic River.

—Fishing on the Racquette River, Adirondacks, has not been as good as usual so far, on account of cold weather and high water.

—The very best trout pond in the Adirondacks is one in which the boundary lines of three counties intersect. If any one can find it, he is welcome to the secret, for the first time divulged.

—Trout fishing in the tributaries of the Housatonic has been very good this season, large quantities having been taken from the brooks in Stockbridge and Sheffield, Mass., and in the vicinity of Canaan and Salisbury, Ct. A week ago Mr. Pease, of Twin Lakes, took a large number of ten-inch trout from a branch of the Blackberry River to stock his pond with. Bass and pickerel fishing is now in its prime at Twin Lakes. This locality can be reached by New Haven and Housatonic Railroads, or by Harlem and Connecticut Western Railroad.

—Joe Jefferson (Rip) and son, and Mr. Pope of the St. Louis Theatre, were on the Beaverville last week, and exulted in the capture of several fine trout. There is the very best rabbit shooting in the mountains in this vicinity, and when the shooting season comes next fall, Joe is going to take "Schneider."

—F. Hosley, F. G. Kelsey, C. Nellis and Seymour Harvey, of Durhamville, spent one day at the Williams Hotel, Osceola, Lewis county, and before night caught one hundred pounds of trout.

—A party of gentlemen from Lyndon Center, Me., visited Portage Lake, Me., recently and brought home one hundred pounds of nice trout as the results of two day's fishing.

—For a useful handy little guide to the magnificent region of country which surrounds Moosehead, we would call the attention of tourists and sportsmen to the "Guide to Moosehead Lake," just published. The map will be found very accurate, giving a thorough picture of the innumerable lesser lakes which fill up the county. The book can be had for a dollar, either of Messrs. A. Clerk & Co., Maiden Lane, New York, or of John Krider in Philadelphia. We would advise any one going to that section of country, to take the Guide with them.

—Mr. W. W. Hill, of Albany, captured in the Adirondacks, last week, a trout that weighed four and a quarter pounds, and measured twenty-one inches in length. It was taken with red fly and six ounce cedar rod.

—Our Minnesota correspondent, "Haviland," writes from Brainerd, June 20th, thus:—

"I have had rare fishing this season in Gull Lake; this week four of us caught forty-two black bass in part of an afternoon, some of them weighing six pounds, with live bait, next day 130 pike perch (wall-eyed pike). Later, at Withington (Serpent Lake) 300 pounds in one day, (same party), black-bass, rock-bass, pickerel, "croppys" and perch. If any good fellows want some star fishing, have them write to me; I will be pleased to do anything for your friends or readers."

—At Janesville, Wisconsin, on Saturday, June 20th, Richard Valentine and brother took fifty-four black-bass, average weight two pounds, in little over three hours, using minnows for bait.

—Messrs. J. H. Wilder and H. G. Olds, of Fort Wayne, Indiana, start for the Nepigon River on 16th July. Quite a number of anglers are booked this month for the same locality.

—Salmon fishing is now excellent on the Lower St. Lawrence, although it was much retarded by the lateness of the season and high water in the rivers.

—The Massachusetts Anglers' Association of Boston is rapidly increasing its strength and its usefulness. Its efforts have already greatly curtailed illegal fishing in the Bay State.

—We are indebted to W. F. Whitcher, Esq., Canadian Fish Commissioner, for valuable printed documents relating to the Dominion fisheries.

—A very good pack basket for camping purposes can be seen at Pritchard Bros., 94 Fulton street, New York.

It is the regular Indian wicker basket covered with canvas and arranged with hasp and lock. The canvas cover of course adds to its strength, and renders it water-proof. The lock is adjusted in such a manner as to make it quite secure and perfectly safe to send by freight or express. The basket is intended to be packed at home and to go to the camp, as it is arranged with straps for a man's back, or so it can be carried as a pannier upon a horse. The great trouble of repacking at the end of the railroad and at the beginning of the tramp is thus dispensed with. It is very easy to get at along the route, and makes a capital and durable camp stool. As it is secured with a lock, the railroad companies do not object to checking it, as they frequently do camp equipage without a lock. Messrs. Pritchard Bros. will have these baskets for sale.

—A letter from Manitou, Colorado, dated June 20th, says that certain parties had just returned from the South Park with five hundred pounds of speckled trout.

RANGELY LAKES.—Our first letter from Camp Kinnebag, which appears herewith appended, was inadvertently left over from the week previous, much to our regret.—Ed.

CAMP KENNEBAGO, Me., June 13, 1874.

EDITOR FOREST AND STREAM:—

Our party arrived in good condition this evening, although the roads were pretty rough from Phillips to camp, and the "carry" in a very moist state, on account of the rain of the past few days. We find the Rangely and Kennebag Rivers very much swollen, the logs not having all departed, a boom of some two and one-half million feet being still retained above the dam on the Rangely stream. The weather has been quite cold and disagreeable, but to-day is very delightful and the thermometer indicates 69 in the shade. The Kennebag stream has furnished the best fishing so far, although "Indian Eddy," on the Rangely, holds its own as usual. The only large trout so far were taken by Mr. T. L. Page's party, ten days since, two weighing each 5 and 6 pounds. We encountered snow banks on the road from Phillips to Rangely Lake. The following gentlemen are at camp this week: Mr. R. G. Allerton, Secretary of the Goodyear Rubber Co.; C. L. DuBois, Washington, D. C.; Albon Man and E. D. Griswold, Brooklyn, N. Y.; S. V. C. Van Rensselaer and N. Perry, Jr., Newark, N. J.; E. M. Stillwell and Henry O. Stanley, Fish Commissioners of Maine; J. H. Kimball and Clarence Warden, Bath, Me.; Adon Smith, Jr. New York; R. C. Taft, Providence, R. I.; G. A. Robbins and Wm. Adams, Jr., New York; Lewis B. Reed, New Jersey; Thomas Sedgwick Steele, Hartford, Conn.; C. D. Wood, New York; George Dawson, editor *Albany Evening Journal*; Dudley Olcott, Albany, N. Y.; Abraham Lansing, State Treasurer of New York; Arthur Brown, Bath, Me., of the Androscoggin Railroad.

Messrs. Stanley and Stillwell placed in the Rangely stream this week some 20,000 young land-locked salmon, and it is thought they will add greatly to the sport in this vicinity. The black flies have just put in an appearance, but as they are an indicator of fine sport among the fish at this season, we rub in the tar oil and laugh at them.

June 20th.—The following bits of news are all I am able to communicate since my last favor from this region. With the exception of Monday, June 15th, it has rained all the week, thermometer ranging from 48 degrees to 58 degrees; quite cold, you see. Nevertheless, we have had very fair fishing. For the information of those members of the O. A. A. desiring to come here, I would say that the last of the logs were boomed out of Rangely River yesterday, June 19th, and the water is rapidly falling. A large number have been taken on a fly already, the following being the "cast" used: Silver doctor for stretcher, brown hackle for 1st, and red hackle for 2d, dropper flies.

Mr. R. G. Allerton, who has been here for two weeks past, has taken the following score over two pounds. Four trout which weighed each 2½ pounds; nine, 2½; two, 2½; three, 3. One each of 3½, 4, 5, 5½, 6, 6½ pounds. Mr. Geo. Dawson (Editor of the *Albany Evening Journal*) caught on a fly last night one which weighed 6 pounds, and an outsider landed one of 7 pounds this morning.

There has been very fine fishing at the "upper dam," and now that the logs are out it will greatly increase at this camp.

Some of the most elegant trout as regards color and marking have been landed this week, one of them, a three-pounder, having no less than *eighty-six distinct vermilion spots on one side* of it, to say nothing of a large number of orange spots, which increased its beauty. Some trout have also been caught with *red spots* on the dorsal fin, and also on the sides of the head, but these freaks of nature are very rare.

JOE.

MURKIRK, June 29, 1874.

EDITOR FOREST AND STREAM:—

Last Thursday, the 25th inst., a party of three went up to the Great Falls to try our luck at black bass fishing. We found the water alive with gar fish, about two feet long; they would steal the minnows about as fast as put on. The bass were very scarce, although a few striped and black bass were caught. Parties at the Falls say that the gar fish have driven the bass away. Either this, or else they have come in such numbers as to destroy the food of the bass and compel them to leave for other parts. I fished with a fly the first day, but could not get a rise. The gar fish would come up to the fly, but would not take it. While fishing I saw some gars attack a striped bass that was being played by another party; the gars followed the fish up and struck at it until it was captured. Are these gars considered good to eat? We had some cooked and found them very good eating, but were not satisfied with the color of the back bone. It had a greenish tinge, so that we hesitated about eating them. We were well taken care of by Messrs. Garrett and Maus, who keep a very good hotel.

Yours, &c.,

C. E. C.

We are indebted to an ardent friend of our journal for the following letter, dated at Utica, June 24th:

Sir:—In your answer to a correspondent a week ago, as to the best manner of reaching the Thousand Islands of the St. Lawrence, you mentioned the old route via Rome, Cape Vincent. Last fall the Utica, Black River and Odgensburg Railroad, completed its track directly to Clayton, and I enclose you time table. Their trains connect directly with Hudson River and New York Central Railroad here, passing through Trenton Falls, Boonville, Port Leydon, Lowville and Carthage, Boonville and Port Leydon being the better points for reaching the chain of lakes of Brown's tract, the last named point affording the better roads, while Louisville is but eighteen miles from Fenton's on Beaver River, which affords the sportsman a route through Smith and Albany Lake, either through Tupper's to Long Lake, or an eight mile portage to the Big Moose, to the fourth lake of the chain, or down the Moose River to Arnold's and the old Forge.

Yours truly,

C. W. H.

—Captain Taylor, of this journal, sends the following salmon fishing notes from Cape Breton, dated in camp, on the Northeast Fork of the Margaree River, Inverness county, June 22d:—

EDITOR FOREST AND STREAM:—

I arrived here safely, accompanied by my friend Mr. A. C. Lawrence, and attended by two servants (Gaffer and Cook), on June 20th. Started from New York June 14th, arrived in Boston at four P. M., thence on to St. John, N. B., which train now stops at Bangor, Maine, over night, (sad inconvenience). Arrived at St. John Tuesday, June 16th; bought supplies, and again took cars for Point du Chene. Wednesday, June 17th, raining, and blowing a gale; took steamer for Charlottetown, P. E. I. Good sea trout fishing on the river Dunk, twenty-five miles from Charlottetown. Gale blowing on the Northumberland Straits. Started for Pictou, N. S.; weather rainy; blowing like a Scotch mist, with a touch of hurricane behind it. June 18th, started for Hawkesbury, Cape Breton; thence drove eleven miles to West Bay; took steamer across the treacherous Bras D'Or; still blowing a gale, and arrived at Bedeque on Friday night, June 19th. On the morning of the 20th we again started to drive the thirty-five miles, and so arrived safely at the forks of the magnificently lovely valley and river of the Margaree; the water roily and high; very few salmon caught as yet this season. The nets at the mouth of the river are all blown away, and so the water is free for the fish to come up. The fly casting is easy. There are several English officers here at the different pools. We have half a mile of the river on both sides. P. S.—June 22d, six A. M.—Mr. Lawrence has just landed a rattling fine salmon of fifteen pounds, and hooked a larger fish on single gut.

J. N. T.

FISHING ON THE JERSEY COAST.

PHILADELPHIA, June 26, 1874.

Our mutual friend, Dr. Kenworthy, can supply reliable reports of such tremendous catches of Blue Fish at Barnegat, that I feel no disposition to attempt competition with him, although I have been led to flatter myself that I could hook and handle a blue fish as expertly as the generality of men. To be frank with you, I have in a great measure lost my desire to become the capturer of more fish than I can find mouths to consume, and hence am content to leave to the agile doctor the well-merited glory of being the most successful blue-fisherman on record, and what is more, a man who always manages to make a judicious and wise disposition of his big takes.

So far as the Jersey Coast is concerned, Barnegat is undoubtedly the most desirable point for blue-fishing, or for weakfish, king fish and bass. This fact is only beginning to be fully understood, thanks to FOREST AND STREAM and a few other papers. I have had fine sport there, and hope to have again before this season is over, but just for variety sake I visited Atlantic City this week, arriving there just in time to find that the big bluefish, which were very plentiful there, for ten days previous had taken their departure northward. As I learn by a note from Dr. Kenworthy, he intercepted them on Monday at Barnegat, capturing 154, weighing 900 lbs. A trial at Atlantic City resulted in a beggarly account of seven fair sized fish.

On Wednesday and Thursday we tried the black fish, bass, and weak fish, at the wreck of the Flying Dutchman, on Brigantine shoals. The first day the water was exceedingly rough, so that while we caught a great many fish, there was not the comfort that we desired. On Thursday, the ocean being nearly calm, we tried it again, having to use the oars to reach the wreck, our success was good. Abandoning the hand line entirely, we, to the amazement of our boatman used only the rod and reel. Many were the predictions in regard to the fate of our tackle, all of which were happily unverified. Our first catch was a porgy, of all things the most desirable, as it furnished us

with capital weak-fish bait. The water was perfectly clear, and for full ten feet down, we had a view of all that was transpiring. The first cast was followed by a strike, away went the fish for full thirty yards, followed by at least twenty others of equal size. It was a most exciting scene. Bringing the hooked fish up on a round turn, we brought him towards the boat, his mad companions dashing wildly around him, either eager to rescue him from his toils, or desirous of taking the remaining bait. Suspecting the latter, I played him awhile, when one of the followers seized the bait, and then I had two three pound fish to manage, with only a small rod and a light line. The boatman was wild with excitement; he had seen thousands of these fish captured with hand lines, but never with a rod and reel. Frantically appealing to me to land them, I at length complied, and much to his surprise and relief, they were soon floundering in the barrel.

The sport continued for some time, when a change of the tide stopped the biting and we returned to Atlantic City with the first catch of weakfish seen there for many a day. Some seven or eight other boats came on the ground after our arrival, but as they all fished with hand lines, they were rewarded with sea bass, porgies and black fish, but no squeteague.

Just here let me mention an interesting fact. Brigantine Shoals, as you are aware, are covered with the remains of vessels wrecked there in years gone by. Sailing over these wrecks, or drifting over them rather, we saw hundreds, yes thousands, of magnificent sheephead, black fish, sea bass and weakfish playing over and around them, as indifferent to the presence of the boat suspended over them, as though it were a passing cloud. We tried them with tempting bait, but in vain. They gracefully resisted all our allurements, rubbing their noses and tails against our lines and baits, but refusing to bite. It was tantalizing to be sure, but as there was no remedy for it, we had to content ourselves with feasting our eyes upon the splendid fellows swimming around so independently among the debris of the wrecked vessels.

A. M. S.

Yachting and Boating.

All communications from Secretaries and friends should be mailed no later than Monday in each week.

HIGH WATER, FOR THE WEEK.

Date.	Boston.	New York.	Charleston.
July 2.....	H. M. 1 41	H. M. 10 26	H. M. 9 41
July 3.....	2 28	11 11	10 28
July 4.....	3 14	11 59	11 14
July 5.....	4 2	eve 49	eve 2
July 6.....	4 55	1 42	0 55
July 7.....	5 51	2 37	1 51
July 8.....	6 51	3 38	2 51

THE LADIES' REGATTA OF THE NEW YACHT CLUB.—We were sorry to see so little enthusiasm manifested by the members of the New York Yacht Club, in regard to this new event, which we hope will become an institution in the Club. To us it seems to possess many advantages, in addition to giving the ladies a most enjoyable sail. Many yacht owners contend that they do not enter their vessels in races, from the fact of the trouble and expense entailed—hauling out, balloon sails, additional hands, and the damage to the internal fittings from the stowing anchors and all weighty articles below. That these are very valid reasons there can be no doubt, but why is it, when a race is offered them without any one of these objections, and a race which it seems to us is fully as great an honor to win as one of the other species, that so few boats are entered? Last Thursday's entries comprised only ten yachts of all classes, out of which nine started, viz:

FIRST CLASS CENTRE-BOARD SCHOONERS.

Name.	Owner.	Area, Cubic feet.
Tidal Wave.....	Mr. W. Voorhis.....	9 152 16
Idler.....	Mr. S. J. Colgate.....	7 944 84

SECOND CLASS CENTRE-BOARD SCHOONERS.

Magic.....	Mr. W. T. Garber.....	5 077 59
Cornelia.....	Dr. Vondy.....	2 659 94
Comet.....	Mr. W. T. Langley.....	Not measured.
Clio.....	Bradhurst & Asten.....	3 728 52

SLOOP.

Vision.....	Mr. J. J. Alexandre.....	2 544 75
Vindex.....	Mr. D. Center.....	3 258 91
Egeria.....	Mr. Sturges.....	1 420 32

The day was fine, and at the opening of the race a nice breeze was blowing from the south'ard and west'ard. The Committee and representatives of the press were on board of the Madeline, from which the starting signals were given. The course was the usual one, and the prizes the amount of the entrance fees in each class. At ten minutes past eleven the second gun from the Madeline announced the time to cross the line, and the yachts having a margin of ten minutes to get over, passed in the following order:

Name.	H. M. S.	Name.	H. M. S.
Cornelia.....	11 12 49	Idler.....	11 16 38
Egeria.....	11 14 54	Magic.....	11 17 58
Tidal Wave.....	11 14 54	Vision.....	11 18 50
Clio.....	11 15 50	Vindex.....	11 22 14
Comet.....	11 16 31		

The Tidal Wave soon took the lead, and began opening the gap between herself and the Idler, which in her turn had taken second place. There were few other changes in position until after the Southwest Spit had been rounded and the yachts headed for the Light Ship. Here the wind pegged out slightly, and the Comet going wonderfully well in the light wind passed the Idler and became second boat; she perceptibly hauled on the Madeleine too, who, in the mean time, had come down through the Sound channel to take the time of the yachts at the different turning points. As the Tidal Wave approached the Light Ship, the wind died out completely for a short time, when she got a puff from the eastward, which compelled her to flatten aft her sheets; however, after one stretch, she rounded the Light Ship and started for home, the other yachts meanwhile having lost their wind, waited for it, and naturally got it again from the old quarter. The Idler had meanwhile crawled to windward of the Comet; the Magic led the second squad, composed of the Vision, Clio, Cornelia and Egeria, the Vindex to the south'ard of them, and coming down fast. The time of rounding was as follows:

Name.	H. M. S.	Name.	H. M. S.
Tidal Wave.....	1 22 18	Clio.....	1 51 12
Idler.....	1 47 13	Vindex.....	1 53 05
Comet.....	1 47 38	Cornelia.....	1 53 53
Magic.....	1 50 04	Egeria.....	1 54 54
Vision.....	1 50 59		

From here on to the home stake boat the wind was light and there was little variety. The Tidal Wave sailed as she has done in every race this season, in the most splendid manner. The Comet also sailed marvelously well, and the Vision had her own day. There was too little wind for the Idler and Vindex to show any sailing. The race was finished as follows:

Yacht.	Arrival.	Actual time.
Tidal Wave.....	H. M. S. 4 33 16	H. M. S. 5 18 22
Comet.....	4 46 29	5 29 53
Vision.....	4 54 32	5 36 17
Magic.....	4 58 14	5 40 16
Idler.....	4 59 38	5 43 00
Clio.....	5 16 28	6 00 38
Vindex.....	5 24 06	6 01 52
Cornelia.....	5 45 00	6 32 12
Egeria.....	Not timed.	

The Tidal Wave therefore wins in the first class schooners, the Comet in the second class schooners, and the Vision in the sloops.

A RAPID RUN.—The schooner yacht Idler, Rear Commodore S. J. Colgate, of the Seawanhaka Yacht Club, on her trip to Newport, last week, sailing outside Long Island has, we believe, accomplished the quickest time between Sandy Hook, and Fort Adams, Newport, on record. Leaving the Battery at midnight, she worked down the Bay and through the Narrows against a strong flood tide, hauling up on her course to the eastward at 1h. 41m. A. M. There was a strong breeze from the north-west, veering more to the north on the following morning, giving her the wind just abaft the beam until she rounded Montauk Point, where of course it was necessary to trim aft. She carried during the greater part of the run double reefed mainsail, whole foresail, fore stay sail and jib.

Fort Adams was passed at 3h. 12m. P. M., making the time elapsed just thirteen hours and thirty-one minutes, and an average speed for the whole distance of ten and a half knots.

—The Corinthian Race for sloops, full particulars of which has already appeared in the columns of the FOREST AND STREAM, bids fair to be a most interesting event. Although the practice of Corinthian sailing was first introduced in this country by the Seawanhaka Yacht Club last summer, this race of to-morrow will be the first in which our large sloops have ever contended. We trust it won't be the last, and that Corinthian sailing may become as popular here as it now is in England. Nor is there any reason why it should not, unless we confess that as sailors we are inferior in pluck, skill and endurance, to our cousins across the water. The lists for entries will continue open until 2 o'clock this afternoon, (July 2d,) and the race will take place to-morrow over the course of the Seawanhaka Yacht Club, from Oyster Bay. The entries up to the present time are as follows: Addie, Mr. H. L. Roosevelt; Alert, H. Vail; Anna, Mr. Cummings; Vindex, Mr. R. Center; Vision, Messrs. Alexandre; Ida, Mr. Crocker; Kate, Mr. Lawrence; Qui Vive, Mr. Clapham; Helena, Mr. Flint; Kaiser Wilhelm, Mr. Greenleaf.

—The Oceanic Yacht Club of New Jersey, held its annual regatta on Monday, the several contests being open to the yachts of other clubs. There were nine yachts entered, and these were divided into three classes. The distances to be sailed were about twenty-five, twenty and fifteen miles, respectively. The first and second class yachts carried jib and mainsails, and the smaller yachts were all cat-rigged. The Brooklyn was awarded the Union prize in the first class. There was no club prize, as there were no club boats entered. The Emily P. won the Union prize in the second class, and the Tough won the Union prize in the third class, and the King the Club prize.

—A Union Regatta, under the auspices of the Perth Amboy (New Jersey) Yacht Club, will take place on the Fourth of July, open to all jib and mainsail boats not exceeding thirty feet at the water-line. There will be two classes. First class, 25 to 30 foot boats; prizes, \$100 and \$50. Second class, boats under 25 ft., prizes \$75 to \$30. Course twenty-one miles, around great Kills buoy and return. Time allowance, two minutes to the foot. Entrance money payable to Mr. Evan Thomas, Treasurer, 24 Broadway, N. Y., before noon, July 3d, or at the Raritan Bay Club House, Perth Amboy, N. J., before 9 P. M. same day. Entries must be made in writing, stating name and length of boat. Copies of the sailing regulations will be furnished boat captains on application, and a diagram of the course will be posted at the Raritan Bay Club House. By order of the Committee.

—Mr. Geo. Barclay Ward's yacht Aida, of which we gave a detailed description recently, has been shipped on the steamer Erin for London. Our readers will watch with considerable curiosity the result of her encounters with the English twenty tonners.

—The steam yacht Mermaid, Mr. J. Buchanan Henry, is now lying off Stapleton, Staten Island, having accomplished her first voyage, viz, from Philadelphia to New York, outside, in twenty-two hours.

—The schooner yacht Eva, Mr. E. Burd Grubb, has been on the ways at Red Hook for repairs to her centre board.

—The Wanderer, since her sale, has rapidly been fitting out at City Island, and we will soon have the pleasure of seeing that beautiful boat once more in commission.

SHIFTING BALLAST.—At a special meeting of the Dorchester Yacht Club, held June 19th, at the Club House, Commercial Point, the rule prohibiting shifting ballast was stricken out of the sailing regulations by a very close vote. This action is much regretted by many of the most influential and most thorough yachtsmen in the club, and it is feared that some of the best yachts will be withdrawn on this account. Already four yacht owners have intimated that their resignations would be sent in at an early date. Hitherto the Dorchester Yacht Club has enjoyed an uninterrupted flood of prosperity; its regattas and cruises have always had large numbers of yachts in attendance, but for the future the prospect is not so encouraging. However, it is to be hoped that seeing the error of their way, recreant ballast heavers will reconsider their rash movement, and that the Club will once again take its place in the foremost ranks of those that encourage the best interests of yachting.

It is worthy of note, that in the regatta of the 20th inst., the yacht owned by one of the most prominent advocates of sand bags, was beaten badly by a smaller boat that under the old regime was scarcely ever able to come to the front, and many of the yachtsmen are curious to know how such a result comes about, for of course if under the old

rule neither of the boats shifted ballast, they now sail on the same equality as before.

It would seem that in respect to the ballast question, we should be safe in following the example of the English Clubs; they have tried shifting ballast much longer than we, and finally given it up. When the English yachts, with their extreme narrowness and consequent want of initial stability, decide to abolish shifting ballast, it is obvious that we with our yachts of extreme beam and enormous natural stability, can not want shifting ballast on the score of safety. It is only the "jockey interest" in the Clubs, that desires to reduce the sport to the level of professional horse racing, boating or base ball, that advocates this pernicious method of sailing. This "jockey interest" is also opposed to owners sailing their own boats, and insists upon the privilege of hiring professional skippers, being determined to win the prize at any cost, (of money and hired brains,) caring nothing for the advancement of the true interests of yachting, or the encouragement of skill on the part of yacht owners.

CITY OF BOSTON SAILING REGATTA.—The following is a list of entries made up to Monday noon for the sailing regatta to take place July 4th in Boston harbor, off City Point, under the auspices of the city, the prizes for which were published in our last issue:—

FIRST RACE.

Boat.	Length on Water line.	Owner.	Rig.	Keel or Centreboard.	Where from.
Fearless.....	54 ft. 3 in.	E. P. Phillips.....	schr.	C. B.	Swampscott
Phantom.....	71 ft.	W. W. McField.....	schr.	keel.	Boston.
Edwin Booth.....		Thomas Cooper.....	schr.	keel.	Boston.
Florence.....		William C. Fowler.....	schr.	keel.	Boston.
Ettie.....		E. G. Martin.....	schr.	keel.	Boston.
Tartar.....	38 ft.	W. B. Hastings.....	sl'p.	C. B.	Boston.

SECOND RACE.

Clytie.....	33 ft. 6 in.	A. H. Meredith.....	sl'p.	C. B.	Boston.
Sea View.....	29 ft.	Charles Shepard.....	schr.	keel.	So. Boston.
Elsie.....	25 ft.	H. M. Martin.....	schr.	keel.	Boston.
John Bunyan.....	26 ft.	B. McLaughlin.....	sl'p.	C. B.	So. Boston.
Lillie.....	28 ft.	J. R. White.....	sl'p.	C. B.	So. Boston.
Gypsey.....	25 ft.	W. H. Howe.....	sl'p.	C. B.	So. Boston.
White Cap.....	34 ft. 16 in.	J. Malcolm Forbes.....	sl'p.	C. B.	Quincy P't.
Albina.....	33 ft.	W. A. Devine.....	sl'p.	keel.	Boston.
Naiad Queen.....	26 ft. 1 in.	E. Kilner.....	sl'p.	C. B.	So. Boston.
Osceola.....	30 ft.	H. Schellenger.....	schr.	keel.	So. Boston.
Geal.....	26 ft. 6 in.	W. McCormick.....	sl'p.	keel.	E. Boston.
Eva.....	25 ft. 4 in.	A. W. Bangs.....	sl'p.	C. B.	Boston.
Starlight.....	25 ft. 6 in.	Fred Wright.....	sl'p.	keel.	So. Boston.
Spitfire.....	25 ft. 6 in.	J. Winnett.....	sl'p.	keel.	So. Boston.
Mary Ellen.....	36 ft. 6 in.	W. S. Lord.....	sl'p.	keel.	Salem.
Vanitas.....	26 ft. 9 in.	Francis Clarke.....	schr.	keel.	Boston.
Sparkle.....	26 ft. 6 in.	A. A. Lawrence.....	cat.	C. B.	Chatham
Patience.....	30 ft.	Geo. W. Lawlor.....	schr.	keel.	Boston.

THIRD RACE.

Uncle Moses.....	21 ft.	C. H. & T. E. Dolbear.....	sl'p.	keel.	Boston.
Agnes.....	22 ft. 3 in.	E. P. Adams.....	sl'p.	keel.	So. Boston.
Gertrude.....	21 ft.	Joel Tuttle.....	cat.	keel.	So. Boston.
Racer.....	19 ft.	J. G. Lanning.....	sl'p.	keel.	So. Boston.
May.....	18 ft. 6 in.	C. F. Gorman.....	N't	C. B.	So. Boston.
Niagara.....	22 ft. 6 in.	Arthur L. Dean.....	N't	C. B.	So. Boston.
Fannie.....	21 ft. 3 in.	Walter L. Dean.....	sl'p.	C. B.	So. Boston.
Clyde.....	23 ft.	Lutted & Hatch.....	sl'p.	keel.	So. Boston.
Cyela.....	23 ft. 6 in.	H. R. Smith.....	sl'p.	C. B.	So. Boston.
Ruby.....	19 ft.	Q. W. Preston.....	cat.	keel.	So. Boston.
Mabel.....	13 ft. 2 in.	J. N. Roberts.....	cat.	C. B.	So. Boston.
Fearless.....	20 ft.	J. A. Woodward.....	cat.	keel.	So. Boston.
Ripple.....	22 ft. 2 in.	C. D. Macomber.....	cat.	C. B.	So. Boston.
Gamecock.....	25 ft.	J. Boyle.....	schr.	keel.	So. Boston.
Olive.....	24 ft. 6 in.	J. Roach.....	sl'p.	C. B.	So. Boston.
Stella.....	20 ft.	D. E. Bryant.....	sl'p.	keel.	So. Boston.
Queen Mab.....	21 ft.	M. J. Kiley.....	cat.	C. B.	So. Boston.
Louise.....	22 ft. 4 in.	J. W. Donovan.....	sl'p.	keel.	So. Boston.
Bull Bow.....	19 ft. 4 in.	Andrew Jackson.....	schr.	keel.	Chatham
Sunbeam.....	24 ft. 1 in.	W. S. Nickerson.....	sl'p.	keel.	So. Boston.
Unique.....	19 ft. 10 in.	J. M. Stuart.....	cat.	C. B.	So. Boston.
Kate.....	20 ft.	Thos. Scott.....	sl'p.	keel.	So. Boston.
White Wing.....	21 ft. 6 in.	Bartlett & White.....	sl'p.	keel.	So. Boston.
Bessie.....	18 ft.	F. A. Taylor.....	sl'p.	keel.	So. Boston.
Unknown.....	22 ft.	C. H. Bigham.....	cat.	keel.	E. Boston.
Truant.....	17 ft. 6 in.	Geo. L. Hall.....	cat.	keel.	So. Boston.

Very few entries have yet been made for the rowing regatta. It is not usual for them to enter until within a day or two of the race.

—A spirited four oared race between the Argonautas and Buffalos was rowed on the Kill von Kull, on Friday afternoon, resulting in a victory for the Argonautas by about two lengths. The race was for three miles, from off the wharf at New Brighton to a stake-boat off the light-house on Shooter's Island. The crew of the Argonautas consisted of Edward Smith, bow; Walter Man, 2d; Benj. Stephenson, 3d; Fred C. Eldren, stroke. The crew of the Buffalos consisted of Charles W. Baldy, bow; John N. Dorr, 2d; John B. Green, 3d; Charles E. Dunbar, stroke. A severe rain squall prevailed during the race, which somewhat interfered with the time made, which was 16 minutes 46 seconds, the Buffalos being 8 seconds behind.

—We were pleased to receive a visit at our office from Charles F. Vose, Esq., President of the Halifax Rowing Club. Mr. Vose came to New York for the purpose of selecting a referee for the approaching race between Brown and Scharff. This race, an International one, will take place on the Connecticut River, at Springfield, Mass., on July 8. Brown is already in training in the vicinity. Since the contest between Hamill and Brown, it will be the most important race of the last few years.

—On June the 27th, a single scull race, which turned out to be one of the closest and most interesting of the season, took place on the Charles River, between Plaisted and Ahern. Distance two miles. Won by Plaisted, who was two seconds ahead of Ahern. Time of the two miles, 15:36.

—The great three mile race for single sculls, \$500 a side, between William Scharff, of Pittsburgh, and James Ten Eyck, of Peekskill, rowed last Thursday, resulted in a victory for Ten Eyck. The betting on the previous day had been two to one on Scharff, and the result must have astonished many people. There was quite a breeze blowing and the water was rather rough, or the race might have terminated differently. Ten Eyck took the lead at the start and kept it for about a quarter of a mile, both men pulling about thirty-four strokes a minute. Scharff now spurred, and the Pittsburgh boat shot ahead and kept the lead all the way to the stake boat, which she turned ten seconds before her opponent. On the return, it became evident that Scharff's boat had shipped considerable water, and although he pulled pluckily on the last quarter of a mile, Ten Eyck, in a magnificent spurt passed him, and at the finish was in advance about four lengths. The following is the summary:

Peekskill, June 25, 1874.—Single scull race, one and a half miles and return, for \$500 a side. Judges, James O'Neil and William Coates. Referee, Benjamin F. Brady.

James Ten Eyck, of Peekskill, one; William Scharff, of Pittsburg, two. Time—24m. 30s.

PHILADELPHIA, June 29, 1874.

EDITOR FOREST AND STREAM:—

After the excitement of the regatta of the 17th and 18th, things along our river front seem very dull. However, last week, found the river well dotted with single scullers, getting ready for the local regatta, which was set down for next Saturday, July 4th.

Three or four four-oared shells make their regular trips, and one of them, the Quaker City, was doing some right pretty work.

On Saturday however, the Naval Board held a special meeting, and at that late date saw the error of their ways, and altered the date at which we may contend for the Navy flags to September 26th.

Now the boys can row to the Falls for their customary Fourth of July breakfasts, and have their races at a time when the thermometer is not so likely to be in the 90's.

Truly yours, SCULLS.

CORNELL UNIVERSITY, Ithaca, N. Y., June 2.

EDITOR FOREST AND STREAM:—

Our Saratoga crew have been hard at work at their quarters for about four weeks now, and to all appearances they will be ready to put in a strong—at least a heavy—claim for recognition on the 16th of July next. The crew is formed of the following men: Ring, Corwin, Garvin, Clark, Southard and Ostrom, with Henderson and Myres for subs. They are all, with one exception, large, strong, and hardy men, and will undoubtedly do enough extra work to more than offset their extra weight. Your information in regard to our stroke being changed was not correct. Mr. King acts in that capacity at present, as he did last year, and as he undoubtedly will in the race. The crew will leave for Saratoga next week, if possible; if not, then immediately after commencement, which takes place July 2d.

Rational Pastimes.

Secretaries and friends of Athletic, Base-Ball, Cricket and other outdoor Clubs will kindly mail their contributions not later than Monday in each week.

—The St. George's Club, of St. Louis, and the St. Louis Club, played their second eleven on June 20th, on which occasion the St. Louis party won by 138 to 100. St. Louis went in first and scored 75, of which T. Hopwood contributed 22—not out—and T. Warren 11, Lindley taking the majority of wickets. St. George then went in and ran up 60, of which Houston's 11 was the only double figure score contributed, Caddick the most wickets. In the second innings of the St. Louis eleven, Grayson made 21, and Whittaker and Warren a dozen each, the total being 63, Lindley again leading in bowling. The St. George then went in to get 79 to win, but they were disposed of for 40 only, Houston leading with 12, and Simpson making 11, Grayson bowling the most wickets. This is the second defeat for the St. George team.

—The St. George and Manhattan Clubs played their first match together on June 27th, at Hoboken, the result being the equal success of the St. George ten over the Manhattan eleven, by the appended score:

ST. GEORGE.										
Bance, c and b, Errington.....	29									
Cashman, c Ronaldson, b Errington.....	5

—In the second game between the Garden Citys of Tallahassee, and the Jeffersons, of Monticello, for the championship of the State, the Garden Citys were victorious, beating the Jeffersons by a score of 19 to 17.

—The College Club tourney at Saratoga, will commence July 13th.

—The match between the Germantown and Philadelphia clubs which was commenced June 20th, ended on June 27th in the following result:

Philadelphia, 1st.....	83
Philadelphia, 2d.....	164
Germantown, 1st.....	87
Germantown, 2d.....	81
	—168

Philadelphia's plurality..... 79

—The second innings of the Germantown eleven, played on the 27th, yielded 81 runs, of which James Hargreave's contributed 22, James Large 14, and John Hargreave's 12.

—Cricketers desirous of joining the tourists from Philadelphia, who are to go to Halifax to take part in the August tourney there, should send word to A. A. Outerbridge, 707 Walnut street, Philadelphia.

The professional games played since our last issue were as follows:—

June 22—Chicago vs. Hartford at Hartford.....	14 to 10
June 22—Philadelphia vs. Baltimore at Baltimore.....	13 to 7
June 22—Athletic vs. Atlantic at Brooklyn.....	5 to 4
June 23—Atlantic vs. Mutual at Brooklyn.....	14 to 7
June 24—Athletic vs. Mutual at Philadelphia.....	15 to 6
June 24—Boston vs. Chicago at Boston.....	10 to 2
June 25—Boston vs. Hartford at Hartford.....	14 to 13
June 25—Philadelphia vs. Mutual at Philadelphia.....	13 to 12
June 26—Boston vs. Chicago at Boston.....	8 to 7
June 27—Boston vs. Chicago at Boston.....	29 to 6
June 27—Mutual vs. Hartford at Brooklyn.....	7 to 3
June 27—Athletic vs. Philadelphia at Philadelphia.....	16 to 15
June 29—Chicago vs. Atlantic at Brooklyn.....	5 to 3

The record of championship contests to June 30, is as follows:—

Name	Games won.	Lost.	Played.
Boston.....	26	6	32
Athletic.....	13	9	27
Mutual.....	14	12	26
Philadelphia.....	11	9	20
Chicago.....	8	12	20
Hartford.....	6	14	20
Atlantic.....	5	12	17
Baltimore.....	5	19	24
Total.....	93	93	186

Thus far 93 games out of the 280 to be played before October 31 have taken place, and the first third of the season is over.

—The three Clubs which take the lead in games won by scores of nine runs and less, are the following:

	Played.	Won.
Mutual.....	12	10
Boston.....	13	9
Philadelphia.....	8	5

These lead in the best fielding games, the Hartford being last.

—The model games of the season in the professional arena thus far, are as follows: We limit the score of a model game to six runs for the winning nine.

Philadelphia vs. Mutual at Philadelphia.....	2 to 0
Mutual vs. Atlantic at Brooklyn.....	2 to 0
Boston vs. Baltimore at Baltimore.....	3 to 2
Chicago vs. Athletic at Chicago.....	4 to 0
Boston vs. Philadelphia at Boston.....	4 to 3
Athletic vs. Atlantic at Brooklyn.....	5 to 2
Mutual vs. Boston at Brooklyn.....	5 to 2
Mutual vs. Hartford at Brooklyn.....	5 to 2
Athletic vs. Atlantic at Brooklyn.....	5 to 4
Boston vs. Atlantic at Brooklyn.....	6 to 2
Atlantic vs. Boston at Boston.....	6 to 2
Philadelphia vs. Hartford at Philadelphia.....	6 to 4

—On the occasion of the Second Annual dinner of the employees of Messrs. Wynkoop & Hallenbeck's establishment, two nines were formed, respectively, "Monitor" and "Wild Oats." The "Wild Oats" were sent to the bat, followed by the "Monitors." After playing five innings, the score stood 22 for "Wild Oats" to 16 for the "Monitors."

THE LIVE OAKS AT LYNN.—The strongest amateur men in New England, played a match with the Chicago professionals last Monday, the latter winning by 12 to 4 only.

—The Maple Leaf Club, at Guelph, Canada, and the Easton nine, are to be among the contestants for the \$500 prize at the Watertown, N. Y., amateur tourney next month.

—In the grand match, North vs. South, on June 4th, in England, the North won by three runs only; G. F. Grace's 57 and Lockwood's 58, were the best scores on the North side, and Tupp's 52 on the part of the South, W. G. Grace scoring 29 and 37 for the South. The score was North, 251; South, 248.

—On Saturday last, Hugh Donahue completed at Springfield, Mass, the astounding task of walking 1,000 miles in 1,000 hours, a feat only accomplished once before, and that was by Captain Barclay. The time seems to have been accurately kept, commencing May 16th at 3.40, and ending on June 27th, at ten o'clock A. M. A medical man in attendance vouches for the facts and assures us that during the time of the walk Donahue never used alcoholic stimulants, nor had any medicine administered to him. Seven persons, swear that at least two of them were always present during the arduous walk. Donahue is a mill spinner, and in this business thirty miles walking to and fro with the machines is an every day task. We have so far every reason to believe that the performance was a bona fide one.

—The Yale College nine defeated the Princetons by 16 to 1 on June 29th, at Hartford. The latter were short their pitcher and second baseman.

—Beach of the Princetons and Sanford of the Yales are to play in the Staten Island nine against the Concorda on July 4th.

—The amateur rules will be published next Spring.

—Over a hundred base ball matches are arranged for the 4th of July by our metropolitan clubs. The grand game of the day will be Atlantics vs. Mutuals on the Union grounds.

NEW HAVEN, June 27, 1874.

EDITOR FOREST AND STREAM:—

The Base Ball tournament between the Freshmen nines of Harvard and Yale, June 22d, Harvard, 10; Yale, 4. June 28th, Yale, 28; Harvard, 14. June 29th, Harvard 16; Yale, 7. Although the series was won by Harvard, the result cannot be otherwise than encouraging to the Yale University nines, when it is taken into consideration that three of Harvard freshmen nine also belong to the University nine of that college, while Yale has none thus

situated. If under these circumstances the Harvard Freshmen nine can only with difficulty defeat the Yale Freshmen nine, Yale must appear to stand the best chance in the coming contests in Saratoga. It will be seen that Harvard made 40 runs in all, while Yale made 39. This afternoon, (Saturday), the Club plays a match with an amateur Club in Hartford, instead of with the professionals of that city, as announced last week, and on Monday, instead of Thursday they play the Princeton nine in that city.

TYRO.

—Among the novelties to be indulged in by our friends at the "Hub" on Independence Day is a timber race at South Boston. The contestants are to use forty-five feet pine logs, planks and squared logs; distance for men a mile and a half; for boys, half a mile.

New Publications.

Publications sent to this office, treating upon subjects that come within the scope of the paper, will receive special attention. The receipt of all books delivered at our Editorial Rooms will be promptly acknowledged in the next issue. Publishers will confer a favor by promptly advising us of any omission in this respect. Prices of books inserted when desired.

BOOKS RECEIVED.

1840 TO 1870. Agricultural Products of the United States and Territories. By Samuel B. Ruggles, of the New York Chamber of Commerce. New York: D. Appleton & Co.

This work at the present time affords much valuable information upon many subjects known but little, if indeed, many of the facts here stated were known at all. Mr. Ruggles' book comes to us as a reminder that this continent, by the force of its great agricultural expansive power and the native energy of its productive element, is destined to feed and clothe not only its own rapidly increasing millions of human beings, but millions of people who now dwell in the old world, or upon the islands of the sea. We would gladly quote from this epitome of the agricultural population of America, and notice many very grave as well as interesting facts in relation to the productiveness of this country; such facts as this: "That ten States, in 1870, produced more than 21,000,000 tons avoirdupois of cereals alone, and at the end of the century these products are estimated at 40,000,000 tons annually." This is by no means a dry book, but one rich in the kind of knowledge that coins gold. The price of this little work is only 50 cents.

FIELD ORNITHOLOGY. Comprising a Manual of Instruction for Procuring, Preparing and Preserving Birds, and a Check List of North American Birds. By Dr. Elliott Coues. Salem Naturalist's Agency, 1874. \$2.50.

We have in this book a companion indispensable to every one who has read carefully Dr. Coues upon North American Birds, and who has seen and examined his "Key" to the same. Every reader will be impressed with the great value of this work to every student of ornithology. Want of space in Dr. Coues' other works induced him to devote a special volume to the topics embraced in "Field Ornithology." Young ornithologists will be specially repaid in the careful perusal of the first portion of the book, which treats upon the collection, preservation and preparation of birds. Chapter 3 is of great value to those who use the dog as an aid to their success in the collection of many kinds of birds, whose habits render them difficult to take. The "Hygiene of Collecting" is very valuable, as the writer can personally testify, for we have often lost fine specimens of birds from a lack of the very knowledge so pleasantly and plainly imparted by Dr. Coues. We have lost birds, both live and dead, for the simple reason we did not know how to manage them. We have learned much from the careful study of Dr. Coues' books, and desire to impress their great value on all who love the sports of the chase, or the study of ornithology.

THE THREE JUDGES OF CHARLES I. By Israel P. Warren. New York: Wyman & Warren.

This is a very well written work upon the existence of the regicides for some considerable time in the State of Massachusetts. There are persons even at the present day that would, if they could, deny the very existence of Washington; who see nothing venerable and truthful in many old historical facts that are as true as the existence of the world. Such men are of no benefit to society, do but little good, and believe but little of anything. We like men who candidly and for truth's sake examine all the old traditions and without captiousness seek after and give utterance to great truths, especially the facts of history and biography. The work before us is a biography that belongs to the times of the early Puritans, and the existence and residence of these men have always been received as one of the great facts that make the names of the famous regicides, Whalley, Goffe and Dixwell, like our most cherished household memories.

LAKE SUPERIOR GUIDE. With Township Map, including Lake Superior Region and Northern Minnesota. Philadelphia: J. Disturnell, 1874.

In a convenient form this Guide book embodies the geography and topography of the Lake Superior Region. Routes and distances are given, and all objects of interest indicated to the traveler. The Neepigon River and the explorations in that region are embodied within the "Lake Superior Guide," and the book will be found useful to travelers who may take a trip to our great inland seas.

GUIDE TO MOOSEHEAD LAKE AND NORTHERN MAINE. With Map. T. W. Ripley. Boston: 1874.

This is an exceedingly compact little book, having no end of useful information in it, not only as to the lay of the land, the routes, the railroads, steamboats and stopping-places down East, but contains a great deal that is instructive about the animals, the canoes, guides, outfits, and the general expenses of the tourist in Maine. The map of Moosehead Lake, with the countless other lakes that cluster round it is quite a good one, and will be found immensely serviceable to those who fish or hunt in this most magnificent region.

GEOLOGICAL SURVEY OF NEWFOUNDLAND. Alexander Murray F. G. S. Director. Report of Progress for the year 1873.

—In compliance with repeated demands that we shall "exalt our horn," we print this exceptional "hoister."

KNOBNOTER, Mo., June 12, 1874.

EDITOR FOREST AND STREAM:—

Although a stranger to you, I must take the liberty of writing to tell you how thoroughly we in the western country appreciate your eminently successful efforts in starting a paper which is just what we have worked for for years. But few could perform the difficult task of pleasing sportsmen, rough trappers and hunters upon the frontier, and yet never introduce a single word or allusion that would be found objectionable for family reading for our wives and daughters. Indeed, I think the ladies of my family would sooner give up their fashion magazines than the FOREST AND STREAM. If you can but arouse in them sufficient enthusiasm for out of door summer life to induce them to give our fashionable resorts the "go by" and confine their dissipations to the winter alone; then will you have deserved the blessing of scores of papas. We wish, too, that you would urge our anglers to be less selfish and choose for the summer sports localities accessible to ladies. It is a mighty selfish thing for us lords of creation to go where we can't take our wives and daughters. Again, you don't blow your own trumpet half enough for the present times. Remember, my dear sir, stranger to you as I am, that "whosoever bloweth not his own trumpet, the same shall not be blown."

JAMES ALEXANDER, JR.

REAL ENGLISH BOXING GLOVES,

Imported, and the best American Gloves manufactured by SHANNON, MILLER & CRANE, No. 46 Maiden Lane, N. Y. Fair quality \$3 per set of two pair; fancy and extra from \$4 to \$10.
P. S.—Goods sent C. O. D. everywhere.

PAMRAPO—with its beautiful sheet of water spreading before it, lovelier than the bay of Naples: its situation commanding a view of the Narrows—the gateway of the ocean—forming an ever-changing kaleidoscope of vessels homeward and outward bound. Its banks are dotted with the finest residences, and nestling also under its green foliage the bright painted houses of the several boat clubs, the Triton's and the Bayonne's, enliven the picture. This locality offers inducements for health to the resident and wealth to the investor, such as no suburb near New York can do. Only 23 minutes from New York by the Central Railroad of New Jersey, from the foot of Liberty street. Commutation only seven cents per trip, monthly ticket. Lots and houses for sale. Inquire at FOREST AND STREAM Office, for MR. JOSEPH HALLOCK, for full particulars. je25tf

Orange Sporting Powder.

ORANGE LIGHTNING POWDER,

The strongest and cleanest Powder made. Nos. 1 to 7, packed only in sealed 1 lb. canisters. The coarser sizes especially are recommended to owners of fine breech-loading guns, giving great penetration with very slight recoil.

ORANGE DUCKING POWDER,

For water fowl. Very strong and clean. Nos. 1 to 5. Packed in metal kegs of 64 lbs. each, and in canisters of 1 and 5 lbs.

AUDUBON POWDER,

Very quick. For woodcock and quail Nos. 1 to 4. Packed in metal kegs of 12 1/2 lbs. and 6 1/2 lbs., and in pound canisters.

ORANGE RIFLE POWDER,

The best for rifles and for all ordinary purposes. Sizes F.g, FF.g, the last being the finest and most used. Packed in wood and metal kegs of 25 lbs., 12 1/2 lbs., and 6 1/2 lbs., and in canisters of 1 lb. and 1/2 pound.

All of the above give high velocities and less residuum than any other brands made.

Cut Cavendish Smoking.

Ask your Dealer, or send direct to our

works for a supply of PURE Tobacco.

VIENNA, AUSTRIA, Nov. 30, 1873.

Messrs. Wm. S. Kimball & Co.:

Sirs—A friend of mine sent me, with a transport of Indian Skulls, two pounds of "Vanity Fair," which I declare to be the best Tobacco I ever smoked. We have very good tobacco in Vienna—Turkish and Hungarian, but "Vanity Fair" is the King of all, by its aromatic flavor and the right sort of strength. My friend in New York got an appointment in California, by that reason I apply immediately to you, begging you to send me for the enclosed ten dollars, a supply of "Vanity Fair," and send with the next steamer to Germany. If there is a German firm that sells your excellent "Vanity Fair," I beg you to enclose me the address.

HEGEMAN'S

PORTABLE FOLDING BOAT,

For use as Life Boats, Lighters, Dingies, Dorys, on board of Steamers,
Yachts, and other Vessels, also for Sportsmen, Tourists, Trappers,
Exploring Expeditions, Parties Camping Out, &c.

These safe and perfectly portable boats will admit of the roughest usage. A very light,
strong and durable frame of ash or other tough wood, with canvass cover, and can be
folded in one-eighth space, for transportation, and carried in a light buggy wagon, on horse-
back, or by a single person, and can be unfolded ready for use, in three minutes time.
Boats neatly folded, packed and shipped by express to any address, however distant, at
the same rates of freight as ordinary goods. Address
JOHN HEGEMAN,
Ballston Spa, Saratoga Co., N. Y.

This arm was submitted in competition with over
one hundred different systems, American and Euro-
pean, to the Board of United States Officers, appoint-
ed by Act of Congress, 6th June, 1872, for the pur-
pose of selecting the best arm for the service, and of
which Brig. Gen. A. H. Terry was President. It suc-
cessfully passed through all the tests.

The following is the report of the Board:
"Resolved, That the adoption of magazine guns for
the military service by all nations is only a question
of time; that whenever an arm shall be devised which
shall be as effective as a single breech-loader, as the
best of the existing breech-loading arms, and shall at
the same time possess a safe and easily manipulated
magazine, every consideration of public policy will re-
quire its adoption.

Resolved, further, That the experiments before the
Board with the Ward-Burton Magazine System have
so impressed the Board with the merits of this gun,
that they consider it as more nearly fulfilling the con-
ditions above specified than any other tried by them
or of which they have any knowledge, and it does
recommend that a number of magazine muskets be
made on the plan for further trial in the field." (See
Ordnance Report.)

We are now receiving orders for these guns, and due
notice will be given in this paper when they are ready
for delivery.

The following is our scale of prices: Special Maga-
zine for large game, carrying from 3 to 8 cartridges,
70 to 85 grs. of powder, 350 to 400 grs. of lead, 8 to 10
lbs. weight, from \$60 and upwards, according to finish.
Special Long-range Magazine Rifle for Creedmoor
shooting, 90 grs. of powder, 480 grs. of lead, carrying
3 to 8 cartridges, weighing 10 lbs., from \$100 and up-
ward. Magazine guns for general use, carrying 3 to
9 cartridges, 60 grs. powder, 350 grs. lead, from \$40
and upward. Single Breech-Loader, Creedmoor
shooting, for long range, 90 grs. powder, 480 grs. lead,
from \$60 and upward. Single Breech-Loader for
general use, 6 to 7 lbs., 60 grs. powder, 350 grs. lead,
from \$30 and upward. The calibre of all our rifles,
unless otherwise ordered, will be 45-100. in.
All communications should be addressed to

W. G. BURTON,

Care Ward & Co., 34 Wall St., N. Y.

FISHERIES. ---MADE TO ORDER

SHARPS'
Breech-Loading, Metallic Cartridge
Military,
Hunting,
and Target

RIFLES.

EXCELS ALL OTHERS

—IN—
Accuracy, Strength & Safety

No Premature Discharges Ever Occur.

Special attention is called to their LONG RANGE
RIFLE, weighing 10 lbs., for target practice. This
rifle won the AMATEUR CLUB MEDAL, at Creed-
moor Range, New York, three times, making eighty-
one points out of a possible eighty-four—best record
ever made on the Range. At same Range, Fall meet-
ing, in "All Comers Match" 500 and 600 yards, 75
entries and 10 prizes, the SHARPS' RIFLES took five
prizes with seven guns. At the Opening Meeting,
Creedmoor, June 6 1874, Sharps' took four out of six
prizes in the match for military rifles at 500 yards;
the first and second prizes being won with it by scores
of 27 out of a possible 28.

Every Rifle Warranted a good shooter;
Calibres 40, 44 and 50-100 in., of any length
desired;
Charge of powder, 50 to 100 grains;
Weight of balls, 220 to 540 grains;
Stocks, plain, also pistol grip and checked;
Sights, plain, globe and peep, Vernier with in-
terchangeable front sight and wind gauge.

Price, from \$35 00 to \$125 00.

Every variety of ammunition for above guns con-
stantly on hand. Send for circulars

Sharps' Rifle Manufacturing Co.,

Hartford, Conn.

JOHN P. MOORE'S SONS, Agts.,

June 11 300 Broadway, New York.

IMPORTERS AND MANUFACTURERS OF

Fish Hooks and Fishing Tackle.

Would invite the attention of amateurs to their
large stock of fine goods, specially prepared for the
wants of those visiting the Long Island Clubs, the Ad-
irondacks, Lake Superior, the Maine woods, and the
Black Bass regions. A full stock of their unrivalled
Fly rods for Trout and Salmon, and the famed "Mc-
Ginnis" Black Bass Rods constantly on hand.

Nine Silver Medals and the only Gold one ever
awarded were received by them for the superiority of
their goods.

W. W. GREENER'S

PATENT TREBLE WEDGE
Fast Breech Loader

Indestructible by Gunpowder.

This gun is specially designed to meet the require-
ments of American sportsmen. It will stand a larger
charge of powder, and shoot stronger than any other
system. For duck and pigeon shooting these guns
stand unrivalled. The action is simple in construc-
tion, quick and easy to load. They may be inspected
this season at all the principle gun stores in the Uni-
ted States. Prices moderate.

The second edition of "Modern Breech Loaders,
Sporting and Military," will be shortly published by
W. W. GREENER,
July 2 St. Mary's Works, Birmingham, England.

And published under the auspices of the Cunard
Steam Ship Co. and Brooklyn Yacht Club.

The Compiler has the honor to announce to pro-
fessional Mariners and Yachtsmen that the above is now
in press, and will shortly be published. Price \$2 50.
The Life Saving Stations include the new districts.
The Tide Tables will be very extensive.

The Compilation has been carefully made, and is
complete and accurate.
The artistic and typographical work will be in the
best style.

Subscribers remitting the price of the work, with
name and address, either to the Compiler, to John
Filmer, 292 Broadway, or to FOREST AND STREAM
Publishing Co., New York, will have a copy forward-
ed as soon as published, mailed free. jly2

BARNUM'S
ROMAN HIPPODROME

Letter Carrier's Walk.

ONE MILE.

Open to every Letter Carrier in the employ of
the United States Government, except only
such as are, or may have been, professional
walkers.

For Six Nights,

COMMENCING

Monday, July 6th, 1874.

Each person entering to compete once. The names
on the list of entries will be divided into six divisions,
and one of the divisions assigned to each evening, in
the order in which they stand on the list.

Dress—their uniform.

Prizes—each night—1st, Gold Medal; 2d, Silver
Medal; 3d, Silver Medal.

Monday, July 13th. The winners of the first Prizes
in the six consecutive walks will compete for the
Championship and a Diamond Medal.

Competent Judges will be selected, who will decide
in accordance with the rules governing Athletic Con-
tests, and their decision will be final and without ap-
peal.

Any competitor not at the Judge's Stand when his
name is called will be ruled out of the game then an-
nounced.

Competitors will start at the firing of a pistol, and
in case of a false start a tap of the bell will be given
as a recall, and whoever refuses to obey shall be ruled
out.

Any competitor starting before the signal is given
will be put back one yard, and on a repetition of the
offence will be ruled out.

Any competitor jostling, or willfully obstructing
another, will be immediately compelled to leave the
course.

Unfair walking will be cautioned once, and upon a
repetition the offender will be ruled out.
All entries must be in writing, on or before July
2d, addressed

For Forest and Stream.
THE COMING MAN.

FOOTFALLS sound on the pavement,
Footfalls ring on the floor,
A summons is struck at my portal,
A summons is rung at my door;
And my heart re-echoes the throbings
It oft has echoed before.

He comes with the early songsters
That herald the morning light,
With the glare of the noon and the sunshine,
That for me is no longer bright,
And at eve when the tardy shadows
Are lengthening into night.

From the storm-cloud breaketh the thunder
And falleth the dismal rain,
And the north wind, blown from the ice land,
Howls like a wolf in pain;
But in storm and sunshine and shadow,
He cometh, and cometh again.

Well I know why he ceaseth never
To harrow my tortured soul;
Well I know why my life is haunted,
When the angry thunders roll,
And the forked lightning flashes
Like the light of the Boreal pole.

Well I know why his presence haunts me
Like the wrath of an injured God;
Well I know why my fated portals
By his feet are ever trod;
'Tis the Nemesis of tenants,
'Tis the man with the lightning rod!

J. J. ROCHE.

For Forest and Stream.
Guadalupe.

LA ISLA DE LA PIEL DE ORO, SIN DUDA
ALGUNA.

A WAY midst the snows of the Sierras, in midwinter of 1868, was conceived by a few adventurous Nevadans the project of hunting, for their hides, tallow, and flesh, the wild goats then flocking Guadalupe Island, in the Pacific Ocean, and of supplying their places with a nobler race—the magnificent fleece-bearing Angora goat from Asia Minor. A Mexican citizen was forthwith enlisted in the enterprise, and through him the governor of lower California, Señor Don Carlos F. Galan, was petitioned for the right of entry into possession. The paper presented recited that the petitioner, “a Mexican citizen of the National Guard, desiring to promote the prosperity of his native land, has organized a company with the view of raising Cashmere goats on said island;” that “it has never been inhabited; that it possesses all the qualities for such an object;” etc.; and the petitioner “solicits possession in order to bore artesian wells while the case is under consideration by the supreme government.” [The designation “Cashmere” is a misnomer as above used. The fleece-bearing goats of California are all of the Angora race, which is distinct from the true Cashmere species].

Within twenty days Governor Galan had granted his petitioner's prayer, and in the August following (rapid transfers of interest having in the meantime been made) an agent of the claimants took possession for them. He remained upon the island twenty-two months—alone during most of the time—until relieved early in June, 1870, by a member of the company sent out for that purpose.

Guadalupe Island lies in twenty-nine degrees north latitude, about 190 miles in a southwesterly direction from San Diego, the run to that port being made by schooner in from fifty to seventy-five hours, according to wind and weather. A nearer port is that of San Quentin, ninety miles distant on the peninsular coast. The island is twenty-six miles long, averages ten miles in width, and embraces an area of 166,000 acres. Its general trend is north and south. The northern end is mountainous, the highest peak—Mount Augusta—rising 3,900 feet above the sea level. On this end there is considerable sugar and pine

timber, with palm and some sycamore trees, and an abundance of copious springs, good grasses, and other vegetation. Forests cover some 4,500 acres of the island; the timber is mostly white cedar and pine, and is valuable at San Diego for building, fencing, railroad ties, telegraph poles, wharf and bridge material, and for fuel. The west side of the island is broken into numerous deep cañons, filled with growing palms. On the east side there is a two story frame house (sure sign of *los Americanos*), built by one of the former claimants some years ago, and at other points there are old stone houses of the low-roofed Spanish model. The south end is flatter, but still hilly, and is without running water, though water is found in the rocky fissures after rains. In other parts of the island, besides the numerous living springs, water may be had by excavating from three to ten feet. The beach at various points is frequently alive with the fur-seal and sea elephant, while all the bays abound with barracuda (*Sphyræna barrocuda*), a fish of the pike species, the same as found in the seas about the Bahamas and West Indies, from six to ten feet in length, and with other choice fish, which can be taken in great quantities. The southern extremity terminates in Whaler's Bay, formed by a deep indentation of the island shore, protected in front by a long rocky ledge, with two *buttes* at either end—a capital breakwater. The entrance is from the east, and within may safely anchor the largest ship that floats, sheltered from all winds. Jack's Bay, on the west side, has at the distance of 600 yards from the shore twenty-five fathoms of water. These bays are the frequent resort of whaling and other vessels. About eight miles from the northern extremity of the island on the eastern side, is Espaza Bay, another fine inlet, formerly the customary landing place of the goat hunters. Its anchorage, forty yards from the shore, is fifteen fathoms, and it is admirably sheltered on three sides. During the late terrific gale on the coast in March the schooner Louisa Harker lay to in this safe harbor for several days. In the central portion of the island is the principal range of the goats, though Spring Valley, further north, has a grazing area of five square miles. A deep valley, covered luxuriantly with a carpet of living green, extends from Jack's Bay across the centre. This principal range begins at the corrals and houses used by the goat killers, at a height of 2,900 feet above the sea, and stretches southward on the west side over a *mesa* (table land) covered with spruce timber, and eastward down a long valley; both *mesa* and valley having plenty of clover and alfillerillo. The central section has no running stream, but like the northern part of the island is full of fresh water springs.

How the progenitors of these goats came upon Guadalupe Island is not fully settled. One account says the immense flocks of recent years are descended from a few pairs left on the island in the last century by the famous navigator, Captain Cook. Other writers say the missionary *padres* first placed goats there sixty or seventy years ago. However that may be, certain it is that they are there now, and in vast numbers—so vast that in 1870 they were estimated to number 100,000 head or more. There being no beasts of prey upon the island, and the ewes being extremely prolific, the flocks increase with wonderful rapidity. Thousands have been slaughtered within a few years. In the fall of 1870 alone 7,000 hides were taken, and report says that once 30,000 goats were killed by men from Santa Barbara. Here must have been hunting more abundant than that described by Mortimer Kerry in a late number of FOREST AND STREAM, who tells about hunting the Rocky Mountain sheep near the cascades of the California mountains. The practice has been to ship the skins, tallow, and meat to San Diego, thence to San Francisco, and there sell them. Mazatlan and Guayma, in Mexico, are also excellent soap markets. By 1873, when the island passed into the hands of the present owners, the work of slaughter had only reduced the number of goats there to about 20,000.

During 1869 and 1870—exceptionally dry years—only a few light showers fell. For this, however, the heavy fogs

which almost constantly envelope the higher regions somewhat compensated. Generally the rainfall at the island is more abundant than in either lower California or the southern portion of upper California. In dry seasons the goats subsist mainly upon a species of *chemisal* that is found green all over the island, and thus the damaging effects of extreme drouth are obviated. Indeed, the goat is essentially a browsing animal, the Angora race consuming some forty-five more varieties of aromatic shrubs and plants than any other herbivorous animal. They eat not only with impunity, but with beneficial results, many vegetable growths that are rank poison to sheep and cattle.

In good rainy seasons beautiful growths of nutritious grasses spring up spontaneously late in the fall and grow luxuriantly during the winter, spring, and early summer, affording the finest cropping for the flocks, which require no prepared food. So rich is the soil that nearly all the vegetables and fruits common to this latitude might be produced in great abundance by cultivation. English walnuts, almonds, orange, lemons, limes, citrons, pine apples, prunes, dates, plantains, and all the semi-tropical fruits, in short, besides the grape, flourish on the peninsula as well as on the main land of southern California, and it is believed would grow to perfection on Guadalupe Island. This, however, is a resource yet to be developed.

The climate is not hot, as might be inferred from the degree of latitude. There is frost occasionally, and ice has been seen on standing water there. The sea breezes make the summers delightful, and the salubrity and healthfulness of the atmosphere rival the famed *buenos aires* of San Diego and Santa Barbara. A clergyman from San Francisco spent a portion of the summer of 1870 there for his health, and it is not impossible that the island may yet take rank as a sanitarium with the favorite health resorts of the Pacific coast, now admitted to excel those of Nice, Mentone, and the Rivera, in southern Europe.

But there are objects for future consideration. The immediate and practical value of Guadalupe Island lies in its adaptability for the production of Mohai, or the fine fleece of the beautiful Angora goat, to the growing of which animal it is now devoted. The territory and flocks passed into the hands of the Guadalupe Island Company, an incorporated association of California capitalists and practical wool growers, in January, 1873, and its new owners commenced at once the work of carrying out the original project, viz., the gradual supplanting of the native flocks by the more valuable fleece-bearing race. With this view they sent to the island early in the spring of 1873 their first shipment of Angora goats, embracing fifty of the finest bucks procurable in California (which were promptly “put where they would do the most good”), and sixty ewes for breeding pure bucks to supply future demands. The company's flocks were increased during the ensuing summer by the purchase of fifty more fine bucks and some 1,300 high grade ewes, which latter band was allowed to remain on the main land until the workmen on the island could complete the necessary inclosures for separating the fine from the common stock. The next step in the work of extirpating the plebeian race was to commence the slaughter of all the native bucks, numbering 10,000 or 12,000 head. This was continued throughout last winter. The small force of men on the island have been able to “get away with” only 1,200 head thus far, besides curing their pelts ready for sale to the morocco men, castrating 800 head of young bucks, and completing a large inclosure; but the company will next month put on an extra force to clear the island of the remaining bucks of the common stock, so as to leave nothing but wethers and ewes of this breed to run with the fine Angoras. The carcasses of the goats hereafter to be slaughtered will be utilized to the best advantage—the hams dried, the meats canned, the pelts and tallow properly handled—so as to produce the largest possible results from this source.

The natural increase of these flocks is something wonderful and the results of the recent kidding season, when,

they come to be known, will astonish you. I will send the figures as soon as the "returns" come in.

RESULTS ACHIEVED.—May 12th.—To the description of Guadalupe Island heretofore given (the outlines for which were supplied by goat men who arrived at San Diego from the island) I will now add the results of the kidding season of 1874, recently closed. The facts have been obtained from gentlemen at the head of the project, who report the following substantial results as achieved thus far. The company's first kidding season on Guadalupe Island shows an increase of 100 per cent. from the ewes in their flocks; and the aggregate number of goats, great and small, pure grade and common on the island has been swelled to about 35,000 head. A large number of these have more or less Angora blood in their veins. The previous estimates of the managers, which were based upon an anticipated natural increase sufficient to double the number of bearing ewes every year, have thus been made good so far, and the managers think they have sound reasons for expecting far better results in future years, because the rates at which the superior animals increase become proportionately higher every year as the males of this race supplant those of the common stock.

The condition of the flocks is reported as excellent, and the feed on the range as never better or more abundant. It would support 100,000 goats, say they. The company's men report the grade kids shining white all over the island—the practical result of work done by the Angora bucks since May, 1873. These have taken and held the field against the native bucks wherever the two have come in contact.

This fact would seem to confirm the statement of the well-known traveller, Rev. Henry J. Van Lennep, D.D., for thirty years a missionary in Turkey, and author of "Travels in Little Known Parts of Asia Minor." This author, writing from Angora in 1864, says:—"It is worthy of notice that in particular districts the Angora breed excludes all others." As to the origin of this goat there is much diversity of opinion among naturalists. Cuvier believes the Angora to be descended from *Capra agagrus*, the paseng of Persia. M. Sauc traces it back to Falconer's goat (*Capra Falconeri*), which inhabits the mountains of Tibet. M. Brandt intimates that the race was produced by the domestication of other wild species than *C. agagrus* or *C. Falconeri*. Dr. John Bachman, the eminent American naturalist of South Carolina, in a paper written many years ago and published in a government report, says:—"The varieties of goats are equally numerous and equally varied in different countries. They are all of one species, the varieties mixing and multiplying into each other *ad infinitum*. They all claim as their origin the common goat (*Capra hircus*), which, it is admitted by most reliable naturalists, derives its parentage from the wild goat (*Capra agagrus*) that still exists in the European Alps." Which of these theories may be the true one is not important. The practical fact of consequence to this country is the steady improvement realized in the cross of the pure Angora buck upon females of the common species. When this practice is skilfully and systematically persisted in the progeny improve with each succeeding generation, and all traces of the plebeian blood seemingly disappear after a few years. But care must be exercised by the breeder lest his stock "breed back." The amelioration of the plebeian race is a work of time, requiring the exercise of skill and patience.

How the Angora thrives on this coast may be judged from these facts:—In one flock on the main land, near the Pajaro Valley, not over forty kids of this year's dropping have been lost out of 1,400. I have been shown a letter from a breeder in Oregon at The Dallas, who purchased a small band three years ago. He writes:—"I have been running my goats in a band of 1,500 sheep; all fared alike and corralled together. I lost in the storms 540 head of sheep and not a goat. All the goats came out in fine condition. The snow on my place was fourteen inches deep." The acknowledged success attending the culture of this valuable animal on the Pacific coast has greatly stimulated the production. Many stock growers are going into the business for the first time. One old breeder informs me that he has sold fine and grade breeding goats to the value of over \$7,000 within the past four months.

The rate of increase realized in the Guadalupe flocks thus far will, if kept up, produce in ten years nearly four hundred thousand goats—a result so astonishingly large that I am almost afraid to tell it, lest I be charged with Munchausenism. It should be stated, however, that the flocks will be reduced from year to year by slaughter and sale, so that the island will at no time be overstocked.

Seguramente esta es la isla de la piel de oro! Surely this is the isle of the golden fleece; and these Pacific wool growers be veritable, not mythical, Argonauts, for they are not only seeking but finding, or, what is better, producing

"A fleece more golden than that famed in Greece,
Which ventures Jason on his Argo bore
From the lulled dragon and the Colchian shore."

They have planted themselves on the solid bed rock of a visible, tangible reality. Yours,

BUENA ESPERANZA.

For Forest and Stream.

FORT CAPRON, FLORIDA.

IN a late number of your paper I noticed an inquiry made by a correspondent—from St. Louis, as well as I recollect—asking information with regard to a locality in Florida suitable for the establishment of a hotel. Having served about two years in South Florida during the last Seminole or "Billy Bowlegs" war, I think it probable that I may have it in my power to furnish your correspondent with the information he seeks. I believe Fort Capron, opposite Indian River Inlet, to be the very place for his purpose. Its mild and salubrious climate, together with the abundance of fruit, game and fish to be found in its immediate vicinity, render it a place of unsurpassed attractions for both sportsman and invalid. There is absolutely no endemic disease at this place. Its mild, genial climate banishes all coughs, colds and rheumatisms, while a line of hills in its rear effectually intercept the malarial exhalations of the fresh-water swamps of the interior. The chlorinated vapors brought by the trade-winds, which are constantly blowing from the sea, also exercise their powerful sanitary influence. The abundance of game and fish in the vicinity of Fort Capron is truly astonishing. During the prolonged period that I was stationed at that fort we were never, in the proper season, without game, fish, oysters or green turtle. The fish found in the vicinity are red fish (a species of drum, commonly called "red bass,"

the "rouge" of the Creole French about New Orleans) red-snapper, sheeps-head, cavalls, sea trout, sea mullet, and the far-famed pompano. These two last-mentioned fish do not take a bait. There are also two other remarkable fish inhabiting Indian River and the adjacent coast whose scientific names I am unaware of. These are called by the natives the "Jew fish" and the "Tarpon." The former sometimes attains a weight of two or three hundred pounds, and resembles a bass in its general contour, while the latter presents more the appearance of a doze. The "Tarpon," owing to its graceful outlines and lustrous coloring, is a fish of most surpassing beauty. The scales on its sides are about the size and of the brilliancy of a silver dollar, out of which the native females fabricate beautiful baskets. When a school of these fish are sporting themselves upon the surface of the waves, as is their frequent habit, the bright reflections from their sides produce an effect not unlike that presented by the burnished arms of a squad of soldiers at drill. This fish attains a length of about five or six feet, but is not so heavy as the Jew fish. The bar at Indian River Inlet is an unrivalled locality for short spearing for those who are fond of that thrilling amusement. I have myself, in a common "Whitehall" boat, aided in harpooning fifteen or twenty in a morning. The rivers and creeks emptying into Indian River are filled with black bass (miscalled "black trout" by the natives). This species of black bass reach a much greater size than any other species of this fish I have ever met with. I have taken them weighing in the neighborhood of ten pounds, and I have seen others swimming in the water that seemed to be almost as large again. Like the bass of the Upper Mississippi and lakes of Minnesota, and unlike the bass at present inhabiting the Potomac and its tributaries, it will readily rise to spoon or fly. They are apt to have a grassy taste during the summer, but as winter approaches they have as fine a flavor as any other fish of the genus. The streams which they inhabit, flowing as they do through the sandy soil of the "pine barrens," which contains but little sediment, are almost as transparent as the celebrated trout brooks of New England. Indian River, so called, is not properly a river; but rather a sound or salt water lagoon, being separated from the ocean by a narrow strip of sandy land overgrown with palmettoes and mangroves. It is about one hundred and fifty miles long, and ranges from several miles to forty yards in width. On the east it is fed by several inlets from the sea, through which the tide ebbs and flows freely. Several large rivers enter it from the West, the principal of which are the San Sebastian, Santa Lucia, and Locha Hatchee. No country that I have ever visited affords as great a variety of game and fish as South Florida. Besides large game, such as bear, deer, turkeys, etc., this region literally swarms with snipe and ducks, at least during the winter months. Partridges (bob whites) are also sufficiently numerous to afford sport; but I have never seen a woodcock in that section. The snipe shooting on the savannahs is simply superb. These savannahs (or natural meadows) afford sufficient moisture to attract the birds, without being so miry as to render the walking difficult or fatiguing, as is so often the case at points further north. On one of these snipe grounds of many hundred acres in extent, several miles in rear of Fort Capron, I used to enjoy most delightful sport, seldom returning without a full bag.

I would advise sportsmen desirous of snipe shooting in that section to take pointers instead of setters, for the long hair of these latter are likely to harbor the numerous sanguinivorous insects which there abound; its mild climate is also more suitable to the nature of the pointer.

I have been highly delighted by the eloquent and graphic descriptions of South Florida by your accomplished correspondent "Fred Beverley." "Fred" was mistaken, however, in supposing the Okee Chobee (big water) region to be a *terra incognita* previous to his visit, as the lake has often been explored by officers of the regular army engaged in the several campaigns against the Seminoles in that section. The gallant Captain Gréland, of the Fourth Artillery, once a professor at the United States Military Academy at West Point, now lies buried upon its banks. But your correspondent certainly deserves great credit for the admirable manner in which he has unfolded its mysteries to the general public. Your correspondent makes honorable mention of a gallant exploit of one of his followers whom he calls "Jim." Now, if he alludes to "Jim" Russell, of Fort Capron, (and I am pretty sure he does), I am happy to state that I am well acquainted with "Jim," and have had many a jolly day's sport in his company. After relating another gallant exploit of "Jim's," of which I was an eye witness, I will bring this rather unreasonably prolonged effusion to a close. During a sailboat trip to Morrit's Island in company with Lieutenant, now General, Jeff. C. Davis, of Captain Jack notoriety, and several others, among whom was our hero, we had occasion to take along a famous pointer of mine, "Old Nat" by name, for the purpose of varying our amusement by a little snipe shooting. Now, although "Old Nat's" moral status was none of the best, for he would "steal like a quatermaster," yet his admirable hunting qualities made him a great favorite with all. Like most of his species, he was very fond of consulting his own comfort and convenience. At the fort he was accustomed to sleep in a nice shady spot on my porch, and seeing a similar locality on the boat, produced by the shadow of the main sail, he soon ensconced himself therein. After getting through with his snooze, and thinking himself, no doubt, still in his accustomed spot at home, he suddenly got up, and, much to our surprise and dismay, leaped overboard. As there was a violent gale blowing at the time, the "white caps" running angrily, and, furthermore, as the dog's chain soon became entangled with his legs, his peril became extreme. We luffed up promptly; but in spite of all our efforts the fate of the dog seemed sealed, when "Jim," throwing off his coat, boldly plunged into the seething, surging waves. A few strokes brought him near enough to lay hold of the collar of the drowning dog, but owing to the helpless condition of the latter he could not make much progress on his return to the boat. Owing to the increased violence of the storm we now became aware of the alarming fact that we were slowly but surely falling to leeward, and our fears now became excited for "Jim's" safety also. We shouted to him to abandon the dog and save himself; but the gallant fellow would not do it. By letting the sail fall and using the oars with desperate energy, we were enabled to hold the boat in a stationary position, so that "Jim," swimming with one arm and aided by the waves, succeeded, after a desperate struggle, in coming alongside with the

dog. I soon pulled them both in and we all applauded "Jim" for his manly daring; but to this day "Jeff" swears that I pulled the dog in first; but this, however, I can never bring myself to agree to. A. W. Winchester, Va., June, 1874.

ALL SUMMER IN THE SIERRAS.

BY J. H. BATTY, UNITED STATES GEOLOGICAL SURVEY.

THE entire country knows of the wonders of the Yellowstone, its dizzy heights, its yawning chasms, its boiling springs and spouting geysers. It was through geological expeditions that this valuable accession to our knowledge of the geography of our land was obtained. These explorations were commenced from a small beginning by Dr. F. Hayden, and their past achievements and future aims may be best told in a recapitulation of the Doctor's experience.

Dr. Hayden was born in Massachusetts, graduated at Oberlin, Ohio, in 1850, studied medicine with Prof. J. S. Newberry, the present eminent geologist of Ohio, and graduated at the Albany, New York, Medical College in 1853. In the spring of the same year the Doctor began his explorations by a visit to the Mauvaises Terres, or Bad Lands of Dakota, for Prof. James Hall, of Albany, New York, for the purpose of procuring a collection of the remarkable fossil animals in that ancient cemetery, or great lake basin. He returned late in the autumn with a very large collection, and much important geological information. In the spring of 1854 he started again, and ascended the Missouri alone, and on his own account, on the fur company's steamer from St. Louis, which at that time made a trip but once a year. He was absent two years, without a cent of money from any quarter, having earned his living by putting his hand to any labor that presented itself, and gained the good will of the fur company. He accompanied the leading expeditions among the Indians, and thus secured a great amount of valuable information and a large collection of fossils. The attention of Profs. Henry and Baird, of the Smithsonian Institution, was called to his labors, and they secured a position for him as geologist to the expedition of Lieut. G. K. Warren, United States Topographical Engineers, which explored the Missouri and lower Yellowstone river under the auspices of Gen. Harney in 1856, then in command of the troops in the Sioux war. He remained with Lieut. Warren until the spring of 1859, when he accompanied Capt. W. F. Reynolds in an expedition to the head waters of the Yellowstone and Missouri rivers as geologist. In the meantime he prepared a number of official reports, and published many articles in the various scientific journals of the day. He also collected material for a volume on the languages of the Indians of the upper Missouri, embracing seventeen different dialects, forming a quarto volume of 230 pages, with a map and two plates. This was reported as the longest contribution of entirely new matter to our aboriginal literature that had been made by any one up to that time.

Up to the autumn of 1860 he had explored the country bordering on the Missouri River from Omaha to its source in the Rocky Mountains. In 1861 he joined the army as a surgeon of volunteers, served four years in various capacities, and was breveted Lieutenant Colonel at the close of the war for meritorious services. In 1865 he made another expedition to the great bone deposits of the Bad Lands of Dakota for the Academy of Sciences of Philadelphia, with an order from Gen. Grant on the military posts for such facilities as could be granted without detriment to the service. He obtained at Fort Randall, Dakota, a six mule team, with five soldiers, was absent sixteen days in a hostile Indian country, and returned safely with about a ton of the valuable vertebrate fossils, a portion of which was deposited in the museums of Philadelphia, Boston, and New Haven. About the closing of the session of Congress in the spring of 1867 an appropriation of \$5,000 was made for a geological survey of Nebraska. This was the commencement of that which is now denominated the United States Geological Survey of the Territories. A preliminary report and a finale were published of the survey. The survey was continued from year to year since 1867, the appropriation annually increasing in amount, and the results have been proportionately valuable. Six annual reports, containing entirely new matter, have been published. The publications of the survey, as now organized, will consist of three kinds—the annual reports, which are published in large editions, and distributed to the people; miscellaneous publications, embracing mostly special reports, not suitable for the other two series, and a series of quarto volumes, containing the more original and technical results of the survey. The success that has attended this survey would appear to have entitled it to the confidence of the people, and it is believed that Congress will continue it as a legitimate government enterprise. It is inferred from its great popularity throughout the country that it supplies an existing want, and that its power should be gradually increased from year to year to meet the needs of the government so far as its needs are concerned. The management of the Territories, as well as that of the public domain, is under the Department of the Interior, and it is believed that this great interior survey should remain in that department as an integral portion of the government, and be so regarded and provided for by annual appropriations by Congress. If the survey is so regarded it will continue to be successful, and will send out reports and maps to the people from year to year, increasing our knowledge of the great and wonderful west, and adding to the honor of our country at home and abroad.

After leaving our camp on the Tarryall Creek, we made another camp further up the creek, and then "struck out" across the hills for Crater Mountain, distant two days journey. Our second camp was made three miles from the base of the mountain, and although at so great a distance from camp it appeared to be very near. So clear is the atmosphere in Colorado that the distance of any large object is very deceiving. At that camp game was very abundant. All the streams in the vicinity were obstructed by large embankments made by the beavers, and deer trails were seen all over the woods. Antelope were also seen in bands near the edge of the timber. I succeeded in shooting two black tail does one evening, and as it was late in the day when they were killed, and my horse was two miles away at camp, I concluded to leave them until the next morning. Having dressed one and lifted it into a fallen tree six feet from the ground, I started for camp by a short cut, and, as is often the case, my short cut proved to be a long one. After having floundered in the dark

through mud, willow thickets, and a series of "beaver dams" for two hours, I finally reached camp. The "boys" had a tremendous large fire of cottonwood logs for a beacon, and rolling a log up to the fire for a seat I took off my wet clothes and put on dry ones. When dressed, "the Judge" (our cook) called my attention to a fawn which had been killed by one of our party (known as "Taggart, the unconquerable geologist,") and baked whole for supper in the ever useful dutch oven. When supper was over we turned in, and the next morning I set out with two companions for my deer. We took our little pet pack mule "Mexico" to carry the spoils, and we found it quite a task to persuade her to cross the beaver dams in our course. Having reached the place where the deer had been left, I dismounted, and having walked into the timber a few rods I found the fallen tree covered in places with the coat of the deer, but the deer was gone. Returning to my companions, I told them my deer had vanished, and that there was a prospect for a bear fight. One of our party remained to watch our horses, and the other member of our party and I went in search of the thief, determined to take his skin, whether it was a bear or panther. There were two trails leading from the tree where the deer had been left. Each of us took a trail, and after I had followed mine for about five minutes my companion called out, "Come here." As I approached the place where he stood he pointed to the remains of the deer and said "panther." About one half the deer had been devoured, and the ground was torn up for twenty feet around. There in the loose earth were the large round tracks of the panther, which a hunter is not likely to mistake. The panther must have been a large and powerful animal, as it had carried a full grown doe seventy-five yards over fallen timber. The deer had not been dragged but carried the whole distance, as the teeth marks in the back were plainly seen where the panther had carried it in his mouth, and there was no trail visible where the deer could have been hauled along the ground. There was a large pile of loose earth and leaves scraped together near the body of the deer, and it was evident that the panther had finished his feast, and was about to cover what remained for future use. But hearing us as we approached it had sneaked away before we had an opportunity of trying our rifles on it. We followed the trails of the panther for several hours, but could not overtake it. On our return to our horses we shot another deer; so our journey was not altogether useless.

Nearly all the streams in the mountains run over the rough rocks, making a succession of waterfalls. They are not often seen by the whites, except by miners and hunters, who cannot appreciate their natural beauties. These streams on which we camped are formed by the melting snow banks on the mountain peaks.

Trout are caught in some of the larger streams below the falls, and in some waters they are very abundant. They are, no doubt, a distinct species from the common brook trout of the east.

Rational Pastimes.

Secretaries and friends of Athletic, Base-Ball, Cricket and other outdoor Clubs will kindly mail their contributions not later than Monday in each week.

—The St. George club were not as fortunate on their eastern trip this season as they were last year, the fact being that the New Englanders have improved in their play since then. On July 3d, in the game between the Boston and St. George clubs, played at East Cambridge, the New York eleven were defeated by the appended score, only one innings being played on each side.

—At Salem, on July 4th, the St. George eleven played the Alphas, and the New Yorkers were easily defeated, with nine wickets to fall.

—The Manhattan Cricket Club of New York visited the Prospect Park Club of Brooklyn on July 4th to play their annual holiday match together, and taking over a good team, they polished off the unpracticed Brooklyn eleven in handsome style, to the tune of 153 to 65. The Manhattans were hospitably entertained and they fully enjoyed the same. This is the only match outside their own club that the Prospect Park players take part in, as they play the game for recreative exercise only, and not to win matches. The score shows what was done:

Absolom led the bowlers on the Gentlemen's side, with a score of 168 balls, 78 runs, 8 maidens, 5 wickets, and no wides, W. G. Grace leading on the other side with 6 wickets for 24 runs, and Shand with 4 for 10.

—Yorkshire beat Surrey the same week by 467 to 259. Humphrey's 74 was the best single score for Surrey and Greenwood's 77 for Yorkshire.

—Upperham School scored 443 runs in one innings, June 11, D. Q. Steel getting 166.

—The money taken in at the match for the benefit of the cricketer's fund, played June 4th, was £382, or nearly \$2,000 at a shilling admission.

—In a match last June, S. D. Maul, one of the Uppingham school players, took six wickets for no runs with seven balls.

—The highest score for June was W. W. Pulman's 269 not out, in a Cambridge match.

—Amongst the cricket items of news, it will be seen that the Marylebone Club have decided to charge 2s 6d instead of 1s admission on the Eton and Harrow days, with the view of diminishing the attendance, and increasing the comforts of the members and friends who visit Lord's in such numbers on that occasion.

—The committee appointed by the Philadelphia Cricket Clubs to select a representative American eleven to take part in the grand *fete* at Halifax in August, have chosen the following first class team:

C. A. Newhall, S. Meade, R. S. Newhall, E. Hopkinson, R. L. Baird, J. M. Fox, R. Ashbridge, D. S. Newhall, F. E. Brewster, G. Ashbridge, and R. N. Caldwell, of the Young America, Philadelphia, Germantown, and Marion Clubs of Philadelphia. The substitutes include H. Magee, R. W. Clay, J. P. Newbold, and W. Welsh, Jr. Practice games are to be played in which a strong team will play against the above eleven.

—The Yale and Harvard Clubs play at Glen Mitchell, Saratoga, on July 13th and 14th.

—At New Orleans, on June 26, a very fine game was played between the new Amateur nine and the Lone Stars, resulting in the defeat of the State champion Stars by 8 to 1. The Amateurs only earned one run of the eight they scored.

—The Fleet club of Easton defeated the Actives June 23 by 6 to 0, the best game of the season in Easton.

—The record of the leading championship clubs up to July 7th, is as follows:

Clubs.	Games Won.	Lost.
Boston.....	27	7
Athletic.....	21	9
Mutual.....	17	13
Philadelphia.....	12	11

The Boston and Athletic clubs play farewell games prior to their departure for Europe, July 16, as follows:

July 11—Athletics vs. Philadelphia, at Philadelphia.
July 11—Bostons vs. Mutuals, at Boston.
July 13—Bostons vs. Athletics, at Boston.
July 14—Bostons vs. Mutuals, at Brooklyn.
July 15—Boston vs. Athletics, at Philadelphia.

—The Yales were badly whipped by the Mutuals, July 6, at Brooklyn, by a score of 21 to 1. The fact that the Mutuals changed Matthews for Hatfield in the last two innings alone saved the Yales from a trip by Express to Chicago.

—The professional contests since our last issue:

June 30—Mutual vs. Chicago at Brooklyn..... 8 to 2
July 1—Athletic vs. Chicago at Philadelphia..... 13 to 7
July 1—Atlantic vs. Philadelphia at Brooklyn..... 5 to 3
July 2—Mutual vs. Philadelphia at Brooklyn, ten innings..... 12 to 9
July 4—Athletic vs. Philadelphia at Philadelphia 7 innings..... 12 to 6
July 4—Chicago vs. Boston at Chicago, 10 innings..... 17 to 16
July 6—Philadelphia at Philadelphia..... 14 to 2
July 6—Boston vs. Chicago at Chicago..... 12 to 6

—In the amateur championship tourney in New England the Live Oaks of Lynn stood first, the Grafton Club second, and the Clippers, of Webster, third. The first two have not yet sustained a defeat.

—The Bostons defeated the Blue Stockings at Grand Rapids, Canada, on July 3d, by 36 to 5. Over 1200 people witnessed the match.

—The Roane and Chicago Cricket Clubs were to play a match July 7th.

—On July 3d the Canada champions, the Maple Leaf, of Guelph, defeated the Oneida Club at the Watertown tourney by 13 to 4, and the same day the Eastons beat the New York Fly-Aways by 13 to 7. On the 4th the Maple Leafs defeated the Nassaus of Brooklyn, and the Eastons the Chelseas. On the 6th the Maple Leafs and Eastons were to play for the \$500 prize.

—The opening game of the Maine Junior Base Ball tournament came off at Deering on the forenoon of June 29th, between the Dirigos, of Portland, and White Stockings, of Deering, resulting in favor of the latter club by a score of 30 to 7.

The second game was played in the afternoon by the Mountaineers and Arids, both of Portland—the Mountaineers scoring 38 runs to their opponents 30.

—On July 2d the Harvards defeated the Princeton nine at Boston by 19 to 4.

—One of the most exciting professional contests of the season was that played on the fourth of July on the Union Grounds, Brooklyn, the occasion being the return match between the Mutual and Atlantic Clubs. An old time gathering of spectators crowded the grounds, over 8,000 people witnessing the contest, the final result being the success of the Athletics by the small score of 3 to 2 only. The runs each innings were obtained as follows:

Mutual.....	0	0	0	0	1	0	1	0	0	—
Atlantic.....	2	0	0	0	0	0	0	0	1	—

Total wides pitched by Matthews, 23; by Bond, 13. Time of game, 2 hours and 15 minutes.

—One hundred games of the series of 280 to be played in the professional arena this season have been played up to July 6th, inclusive, and the Bostons still have the lead, with the Athletics a good second, the Mutuals third, and the Philadelphia a grand fourth. The record to date, July 7th, is as follows:

Club.	Games Played.	Won.	Lost.
Boston.....	32	26	6
Athletic.....	29	20	9
Mutual.....	29	12	13
Philadelphia.....	23	11	12
Chicago.....	22	8	14
Atlantic.....	19	7	12
Hartford.....	20	6	14
Baltimore.....	24	5	19

—The Yales came within an ace of defeating two crack professional nines last week, inasmuch as on July 1st they played a 9 to 8 game with the Hartfords at Hartford, and on July 4th a 7 to 6 game with the Baltimore nines at Baltimore.

—The Boston club defeated the Maple Leaf nine at Brantford, on June 30, by 26 to 6, and at Guelph, on July 1, by 20 to 6.

—The Brooklyn Chelseas defeated the Rochester at Watertown, July 26th, 18 to 2.

—The Bridgeport nine defeated the Montagues of Brooklyn, July 4, by 16 to 0.

—The New York Silver Stars played the Newark Stars, on July 1 by 14 to 11.

—The Hartford Amateurs nine defeated the Middletown Amateurs July 2 by 9 to 2 in a prettily played game.

—The Maine Junior Base Ball Tournament was held at Deering, Maine, last week. Five clubs were entered, but owing to bad weather, only eight games were played, with the following result:

Club.	Played.	Won.	Lost.
White Stockings, of Deering.....	3	3	0
Haymakers, of Portland.....	3	2	1
Mountaineers, of Portland.....	4	2	2
Dirigos, of Portland.....	3	1	2
Arids, of Portland.....	3	0	3

—On the forenoon of the 4th, the Androscoggin, of Lewiston (Seniors), beat the White Stockings of Deering 29 to 9. In the afternoon, the Resolutes (Seniors) and Haymakers, of Portland, played the former, winning by a score of 29 to 7.

—A closely contested game marked the seventh match between the Boston and Chicago nines in Chicago, on July 4th, the latter winning by 17 to 16 in a ten innings game.

—At the Watertown tourney, which ended July 7th, the Maple Leaf regular amateur nine of Guelph, Canada, the Champions of the Dominion, and the Easton Club, of Easton, Pa., some professionals, defeated all other opponents, and played together for the first prize on July 7th. The Maple Leafs defeated the Nassaus, of Brooklyn by 13 to 8, and the Eastons whipped the Fly Aways, of New York by 13 to 7, and the Chelseas, of Brooklyn, by 18 to 3.

NEW HAVEN, June 27, 1874.

EDITOR FOREST AND STREAM:—

The past week has been very prolific of games in which College clubs were interested, as the following record will show: Monday, June 29, Yale 16, Princeton 1. Tuesday, June 30, Princeton 13, Harvard 11, Hartford 7, Yale 0. Wednesday, July 1, Hartford 9, Yale 8. Thursday, July 2, Harvard 19, Princeton 4. Friday, July 3, Princeton 14, Hartford 8, Baltimore 15, Yale 4. Saturday, July 4, Hartford 18, Harvard 1, Baltimore 7, Yale 6. These last two games were only six innings. From the above it will be seen that Princeton and Yale have each played five games, and Harvard 4 games, this week. Truly, before Harvard and Yale play in Saratoga they ought to be in excellent practice, and a close game is looked forward to. The betting is now said to be 100 to 75 in favor of Harvard against Yale. It is reported that the first base of the Harvards is to accompany and play with the "Bostons" during their European tour.

—The Athletic Games at Barnum's Hippodrome, inaugurated on Friday, June 26, and terminating Thursday, July 2, proved a decided success, the several prominent athletic societies being well represented by their best athletes. Our friend, Mr. F. J. Engelhardt was, we understand, entrusted with the management of this noteworthy event.

New Publications.

FUR, FIN AND FEATHER. A Compilation of the Game Laws of the different States of the Union and Canadian Provinces. With notes on Field Sports and Angling. Latest revised edition for 1874. Charles Suydam, Publisher, 155 Chambers street, New York.

The compilation of the many and various laws in the States of the Union in regard to the periods when it may be legal or illegal to kill game or catch fish, must render "Fur, Fin and Feather" an absolute necessity to every sportsman throughout the country. In a comprehensive and convenient form can be found the numerous provisions adopted by the various Legislatures, with all the recent changes. It requires no little attention on the part of the most conscientious of hunting or fishing men to keep always within the law, but with this *vade mecum* in their hands the possessors of the book can always find out whether they transgress or not. To "Fur, Fin and Feather" has been added a useful appendix describing the resorts of game, and when and where it can be found in season, and quite an extended list of hunting and fishing localities is given and how to reach them, all of which must render the last edition of "Fur, Fin and Feather" invaluable to those who use gun or rod.

HOLDEN'S BIRDS. By Charles F. Holden. Boston: From the Boston branch house of the New York and Boston publishers we have received this little *bijou* upon singing birds and the manner of taking proper care of them. Said a lady to us a week since: "I love canaries, and would keep them, but I do not know how to take care of them. One tells me this, and another that method, as the right way to use these little pets, and I am confused, rather than instructed. What shall I do?" Go to No. 9 Bowdoin square, Boston, and ask Mr. Holden to give you that little elegant gold-edged work of his on birds, and you will find within its ample pages information upon every subject relating to the purchase, rearing, feeding, and in fact the entire treatment of the canaries and other singing birds, not to be found in any other work of the times.

For Forest and Stream.
TO A CANARY.

HAIL, tiny songster, in thy golden cage,
Flooding the air with melody divine,
What happiness, what rare content is thine?
E'en in captivity thou dost not rage,
As would thy mistress, did a hand restrain
Her liberty, and shut her up like thee!
Thy little breast holds naught of jealousy;
But all the day thou sing'st with might and main
Of the sweet joy that thrills thee; and though none
Shall lend a list'ning ear, thou carest not,
Thou art not discontented with thy lot,
But, swinging in the window where the sun
Sheds warmth and gladness, uttering no cry,
Thou still wilt sing and let the world go by.

R. A. WILSON.

Fish Culture.

This Journal is the Official Organ of the Fish Cultur-
ists' Association.

TROUT GROVE FISHERIES.—This quite well-known establishment is situated some two miles from Randolph depot and about a mile south of East Randolph, in Cattaraugus County. The main pond covers an extent of about five acres of ground; over one hundred springs have been counted. Scarcely any of the springs diminish their flow in the height of the summer, and the temperature of the water is unusually cold. A commodious hatching house, some 24 by 64 feet, is used, with properly arranged troughs and screens, and by means of syphons a constant and plentiful supply of water is had. The rearing ponds are numerous, and adapted to the ages of the fish. The stock on hand at the Trout Grove Fishery at last accounts was as follows: Young fry, 200,000; yearlings, 20,000; two year olds, 2,000; three year olds, 400. In the larger pond are many very fine fish. Mr. Thomas, the Superintendent, has devoted a great deal of time and skill to his fish ponds, and has met with merited success. All the fish Mr. Thomas could raise were sold this spring at remunerative prices. The Trout Grove establishment is quite a recent undertaking, and when all the improvements are completed a large number of trout will be raised there, as the water is in the greatest abundance. We are indebted for many interesting facts in regard to Trout Grove to the *Jamestown Daily Journal*.

The *Revue Maritime et Coloniale* furnishes us with a summary of the sea fisheries of France for 1872. The total product for the year amounts to 74,000,000 francs, showing an increase of 4,000,000. French fisheries are divided into two classes, those conducted on the banks of New Foundland and in Iceland, and those carried out on the coast of France. The products from the foreign sources of fishery are taken by 187 vessels, an increase of some 24 vessels over 1871. The Iceland fishery employs 252 vessels. The shore fisheries of France yielded, in 1872, some 24,204,000 francs. In a prior number we stated the care with which France prepared the statistics of her fisheries, and how Professor Baird was desirous that we should, in the United States, arrive at some determination of the kind and quantity of the fish caught on our shores.

—The aquarium car arrived at San Francisco, June 12th with eleven varieties of the fish on board in splendid order, and the expedition there is considered a great success.

HATCHING WHITE FISH.

CLARKSTON, Mich., June 29, 1874.

EDITOR FOREST AND STREAM:—

Allow me to state through your columns as briefly as possible something of my discoveries in the *modus operandi* of hatching white fish, a native of this State; and as this species of fish has been found to be the most difficult of all the salmonoid family to successfully carry through the process of incubation, I deem it of sufficient importance to lay before your readers.

About November 15th, 1869, through the kind assistance of Mr. Seth Green, I placed 50,000 white fish ova in my hatching troughs in spring water at a temperature of 47 degrees Fahrenheit, at this place, where I was then hatching brook trout successfully. I soon discovered that these eggs were entirely different in their nature from those of the brook trout, for within two weeks' time nine tenths of them had turned white and were worthless, and I was about to abandon them in despair. At this critical time Mr. Green came to my relief, and after a careful investigation we found a small portion had indications of vitality in them, and he advised me to carefully remove all the good eggs, and by this means I succeeded in hatching about two thousand in good condition January 15.

These fish were entirely different from the young trout when first hatched out, as the moment they emerged from their shell they darted off and exhibited a rapid motion in the water, while the latter were quite inactive owing to the fact that young trout retain a large umbilical sack which sustains them some sixty days without food, while the white fish have a very small appendage which is absorbed in about twenty days. These escaped from my charge through the meshes of No. 12 wire cloth down the stream, and I had no opportunity to experiment further with them that year. On the following November, 1870, Mr. George Clark, who is an intelligent and experienced fisherman, kindly aided me in securing the same number of the ova from the Detroit river that I took the previous year. I placed these in the same water as before and succeeded in hatching a much larger proportion; and from my previous experience I selected No. 40 copper wire cloth, which proved effective in retaining them in their troughs. This gave me an opportunity to use all the skill possible to keep them till spring. Soon after these were hatched James W. Milner, U. S. Deputy Fish Commissioner, visited my hatchery, and we decided that he should take home with him one hundred of these swift-motioned fellows, and the balance, being then

some three thousand, were to remain in their hatching boxes. Our plan was to learn what artificial food would best sustain them till spring, as Mr. Green had not yet learned what they required at this infantile period. All our efforts failed, as all died within four weeks, notwithstanding our constant watchfulness over them.

This result quite puzzled me, and I began to study the causes that produced this failure, and as I knew that the water in which the parent fish naturally deposit their ova about the shoals of our great lakes becomes frozen over about the middle of November and remains so until about April first; it occurred to me that the low temperature of the water in which these eggs lay from the middle of November till April first (being at a uniform temperature of from 32½ degrees to 33 degrees) retarded the process of their incubation to the season of the year when the ice leaves the shoals and the animalculæ develop sufficiently to sustain them, which is about the time their umbilical sac, which is absorbed, naturally disappears.

These ideas, which suggested themselves to my mind, led me to try practically and prove the truth of my theory. Consequently I caused to be erected a large hatching house in the fall of 1871, and took water from a pond raised on a small stream which became frozen over early in November and remained so until April, at which time they hatched out. The water that flowed over these eggs during this time stood at a uniform temperature of about 33 degrees. A much larger proportion of these ova hatched out than previously, and remained vigorous and healthy till the time they were planted in some of the desirable lakes of this county. A good number were also placed in the Detroit river. This natural and scientific method settled the question in my mind that I had discovered the only true mode that would result in perfect success.

About the last days of February, 1873, I sent to the Deputy U. S. Commissioner at California over 300,000 well matured white fish ova under the auspices of Prof. Spencer F. Baird, U. S. Commissioner of Fish and Fisheries, and James W. Milner, Deputy U. S. Commissioner, was present, and assisted me in packing and shipping them in good condition. The first lot of these ova, being 216,000, I regret to state were frozen in passing over the Rocky Mountains. The last lot, being 116,000, arrived at the place of their destination in good order.

The next fall this State provided by law for the appointment of a Board of Fish Commissioners, who made arrangements with me for the use of my hatching establishment, and employed me to take charge of it, and we succeeded in placing some 1,700,000 white fish ova in my patent hatching boxes. With the aid of this improved hatching arrangement I was enabled to hatch over 1,500,000, all in the best condition. These were distributed among 194 lakes in different parts of the State during the month of April last.

The above result shows a loss of less than 15 per cent. of all the ova placed in the hatchery, which, considering the uncertainties heretofore attending the incubation of this species of fish ova, it is believed is without a parallel in the world. I have retained one or two hundred of these fish in a small tank, and it has given me an opportunity from practical and scientific observation, of learning the nature of the food which sustains them during this infantile period of their existence, and in due time I hope to be able to report upon the discoveries I have noticed in my diary from time to time. At this date, June 28, these fish, now 79 days old, have obtained a length of one and one-half inches; are active and remarkably rapid in their motion, and will weigh thirty times more than when first hatched out, and we hope further to be able to mark their various changes in growth from time to time.

N. W. CLARK.

CHARLESTOWN, N. H., June 25th, 1874.

EDITOR FOREST AND STREAM:—

May I take the liberty of calling your attention to a slight error (probably a misprint) in your issue of June 18th? In answering the queries of a correspondent on the subject of traveling with live trout you answer "that the temperature of the water in which they are kept should be in the neighborhood of 65 degrees." We never allow the temperature to rise to 50 deg., and if possible keep it below 50 deg. I sent from the Cold Spring Trout Ponds to New York City, and from there to Oakland, in New Jersey, a distance of over 350 miles, about two weeks since, 1,668 yearling trout in five of our conical tanks, capable of holding 130 gallons of water, and only two trout were lost in transit.

A few days since, in reading the French pamphlet published by the *Société d'Acclimatation* of Paris, on what the fish culturists in America have done, I noticed that the Maine salmon, from which Prof. Atkins took spawn, are said to have been kept in pound for some months previous to the spawning season. I have also noticed that every one who has spoken through the newspapers of the California salmon has mentioned particularly the great size they had attained for fish of their age, their liveliness and fat growth, and that in these points they went far ahead of the Maine salmon.

Now I know that the spawn of the California salmon was taken from fish that were seined while on their spawning beds, and the ova taken immediately from them, and would be glad to know if the different circumstances under which the spawn from the two different kinds of fish was taken may not have had a good deal to do with the vitality of the young fish, or is the difference only owing to the fish being of two different species? I should be very glad to have the opinion of some intelligent fish culturist on the subject.

May not the fact of the Maine salmon having been kept (so to speak) in a semi-stagnant condition of life for these months before the spawning season, have prevented the progeny from becoming as full of vitality as they should be? Large numbers of both kinds were hatched in our hatching-house this last winter, and I observed a vast difference in them. Many of the Maine alevins clustered down against the screens, and their yolk sac was continually being drawn through the wires and burst, in this way killing them, and leaving only the head and vertebrae on the inside of the screens. The California alevins were constantly struggling up stream and trying to jump very high cleats, and reach the fall of water at the head of the troughs, making so much noise about it as to tempt me to go and watch them to see what they were about.

The French writer also spoke of the shad spawning, saying that the ova of shad had been found to be worthless, unless the parent fish were captured while actually upon their spawning beds.

All these facts have made me think that keeping the breeding fish in confinement any length of time before the ova is taken, prevents the young fry from being as healthy as they should be.

I have noticed a vast difference in the young of the trout. Those coming from parents fed entirely on curd being weak and puny, and having among them a large proportion of deformed ones, while those coming from parents fed mostly on meal were vigorous and well formed, with hardly a curved spine or double-headed one among them.

F. M. WEBBER.

BOSTON, June 26th, 1874.

EDITOR FOREST AND STREAM:—

Captain Charles A. Ranlett and others, of Bellerica and Bedford, Mass., having petitioned the Massachusetts Commissioners of Inland Fisheries, praying that young salmon might be placed in the Shaushine River, and

fishways be constructed for the passage of migratory fish, in answer to the first clause of the petition, Commissioner E. A. Bracket, Captain Ranlett and your humble servant left the State fishing hatching house at Winchester on Tuesday last, having two large cans of water containing 12,000 young salmon. We rode to the John Cummings' brook, a lively tributary of the Shaushine, and placed there 6,000 young salmon, 600 of which were land-locked salmon. Going thence some three miles we deposited the remaining 6,000 in what is called the Governor's brook, also a clear, cold, brawling tributary of the Shaushine. The little fish soon hid themselves under stones and projections of sod, and will each have its little feeding ground near by. The salmon were placed in the small brooks, that they might be protected from the larger fish. When about six inches long they will drop down to the river. On the second year the migratory salmon will go over the dams to the sea, returning on the third year large fish. They will pass once up the fishways and seek their old home, where they were first deposited; finding the brooks too small they will push on up stream until suitable spawning grounds are reached, then returning to the sea again, completing the round of the law which the Lord has established in the existence of our dumb favorites, and furnishing food for all who seek them.

J. A. O.

FISHWAYS.

WASHINGTON, June 23, 1874.

EDITOR FOREST AND STREAM:—

Much disappointment has been expressed by piscicultural friends at the alleged or supposed failure of the fishways in the Connecticut at Holyoke, and in the Susquehanna at Columbia, Penn., the apparent apathy of the shad in regard to the ascent being considered indicative of a want of proper construction in the apparatus.

There is another view to be taken in this matter. It is one of the axioms of fish culturists, and that upon which the efforts at stocking rivers are essentially based, namely, that the fish return to spawn to the place where they were born, or where they were first introduced into the water. As far as my information extends, no young shad have ever been placed above the Holyoke dam in the Connecticut, and those hatched out at Newport, in Pennsylvania, (above the Columbia dam) have not had time to return from the sea.

The efficiency of the experiment at Holyoke can only be determined by a trial, which were best made during the present season, namely, by planting a large number of young fish, say at Bellows Falls in the Connecticut, and waiting the period of three or four years for the result.

The shad hatched at Newport in 1873 will probably decide this question in two or three years' time. I think it extremely probable that there is something in these considerations, and it will be well not to condemn fishways in general too hastily, as far as shad is concerned, but wait for the result of the experiment. Yours truly,

SPENCER F. BAIRD.

Natural History.

THE GRAYLING IDENTIFIED.

WE have followed up the matter of the Michigan grayling from the date of its earliest introduction to the notice of naturalists, and have, we think, succeeded in establishing its identity as the true grayling, though some of our correspondents seem still inclined to reject the evidence. We have also discovered that the grayling is found in Montana, as well as in Michigan, and that it probably exists in Wisconsin. We know that it exists in sub-Arctic circles. More recently, we have endeavored to compare it with the English grayling, in order to ascertain if it were identical, or an entirely new species, and with a view to consulting the best authority, sent what data and material we had to Jackson Gillbanks, Esq., for many years attached to the staff of Frank Buckland's paper, *Land and Water*. As respects the relative proportions of the English and American grayling, referred to in the sub-joined letter, we will say that the fish in the engraving is much more slender than in life, and it was so remarked the instant it was received from the artist. We take much satisfaction in presenting Mr. Gillbanks' letter to the notice of our readers:—

CUMBERLAND, ENGLAND, June 16th.

EDITOR FOREST AND STREAM:—

Your number of FOREST AND STREAM and letter of June 4th just arrived. If I had no hint whatever on the subject I should have pronounced the fish, so admirably depicted in your paper, to be the grayling, *Salmo Thymallus*, at once. Yarrell's illustration is taken from a fish also ten inches long, which appears to be the average size of a well grown fish. It is some years since I had hold of a grayling, as there are none in the extreme north of England, but I am perfectly acquainted with them and their habits. They are numerous about Buxton in Derbyshire, and although very numerous when met with, they are very local. As far as I know all attempts to hatch them have as yet failed though tried with great perseverance. Their ova will not bear the slightest carriage. Some years ago some gentlemen took some fish from Derbyshire to Scotland and turned them into the Clyde. A year or two after, on enquiry, I was told they had multiplied amazingly, so as to supersede the trout. In other parts of England where they have been introduced into fresh streams, no matter how apparently suitable, contrary to the habit of trout, they keep moving down stream season by season, till at last they have vanished. This fish has the peculiar advantage of being nearly always in season. The best months are October and Christmas. In England they require very fine tackle, a small fly made of a bluish feather from the inside of a sterling's wing, is the favorite one in Derbyshire. But the most killing bait is the grasshopper on a small leaded i. e., weighted hook, "sink and draw." I have compared your wood cut with Yarrell, and other standard works, and find that your fish is somewhat slenderer than his, and has a larger back and tail fine in proportion, but not at all so different as to justify me in pronouncing them to be distinct varieties. There is a much more marked difference in the common trout in different streams on my own estate within a circle of two or three miles. Anatomists insist that counting the fin-rays is the only true test of a distinct variety. Yarrell gives us these for our English fish:—Dorsal, twenty; Pectoral, fifteen; Ventral, ten; Anal, thirteen; Caudal, twenty; Vertebrae fifty-eight. I have been told there is a considerable difference in the appearance of the grayling of different rivers in the west of England, where they are only to be found in any abundance, both in form and coloring, in my opinion an account of different geological conditions. I had a long article on the subject in *Land and Water* about a year ago, headed "Variation of Coloring in Trout." JACKSON GILLBANKS.

WHAT SOME BIRDS EAT.

RUSSELL COUNTY, Kan., June, 1874.

EDITOR FOREST AND STREAM:—

I have noted the contents of crop and gizzard of such birds as I have collected this spring. Thinking it might interest some of your readers, I have made out a list which you can publish if you choose. The birds were collected during the months of March, April and May, namely, several of each species; locality, prairie and narrow strips of timber along the Smoky Hill River, Kansas. Few cultivated farms near. Perhaps in a different locality and in other seasons the same birds might eat different food.

Insects only.—Western lark, mountain plover, burrowing owl, chestnut collared bunting, Western ground robin, field plover, bluebird, yellow billed cuckoo, red-eyed vireo, scarlet tanager, Baltimore oriole, orchard oriole, night hawk, eared grebe, Hudsonian godwit, rail, Wilson's tern-Esquimaux curlew.

Insects and Seeds.—Yellow-headed blackbird, cow blackbird, white crowned sparrows, cardinal, Wilson's phalarope.

Insects, Feathers and Bones of Small Birds.—sparrow hawk.

Insects, Green Plants.—Pinnated grouse.

Insects, Ant's Eggs.—Yellow-shafted flicker.

Sumac Berries.—Red-shafted flicker.

Seeds.—Indigo birds.

Leaf Buds.—Louisiana tanager.

Plants, Water Snails.—Blue-wing teal.

Fish.—Sheldrake, green heron.

Seeds and Insects.—Lark bunting.

I have an eared grebe (*Pardiceps Auritus*) that was killed here this spring. They are very rare, the only ones I have ever seen being this and one other, killed in Northern Illinois last summer. "Jacobstaff" inquires about rail in May. In Davis county, Kansas, May 16th, 1874, I killed a rail (*Porzana Carolina*); male, average size, in good condition. Saw several others the same day.

May 14th I killed a Louisiana tanager (*Pyrranga ludoviciana*) at the mouth of the Saline River. This is the farthest east that I ever knew of their being obtained. Their range is from the Black Hills westward.

Red-shafted flickers were quite abundant during their migratory season. This is about their eastern limit. Saw some hybrids. At present none but golden shafts are to be found.

Perhaps it would interest some of your New Jersey readers to know that, under certain conditions, pinnated grouse are migratory. They were tolerably plenty here last fall, but during the winter not one could be seen. This spring they made their appearance about the middle of April. They were quite abundant for a couple of weeks, then grew less so. I think they went east last fall into the colder settlements, probably driven away by the scarcity of food, as the frost killed insects. As no crops were raised here last year, they had to go where they could find corn and grain fields. F. S. B.

WISCONSIN STATE POULTRY ASSOCIATION.
JANESVILLE, Wis., June 27th, 1874.

EDITOR FOREST AND STREAM:—

Mr. Wanmaker's supposition that black bass exterminate themselves in a period of ten or fifteen years, if not increased by outside supplies, is not borne out by my experience. We have near this place a small lake which was stocked with bass 27 years ago. No fish have been put in it since, and yet the bass fishing is good every year, my brother and I having taken out this month in three hours' fishing, fifty-two fine bass. In regard to the Geneva Lake ciscoes being identical with the much-talked-of grayling, I would say that I have, in common with most anglers of this section, caught many a cisco, and there are peculiarities about them, a knowledge of which may aid you in determining whether or no the cisco and grayling are the same. The ciscoes begin to "run" as we call it, between the 5th and 10th of June, at which time the "ciscoe fly" makes its appearance in great numbers. For a few days after the run begins the fish can be taken in great numbers and the fly is used for bait. Then fish and fly both disappear and are seen no more until another year. They are by no means a game fish in the sense that trout or bass are game, and I never could find much sport in catching them, though they certainly are fine eating. Yours, A. M. VALENTINE.

—In the last report of the *Société d'Acclimatation* of Paris, we find that for 1873, sales of animals were made to the amount of 295,472 francs, on which the profits were 41,204 francs, and that 452,697 people visited the establishment. In 1870, 302,305 francs worth of animals were sold. This was owing to the Prussian war. In fact the collection of animals had to be entirely made up after the war. The society offers prizes to those who propagate new animals or birds into France. We notice that for our prairie chickens, who ever can show twelve birds of this species any time before the close of 1875 in France, bred and born there, will receive the prize of 250 francs. We also see that a prize of 350 francs will be given to any one introducing our hickory (*carya alba*) into the country.

CAVALRY BARRACKS,
ST. LOUIS, Mo., June 29th, 1874.

EDITOR FOREST AND STREAM:—

In your paper of June 25th, 1874, amongst the answers to correspondents, is one to "Idaho," relating to a species of fish found in a small lake, a tributary of the Peyette River. Idaho's description of the fish is correct, excepting possibly to size. I don't believe that he will find many ten pounders among them; but he is evidently mistaken about this fish having only been discovered last summer, for I heard of them repeatedly during 1869, '70, and '71, while in camp at our fort. In 1869 a party of miners prospected the headwaters of the Peyette and Wieser Rivers for gold, and while there caught great numbers of these fish. On returning to Lewistown they brought a small keg-full back with them pickled. The heads and tails were cut off and consequently worthless as specimens. I did not get any on that account. I write this simply to corroborate Idaho's statement that such a fish actually exists there, and that it is of a deep red color: it is not bony and is of excellent flavor. Fish of the best kind are so plentiful in that country that unless it is of the very best quality nobody would eat them. The lakes—I believe there are three of them—are perfectly alive with these fish, and game of all kinds is exceedingly plentiful. The lakes can be reached in about four days travel from Boise City, and should any one of your readers wish to go there to get this fish and all the bear he wants, I can give him the directions. Yours respectfully, CHAS. BENDER, Capt. First Cavalry.

CENTRAL PARK MENAGERIE.

DEPARTMENT OF PUBLIC PARKS,
NEW YORK, July 5, 1874.

Animals received at Central Park Menagerie for the week ending July 4, 1874.

One great Horned Owl, *Bubo Virginianus*. Presented by Mr. James Purnell Toadvin.

One Petz's Connre, *Conurus petzii*. Hab. Mexico.

Four Ground Parakeets, *Calopsita norae-hollandiae*. Hab. Australia.

Two Laughing Kingfishers, *Dacelo gigantea*. Hab. Australia. Placed on exhibition by Mr. L. H. Caldwell. W. A. CONKLIN.

Woodland, Lawn and Garden.

THE WISTARIA SINENSIS.

"Day stars! that ope your frownless eyes to twinkle
From rainbow galaxies of earth's creation,
And dew drops on her lonely altars sprinkle
As a libation."

HORACE SMITH.

IN continuation of the subject of the *Wistaria* as a flowering shrub—too much overlooked in our home gardens, arbor and pot plants—we shall in this concluding paper offer some suggestions for the aid of such of our florists as really and truly love a most beautiful, easily cultivated, and long-lived shrub.

Treated only as a shrub, this plant will fully repay any one in any locality for all the pains he or she shall take in giving it the very best of culture. We are rejoiced to know that within twelve years' time there has been a greater love manifested for this flower, and more thought and care given to its cultivation, than had been given to it during the entire period of fifteen years previous to these last twelve years. For a dwarf tree, grown on the lawn or in pots, it is very easily cultivated. I once had a very fine plant that occupied a prominent place in the centre of a lawn of one acre in extent, and which had been planted in this situation by an oversight of the "man of all work" about the grounds. As a matter of course it was not possible that so fine a plant should stand alone in the middle of the lawn when there was a very fine elevated plateau at the upper part of the lawn, upon the left of a fine drive way, and a little in the rear of the fine dwelling house, which elevation was of some thirty feet, and overlooked one of the finest ocean views in old Massachusetts. This place being just the location for a rustic summer house the plan was suggested, and the work commenced at once, the design being of so simple a plan—the rural Gothic—that soon, under the manipulating saw and hammer of the village carpenter, a pleasant Gothic structure 30x40 feet, with a projecting roof, rose in clear and well defined outlines against the blue horizon. This structure was made of red cedar, at an entire cost of some fifty dollars only, including the *Wistaria* and *Laburnum* planted at the front and at each end of the same. It was recommended to remove the *Wistaria*—a plant of some ten feet stem or trunk—from the lawn and plant it at one end of the structure. Having carefully removed the same with unbroken roots, and carefully planted it in its new home, we trimmed off all the superfluous wood, leaving only six long arms or shoots, which we trained over the roof of the arbor. These shoots, as well as the others from younger plants, made a very vigorous growth the first season planted, and for a compensation for labor expended gave us some fifty or sixty fine blossoms and a luxuriant growth of new wood and brilliant green leaves. It was deemed advisable to plant some two plants of the great *Begonia radicans* at each end, and two golden *Laburnums* to give additional beauty to our rustic arbor. The plants therefore chosen (as they always should be from the best plants obtainable) at the next season gave out their huge scarlet and trumpet shaped flowers, intermingled with the royal purple of the princely *Wistaria* in great abundance, almost covering the entire arbor.

Now our readers, particularly our lady readers, can have all this, or something very like it, at a very moderate expense, and at a less cost than the one we have sketched if they so ordain. No plant that we know of has so many good qualities to recommend it as a combination plant, to be used with other running vine plants, as ivys, honeysuckles, etc., as the *Wistaria*, of which we have two colors, the purple and the pure white. In this application I took what would have made a very fine dwarf tree, and changed all its future by the use of the shears and the pruning knife. It soon forgot its old home, and as a denizen of the lawn, and obedient to the master's will, it easily assumed its rambles over the rustic palings of the new summer house. Suppose we had so willed it that the future life of our shrub should have been that of a tree form, what then? As before advised, prune well, cut back, and make a more compact form of plant, having in your eye the identical form of the tree you would produce. Follow this close pruning system, and you will readily find your dwarf moulded imperceptibly to your hand.

Here at this stage we take the *Wistaria* plant and make it a "pot grower," and to do so successfully requires but the simplest of treatment and the most common of our good soils. Do not commit the error with this plant, often fallen into by many, of giving it too good soil. An ordinary sized pot and common garden soil are all the requisites you need. Again, do you wish to force your pot *Wistaria*, now is the time to do it. This plant only requires a moderate heat to send forth finely developed blossoms in profusion and great elegance, and can be started in the greenhouse, before being placed out, with good results. We think were this mode resorted to by our skilful florists, in a systematic and thorough manner, it would prove a very valuable acquisition to the most attractive plants of the greenhouse. We know of no flower that is a finer bloomer, or of more fragrance or beauty than this.

This plant, when used as a screen, or as a decorative pillar plant, has no equal. It will soon cover an old tree in the garden with a verdure entirely its own. I have often used it to cover a tall pole, upon the top of which was placed a picturesque bird house. Planted at the foot of this support, side by side, was a *Begonia radicans* and a prairie rose, or honeysuckle. It is one of the most attractive ornaments of the garden, and, as a lady friend remarked to me, "so simple; how beautiful; I'll go home and have one made just like it." And she was true to her word, and has had one of these beautiful pillars of life with in her garden for the last eight years.

From what I have already written of this plant, and the many different ways the same may be used as a decorative plant, it will readily be seen that you have a very valuable accession to real ornamental decoration in the garden, as an out door plant, or side or screen plant—a climber which will beautify the tallest mansion, or nestle over the lowest of rustic retreats. In all my practice with covering plants for rustic work of any kind I have found none equal to this. When you use it as an accessory to the more costly adornment of the water landscape, what is so appropriate to throw across the ruins of the old stone bridge, or to festoon the rustic gateway to our porter's humble lodge?

But as we have already made our paper long, we close it with the suggestion that all our friends, if they will only take to their arms the *Wistaria* and study the wants and

capabilities of its truly homelike, simple nature, they will find in our paper a moral as well as a tale in the habits of this "always at home" beautiful plant.

OLLIPOD QUILL.

ANSWER TO EVERETT, OF SALEM, WISCONSIN.—"Are sun flowers of any value?" Not the sun flower particularly, but the seeds have always had a high value placed upon them by many farmers of Ohio, where considerable space is allotted to them. The flowers of the sun flowers always abound in honey, yielding as much or more sweet saccharine matter for the bee than even flax. As an article for bee food you cannot plant anything they like better than buckwheat, flax, and sun flower seed. The seeds of the sun flower contain a very large quantity of an oleaginous matter, at the rate of one gallon to the barrel, and which oil, in its pure state, is quite as good as olive oil. Some farmers have raised fifty bushels to an acre. Horses eat of the seeds of the sun flower quite readily, and for poultry it is thought to be a good stimulant. The American Indians had the seeds in their possession at the same time they had Indian corn, and used them, macerated, for bread, mixed with Indian corn meal. The stalks contain a considerable amount of potash, and should always be burned upon the ground where they grow if possible. OLLIPOD QUILL.

The Kennel.

THE DOG SHOW AT THE CRYSTAL PALACE, &C.

[From our Special Correspondent.]

THE dog fanciers had expected something worth seeing at the Crystal Palace this week, but I think few of them were prepared for the brilliant success which attended the reunion in the shape of a grand entry of 1,187 nominations. This formidable array of names makes the show the largest which the last ten years has produced, and no little of the *clat* attaching to it is due to the fact that the judges names were previously advertised so that subscribers knew to whom they intrusted their dogs.

From the large size of the edifice and multitude of trains constantly running to both stations, bringing every few minutes some hundreds of visitors, the Crystal Palace is admirably adapted for the purposes of the show which was held under canvas at the southern end; the dogs being judged on the terrace outside, on which were constructed rings of movable fencing. The weather was perhaps rather too warm for the dogs and even for the judges, but the supply of water for the one and champagne for the other being unlimited, it was after all more agreeable than a cold and rainy season. The Prince of Wales was not behind hand in his entries, and amongst his favorites were some dachshunds, or German badger hounds, of very beautiful proportions. When I say beautiful, however, I rather over-shoot my mark, as the little hounds are extremely ugly to the taste of every one but connoisseurs. They are becoming very fashionable, and almost interfere with the rage for fox terriers and Highland collies which set in a few years ago. The dachshund proper is black and tan, with a fox hound's head and ears in miniature, though his auricular appendages are never cut short or rounded. His forelegs are as crooked as a ram's horn, and bend in and out in all directions. In his native country he goes to ground to a badger like a ferret after a rabbit, and his pluck and determination is very great.

Amongst the other proteges of the royal exhibitors were the Princess of Wales' magnificent St. Bernard "Hope," given her by the Rev. J. C. Macdona, and a deer hound and Roman boar hound sent by the Prince received special praise. The boar hound was very remarkable, being like the gigantic hounds in old German pictures.

Prince Albert Victor sent a very handsome Dalmatian, or Danish carriage dog, of the sort one sees so many of now in the Park behind the heavy old fashioned Britchka, with coronets on their panels and powdered coachmen on the boxes. The beauty of these dogs is the distinctness and number of their spots, which should be clearly defined even to the end of their sterns; but a few years ago this last peculiarity was rare, and every spot on the tail was worth a sovereign. They are often very sensible, and will occasionally point partridges like the pointer, to whom they are no doubt related, but in my opinion the best dog behind a dog cart is a deer hound or greyhound. Captain Patton Sanders, however, informed me that he has bred a lighter kind of bull dog which is admirably adapted for the purpose.

When I first went on the Terrace the judging of the mastiffs had commenced, and it was worth while looking at them, as the champion class included eight of the best dogs which the world can produce, and I don't suppose that £150 in hard cash would have purchased either one of them, except Miss Hale's Tabias, who was not so good as the rest. The judge was the Rev. Thomas Pearce, author of "The Dog," who was not present at the last year's show; nor did he, I can personally vouch, know either of the dogs he selected, even by name. Nevertheless he placed "Monarch" first, and gave him the prize for the best mastiff of the show, thus putting him in front of "Gramby" and "Breton," two celebrated dogs. This judgment was fully borne out by previous decisions, and it shows how accurate his judgment was, and how settled a thing has become this scale of a mastiff's points and qualities, which he has himself more or less determined in connection with the *Field*.

This breed of dogs has only lately become so numerous. About fifty years ago there were but few specimens extant of the strain that accompanied the British warrior queen Boadicea and her scythe-wheeled chariots. At Lyme Hall, in Cheshire, the seat of Captain Legh, they are said to have

presided since the battle of Agincourt, where a favorite bitch saved the life of her master, but in later times the breed has been crossed. Possibly, as "Idstone" suggested, the mastiff has resuscitated by crossing the gigantic boarhound with the bull dog, the latter of which is very much of the same nature as the mastiff, though the brindle color, which has always been a bull dog color, has now given way to the fawn and black points. The St. Bernard class was a very good one, and nearly all of them more or less traced back to the Macdona importations. They are divided into two classes, the smooth and the rough; perhaps there is no dog about which there are more opinions, and the question whether they should have close claws or not has excited many a fierce controversy in the columns of the *Field*. They are very powerful animals, but utterly incapable of carrying home rescued travellers on their backs, which we see them represented as doing in pictures. Their chief use I take it, is to track them in the snow and find them by their wonderful power of scent, which is equal to the bloodhounds, or should be. The prize for champion pointers went to Mr. L. Price's "Bang," a dog who has proved his excellence in the field as well as on the bench. This shows that good looks do sometimes go with good work. Mr. Whitehouse, of Ipsley Court, Warwick, has the most celebrated strain of pointers in the world, but he was not so successful this time as of yore, though he took several prizes. Mr. Laverack took the champion prize for setters with his old "Blue Dash," who is now thirteen years old, and his "Blue Prince" was second in the open class. In fact, little as I like them, I must own the Laveracks were everywhere victorious, as Mr. Llewellyn's took several prizes with them, and so did Mr. F. R. Henning, the owner of "Peasant Boy," who ran for the Waterloo Cup this year. In retrievers the curly coated class prizes fell to Mr. J. W. Morris, and for wavy coated dogs the second prize fell to "Mentor," an Idstone retriever bred by the Rev. Thomas Pearce. The Harrier class was well filled, but the Fox hounds were absent, as the presence of hydrophobia and dumb madness prevented the owners from sending them. A telegraph board being on the Terrace, the awards were soon made known to the public. The pleasant part of a dog show is that it serves as a meeting place for men of sporting taste. There is a sort of freemasonry amongst fanciers, and they are all "hail fellows, well met." You don't need much formal introduction if you are at all known for any particular specialty. A gentleman comes up to you and says, "I beg your pardon, but are you Mr. so and so, the owner of 'Bang'?" You modestly answer, "Yes," and he asks your opinion about his kennel, listens to you like a junior barrister to a Queen's Counsel, and very likely ends by introducing you to his wife, and offering you a week's shooting on his moor.

The horse show at the Agricultural Hall was a novel attraction all last week; but as most doggy men are not particularly horsey, it did not interfere much with the Crystal Palace. Among the judges of horse flesh were the Marquis of Waterford, Sir George Wombwell, Bart., Lord Shannon, Colonel Luttrell and Colonel Ashley Maud, C. B. On Wednesday the Prince and Princess of Wales, the Duke of Edinburgh and other persons of distinction occupied the Royal Box, and they were both competitors and prize winners. The day for thoroughbred stallions was withdrawn, as the risk incurred by owners is too great to allow the presence of valuable sons of Stockwell, Blair Athol or Marsyas. About four hundred animals were judged, but Mr. J. Chaworth Musters, a popular master of hounds, was absent, as he had met with an accident a few days previously.

The prize of £60 for weight carrying hunters was taken by Palmerston by "Ali Pasha," "Iron King" being second. I liked the look of the winner immensely, as, though he has plenty of size, you don't see it till you are close up to him, from the excellent proportion of his limbs. He is very good tempered, too, and as good a horse to ride to hounds as a man of large proportions could wish to find. The class of hunters, without restriction to weight-carrying powers, was a good one, and there were plenty of covert-hack and roadsters, but most of them priced tremendously high. The park hacks excited much admiration by their beautiful condition and high action. I noticed a splendid stepper, bred in Egypt, and ridden by a lady. He was named the "Beau," and was quite my "beau ideal" of a lady's park hack. His mane and tail were of course luxuriant, and his rich bay color, with black points, neat Arabian blood-like head, and general stamp of quality, made him well worth the £350 asked for him by his owner. Mr. H. Frisby won the prize for the best tandem with his matchless "Empress" and "Eclipse." They were well handled, too, stepping up to their chins and doing, I should say, some fourteen miles an hour. Sir D. Salomons exhibited three horses driven together, tandem fashion, and they were quite a feature in the show, as the man on the box turned them round a post as easily as if he had but one horse, and cut figures of eight in the most innocent manner; but of course much depended on having a well-broken leader. There was but one four-in-hand, and that belonged to Sir Talbot Constable. He also won the prize for phaeton horses under 15.2 with park action. The Duke of Edinburgh won the £10 prize for foreign horses for his iron grey Arab stallion "Livadia." A horse called "Sultan" was also exhibited in this class, who was fourteen years old, and had carried his master, Colonel Bray, eight hundred miles in the Abyssinian campaign. Viscount Valentia, the Vice-President of the Polo Club, and Viscount Cole judged the polo ponies, and gave first prize to "Cockern," belonging to the Hon. T. W. Fitzwilliam, who is so

well known as a breeder of fox terriers, and awarded prizes to that class of dogs at the Crystal Palace.

The leaping I did not see, but the *Field* said it would be a burlesque. At any rate it is generally instituted more to give amusement to the spectators than to really test the capabilities of the hunters. Next week the Eton and Winchester cricket match comes off, shortly to be followed by the Eton and Harrow match at "Lord's." There is also the Oxford and Cambridge match, which is almost equal to it for the 29th. Mr. W. G. Grace playing in the Gloucester eleven did not make one of his usual big scores, as he was first caught out for six and then next innings stumped for thirty-five. He is generally supposed to be as good as an ordinary eleven, and is seldom got out for anything under three figures.

Underhand slows are getting quite fashionable, and there is nearly always a bowler of this description attached to an eleven. This year is the centenary of cricket, and it is proposed to hold a dinner of some sort to celebrate the anniversary of the day when Sir Horace Mann first framed the laws and rules of cricket at the Star and Garter in Pall Mall.

Treat, who ran very decently in the Derby, is first favorite in the grand prize of Paris, and Saltarelle, the winner of the Prix du Jockey Club at Chantilly, will do her best to beat him. Apropos of this horse, it is the rule that when the Prix du Jockey Club is won by a mare, that the young lady who vends bouquets shall bear the riders' colors for a twelve month after the race, and then the fair "Isabella," whose fair figure is so familiar to the eyes of French race-course habitués, saw the yellow and black barred jacket pass the post first, her exclamation was, "Oh, mon Dieu! must I look like a wasp for the whole year?"

IDSTONE, JUNIOR.

Faversham, England, June 19th, 1874.

PORTLAND, ME., June 29, 1874.

EDITOR FOREST AND STREAM:—

Some time since you published the particulars of a brutal outrage in Connecticut, where two valuable and highly bred setter dogs were wantonly shot by a person calling himself a man. You gave at the time your personal condemnation of the act in strong terms that I believe met the approval of every reader of your paper as fully as they did mine.

I wish to relate to you a similar outrage here, in the hope that you will publish it, and think that by placing the often recurring brutalities of this nature before the public you will in time bring about some remedy. A gentleman of this city owned two excellent dogs, each of a pure and valuable breed, and to each of which himself and family were strongly attached. One was a Newfoundland, the other a Gordon setter, (whose father was a prize dog at the Crystal Palace Exhibition in London some two years ago, and was poisoned by some unknown scamp last spring); last week the setter came home badly wounded, a rifle ball had cut off the tip of his ear and passed through his right shoulder, probably crippling him for life, even if he lives, which is still uncertain.

It seems that the two dogs had strayed away from home—a thing unusual with them—and were seen in a pasture in the neighboring town, some two or three miles away; afterwards two dead goslings were discovered in the same pasture. The owner of the goslings upon hearing of it loaded his rifle and "went gunning" for the dogs; he finally found them over a mile away, on another man's property, and deliberately slaughtered the Newfoundland dog, then loaded up again and shot the setter, as he came back to look for his play mate, wounding him as described. The owner of the dogs offered a reward "for the detection of the scoundrel" who shot them, and soon got information that led to detection; he obtained a warrant for his arrest for "malicious mischief," placed it in the hands of an officer and went out himself to find the right man—he found him—the man confessed and was apparently proud of his butchery; the owner's patience gave way and he thrashed the fellow soundly. The shooter was soon after arrested and was brought before our Municipal Court, but, mark the result, he was discharged, the court saying there was not "probable cause" to hold him for trial because there was no proof he killed the dog willfully and maliciously, and that he was justified under our statute which says that a man "may lawfully kill a dog." * * * "FOUND worrying, wounding or killing any domestic animals," etc.; in other words, that if a dog is suspected of "killing a domestic animal," he may be shot at any time, or any where thereafter.

The verdict of the community is, that if owners of valuable dogs have no other protection for their rights, they are justified in taking the law into their own hands also, and punishing those who destroy their property.

Have owners of valuable dogs no rights that cowardly scoundrels are bound to respect?

Yours,

PORTLAND.

P. S.—I understand that the recipient of the thrashing has brought suit for heavy damages against the giver. If there is law for such brutes as this dog-shooter, shall there be none for the dogs?

—The absence of our Kennel Editor for a month past will account for our apparent neglect in answering the queries of correspondents interested in the Dog. Next week we shall be able to attend to their favors, we trust.

A SIMPLE DISINFECTANT.—Roasted coffee, says the *Homeopathic World*, is one of the most powerful means not only of rendering animal and vegetable effluvia innocuous, but of actually destroying them. In proof of this, the statement is made that a room in which meat, in an advanced degree of decomposition, had been kept for some time, was instantly deprived of all smell on an open coffee roaster being carried through, it containing one pound of newly roasted coffee; and in another room the effluvia occasioned by the clearing out of a cesspool, so that sulphurated hydrogen and ammonia could be clearly detected, was entirely removed within half a minute, by the employment of three ounces of fresh coffee. The best mode is to dry the raw bean, pound it in a mortar, and then roast the powder on a moderately heated iron plate until it assumes a dark brown hue; it is in this state ready for use.

Shot Gun and Rifle.

GAME IN SEASON FOR JULY.

Woodcock, *philohela minor*. Squirrels.

Details of pigeon shooting and scores of rifle matches, and other interesting matter, should be mailed so as to reach this office on Tuesday morning in each week.

—Woodcocks are just making their appearance in the markets. Pretty fellows with their delicate rosy brown plumage and long bills, and tucked up legs, suggestive of the first cock shooting, and of \$1.25 a pair. The woodcocks are coming in from Norwich, Connecticut, and from Fulton County in this State, and the first batch from Illinois arrived on Tuesday. Seventy-five cents for a pair of woodcocks is to give them away; (one dollar is about a normal figure.) It is a mighty *skeerce* bird anyhow. A great many people pretend to know where they are, but the experts won't tell. Some few woodcocks you may find on the line of the New York and Oswego Midland Railroad, and they are scattering on Long Island. Alas! for the days of our boyhood, when we shot off the porch of our father's house at Lemon Hill (the park was Pratt's garden then) the last of the Philadelphia woodcock. Those were times when the hand was steady, and the eye was clear, and our best gun was a plain single barrel, but a good one. How many years ago it was we do not like to tell; but once, taking a boat from Newcastle, Delaware, and crossing over to the Jersey shore, with our own hand and the single barrel, and without a dog, in an hour we flushed sixteen woodcocks, and shot twelve of them. We have never done that since and never expect to do so any more. Everybody tells us woodcocks are scarce so far, though those that are taken are sound, plump, and fully matured.

—Woodcocks are in fair abundance in Passaic County, near the line of Bergen, but the cover is so thick as to amount almost to a prohibition. Mr. Shepard, a friend residing in the neighborhood, bagged five on Monday, and missed ever so many.

—Frank Good's fishing and hunting moccasins, advertised in our paper, are rapidly finding their way to the notice and use of sportsmen who read our columns, and receive after every trial unqualified approval.

—The Gun Club, of Chicago, had a day's shooting at Tom Stagg's grounds at Lake View, near Chicago, on July 2d, which proved to be quite an enjoyable affair. The arrangements included a trial of skill in shooting at ten single birds and five pairs, under the regular rules of the club. The principal prize being an elegant gold medal and purses of \$25, \$15 and \$10. The medal is to be held for a year against all club competitors, subject to a challenge with thirty days' notice. Mr. J. H. Turrell was appointed referee, and R. Clark as scorer. The first match was between Messrs. Brice and Edwards at five single birds. In the trial Edwards won by 9 to 8. The Messrs. Hamilton and Wilcox had a similar contest, the former winning by 8 to 7, after which Messrs. French, Ballou and Phillips tried their hands, the result being the success of the former, the score being 6, 5 and 3 respectively.

In the shooting at ten single birds in H. and T. traps, 21 yards rise and 80 yards boundary, the score stood as follows:

H and T traps, 21 yards rise, 80/18 yards rise, 100 yards boundary, 5 pair.

Name.	Killed.	Str.	Name.	Total.	Grand
Turrell.....	10	10	Turrell.....	7	4 17
Brice.....	9	8	Brice.....	9	9 18
Stagg.....	10	10	Stagg.....	9	4 17
Abbey.....	9	5	Abbey.....	4	1 13
Hamilton.....	7	3	Hamilton.....	9	8 16
Wilcox.....	8	7	Wilcox.....	8	8 16
Gillespie.....	8	5	Gillespie.....	5	1 13
Taplin.....	6	3	Taplin.....	3	1 9
Martin.....	5	3	Martin.....	6	3 11
Hiland.....	3	2	Heiland.....	1	1 4
Kenney.....	8	4	Kenney.....	7	5 15
Ballou.....	9	9	Ballou.....	5	2 14
Ennis.....	4	1	Ennis.....	3	1 7
French.....	7	4	French.....	7	4 14
Sollitt.....	5	3	Sollitt.....	5	4 10
Quigg.....	7	3	Quigg.....	5	3 12
Phillips.....	7	3	Phillips.....	7	4 14
Edwards.....	9	7	Edwards.....	9	5 18
Hawkins.....	5	1	Hawkins.....	8	5 13
Waller.....	4	3	Waller.....	4	2 8

The final result was the success of H. Z. Edwards in winning the gold medal. Messrs. Turrell and Stagg dividing second money, and Hamilton third, and French the fourth purse.

—The great pigeon shooting tournament at Detroit, Michigan, commenced on Tuesday, and will continue through this week until Friday evening. Cash prizes to the value of \$1,000 are being shot for. We shall print a full report in our next.

—At Dexter Park, Chicago, on the 26th of June the Kenicott Club shot a handicap pigeon match for two club prizes—a gold medal valued at \$150, and a buck's head of gold, fashioned as a watch charm, costing about \$50. The former is an emblem of superiority in the club, and can be challenged for every three months; the latter becomes the property of the person making the second best score in the match at which it was won. Conditions, ten single rises per man from plunge traps. The champion one-armed shot of the world, Hon. Solomon P. Hopkins, of the General Assembly, killed nine straight birds in fine style. Abe Kleinman, shooting from thirty-one yards, and Tom Wilmarth, shooting from twenty-six yards, tied for the medal on ten birds each, and there were seven nines for the watch-charm. The tie between Kleinman and Wilmarth was shot off immediately at five single rises, and from 36 and 31 yards respectively. Wilmarth won, killing five to Kleinman's three.

The successful competitor in ties for the second prize was J. J. Kleinman, whose record is not marred by a single cipher, and who gave as fine an exhibition of single and double bird shooting as was ever witnessed in this city.—*Chicago Post*.

—There is a family of four brothers, all famed shots, who throw out a challenge to the world to shoot with any similar band of brothers; rules to be those of the Illinois Sportsman's Association, of Chicago, Illinois. The prize to be a family medal worth \$100. An Ohio family wants to take it up, there being five brothers. It looks as if there would be a brotherly match out West between the Price and the Klinnan brothers, they numbering four each.

FINE PIGEON SHOOTING.

LAWRENCE, Kan., June 20th, 1874.

EDITOR FOREST AND STREAM:—

Having noticed in your issue of the 11th inst., an account of a pigeon match which took place lately at or near Detroit, and your query as to whether the winner's score of 16 out of 20 at 30 yards rise, ground traps, had ever been excelled by any member of any recognized club at home or abroad, I beg to call your attention to Nos. 1,068 and 1,069 of Vol. XII of the *Field*, where you will find reports of two matches shot under the auspices respectively of the Gun and Hurlingham Clubs of London, Eng., in which the winner's scores certainly equal, if they do not excel, that of Mr. Long. At page 572, No. 1,068, you will find the report of the 30 yards champion sweepstakes (25 sovereigns each) shot at the grounds of the Gun Club, Nottingham, wherein the winner, Captain Shelley, killed 25 out of 30 pigeons; and at page 617, No. 1,069, is reported the International sweepstakes of £10 each at the same distance, shot at the Hurlingham park grounds. The latter event was won by Count E. de Lambertye, who killed 17 out of 20.

True, in these matches the competitors were allowed the use of both barrels, yet in neither case do I find any mention of their use, and these matches were shot at blue rocks, from five traps, five yards apart, which would, in my opinion, more than counterbalance any advantage to be gained from the use of the second barrel.

In order that your readers may be able to judge somewhat of the relative difficulty of killing the different kinds of birds, I would call their attention to a match shot by the well known Captain Bogardus about the 20th of February, 1871 or '72, in which Mr. N. Doxey backed him to kill 45 out of 50 single pigeons, at 21 yards rise, 1½ oz. shot, and being furnished blue rocks, he killed but 4 out of the first 10, thereby losing out of hand. The record of this match, from which I quote, was cut from the *Clipper*, and unfortunately has not the year appended. I have not the slightest wish to undervalue Mr. Long's performance, which undoubtedly was an excellent one, and would like to know your opinion, after giving the facts above alluded to due consideration.

Here in the West much interest is felt in all sporting matters, and though exiled from the trout region, the sprightly articles of the *FOREST AND STREAM* recall many a reminiscence of the days when we were "thar" ourselves.

Our shooting here is good, ducks, geese, grouse, quail and snipe abounding in their respective seasons. I will mention *en passant*, that a gentleman of this place bagged 28 couple of snipe, and nine or ten ducks before twelve o'clock one morning this spring, and it wasn't much of a day for snipe either.

If any of the friends of the *FOREST AND STREAM* chose to make us a visit this fall we will try and give them an opportunity to "collienate."

A. H. S.

PARIS, Ky., June 26th, 1874.

EDITOR FOREST AND STREAM:—

The following score was made here to-day by the Nimrod Club at wild pigeons, double birds, 18 yards rise, 100 boundary, &c., 7½ pairs birds each:—

Name.	Killed.	Name.	Killed.
C. F. Clay	11	J. W. Kidd	9
C. Woodford	14	J. M. Russell	10
W. C. Goodman	8	W. F. Champ	12
C. A. Keamey	9	M. A. Kinney	10
J. H. Kerr	12	J. W. Ferguson	12
G. R. Bell	5	C. F. Clay	11
C. M. Clay, Jr.	13	M. M. Clay	9
Thomas E. Clay	11		

I send a copy of our by-laws. Yours,

C. A. K.

PHILADELPHIA, June 29th, 1874.

EDITOR FOREST AND STREAM:—

I regret that I should have caused "Old Smedy" the trouble of correcting me. The facts respecting that remarkable shot, as I have stated them, not from my own knowledge, but as they were communicated to me two years ago by a correspondent at Berlin are, happily, not disputed by "Old Smedy," but rather admitted as true, if that gentleman is not much mistaken. The evident object of my statement, was to show by a minute description of the position of the three deer, how strange a course a bullet may take. This being the main point and the only matter of interest in the case to sportsmen, it is quite irrelevant by whom and when that shot was made. By way of embellishment, I recollect that a Herr von Schneider was, some thirty years ago, an officer in the Prussian 4th Regiment of Cuirassiers. In my opinion it would be of no consequence whether a shot like that in question was made by old Emperor William himself, or by the last of his huntsmen. Yours truly,

LEHMAN.

MEETING OF THE AMATEUR RIFLE CLUB.—The Executive Committee of the Amateur Rifle Club of New York met at No. 194 Broadway, on Thursday last, Col. Geo. W. Wingate in the chair. The Building Committee reported that the club-room and lockers on the ground at Creedmoor were ready for occupancy. It was resolved to have a series of six competitions on the 15th, 18th, 22d, and 29th of July, and 1st and 5th of August, open to all native-born Americans. In each competition fifteen shots are to be fired at a distance of 800 yards, fifteen at 900, and twenty at 1,000 yards, the twelve competitors making the highest aggregate score in any four of the competition to practice for the coming match with the Irish eight who won the Elcho Shield at Wimbledon. It was resolved that three markers be furnished each week to mark for those who had been chosen to practice for the team, and that a hundred rounds of ammunition be given to each man. It was also resolved that the President of the club be authorized to supervise and exercise control in all matches, and in his absence, the Vice President, subject to appeal to the Executive Committee. It was further resolved that in the terms for the contest for the long range badge, the number to shoot at 1,000 yards be twelve instead of eight. The committee then decided that the day for the International match shall be Saturday, September 26. After the election of Messrs. Perry, Yale and Edmonston the club adjourned.

—At the meeting of the Liverpool Rifle Association at the Altcar Rifle Range, the shooting was very good. Color Sergeant Ruxton at 200 yards, seven shots, made 28. Corporal Pullman, at 500 yards, seven shots, scored 27. At 200, 500, and 600 yards, seven shots at each range, Private Hinde made 74.

CREEDMOOR.—The anniversary of our independence was celebrated at the range by a sweepstake shooting match. There were seventeen entries. Conditions of the match were 20 shots at the 1,000 yard range. The following were the best scores made:

Name.	Arm.	Score	Total.
General T. S. Dakin	R S	34344430334043403203-54	
J. P. M. Richards	S S	04303344442404030234-51	
Thomas Lloyd	S M	22343303302323204324-48	
Henry Fulton	R S	34443400322342204022-47	
Leon Baeker	R S	32233044240323220440-47	
A. V. Canfield, Jr.	R S	3333400343243332020-45	
John Trageser	S S	33303042244033030440-45	
L. M. Ballard	S S	03303323232323232302-44	
H. Tolley	R S	33330023244343002230-44	
George Crouch	S S	32003033343304333300-44	
Col. H. A. Gildersleeve	R S	00434304420333240030-42	
George Wood	R S	02344400003022002224-34	
P. G. Sanford	R S	23320340230000030230-30	
James L. Price	S S	00000332000034320230-25	

General Dakin's score is a fair one. The weather was objectionable in every way, now clear, now hazy, with a reefing breeze blowing all the time, rendering everything like exact computation for effects of wind impossible.

—On Friday last the Seventy-ninth Regiment met at at Creedmoor. The following five scores led the shooting:

Name	At 200 Yds.	At 500 Yds.	Total.
Captain Ross	23324-14	43323-15	29
Sergeant Irwin	23322-12	32322-12	24
Private Melville	40332-12	32222-11	23
W. H. Jones	23340-12	04033-10	22
H. Johnson	40223-11	22402-10	21
John Cooper	22320-9	22400-8	17

SAN FRANCISCO, June 30, 1874.

EDITOR FOREST AND STREAM:—

We members of Co. E, 1st Regiment, keep up our practice with our military rifles (Sharp's) but have been limited to short ranges lately for two reasons: 1st, practicing for the annual regimental target practice, which is the old-fashioned three shots at a 6 by 2 feet target at 150 yards. The second reason is that our Colonel has challenged the Colonel of the 3d Regiment to shoot 50 men from each regiment for \$500 or \$1,000, and the match will probably be shot in the same manner, so the boys keep up their practice. Previous to this we have practiced at 200 and 500 yards, Hythe or Wingate system, and much of our practice is even now at 200 yards. The last time out one man made 19 points in 5 shots off hand, two 18, three or four 17, and many 15 or 16. A little long range practice has been had by different parties, but it will not do for record, because it has been made with heavy rifles, and is not within the rules. Unfortunately all our long range rifles are heavy, 17 to 25 pounds, and we have not yet got light ones. One gentleman went out last month and fired 20 shots at a target with an 18-inch bullseye, distance 700 yards; sight, globe and peep; position, lying. 15 of the shots were in the bullseye, and all would have been inside a 3 feet bullseye. We have very strong winds here, and a good deal of calculation is necessary in shooting above 500 yards.

We watch the columns of the *FOREST AND STREAM* closely for news, and I am afraid from the signs that the Irish team will get the credit of beating all America, and having to shoot against only one club. Also that our shooting will be confined to the rifles made by Remington and Sharp, without much chance for a test of the relative merits of different classes of guns. I am sorry for this, as many of us are firm believers in muzzle loaders for target rifles. Nor such guns as are made by many first-class makers, which having a slow twist may do good work up to 500 yards, but a rapid gaining twist, such as a few rifle makers have the guides for cutting. When such guns shall come into competition, using the proper ammunition, you will see a fair test between the breech and muzzle loaders, but at present, with a few exceptions, I believe the rifles of Remington's and Sharp's are almost our only long range guns. We received a letter from Rigby the other day, in which he states that his rifles are a rapid gaining twist, false muzzle, and in fact the regular American target rifle in almost every particular. Referring to breech loaders, he says that although they have some which shoot very well in calm weather, yet no one would use them in a match if they could use a muzzle loader. How is that as the result of fifteen years' experience at long range?

G. H. S.

[We beg to state that we have always urged the necessity of bringing into the competition with the Irish team both muzzle and breech loaders of American make. Manufacturers of muzzle loaders have had this match with the Irish team before them for the last four months. If such good guns exist, and we see no reason to doubt it, why are they not tried at Creedmoor? The challenge is one directed not only towards English rifle makers, but looks to finding out the best rifles, muzzle loaders or breech loaders, manufactured in the United States.]

SAVANNAH, GA., June 22, 1874.

EDITOR FOREST AND STREAM.

The third annual shooting of the Savannah Schutzenfest Gesellschaft took place on the 22d of June at their park at Greenwich. The first prize was a punch bowl, valued at \$150. Distance, 100 yards; to be shot for by members of the various military companies, five members from each regiment to make three shots. The following were the scores—15 shots each: Georgia Hussars, 110 3-16 inches; Company A, Savannah Volunteer Guards, 140 1-16; Company B, Savannah Volunteer Guards, 156 10-16; Company C, Savannah Volunteer Guards, 140 3-16; 1st Volunteer Regiment, Blues, 171 14-16; Oglethorpe Light Infantry, 184 8-16; Irish Jasper Greens, 186 11-16; Johnstown Light Infantry, 189 14-16; Johnstown Cadets, 189 14-16; Phoenix Rifles, 191 15-16; German Volunteers, 191 15-16; Chatham Artillery, 204 7-16. The cup was awarded to the gallant Hussars.

The Schutzenfest Gesellschaft now commenced their practice at 200 yards. Targets 3 feet square, 12-inch black bullseyes, with a 6-inch white centre. The greatest number of centres to win. The first prize was won by J. Scholl. The winner on the target of honor was C. Sletztler. The victor of the eagle target was I. Paulsen. The shooting on the whole of our German friends in the South was not equal to their performances last year, when Charleston, New Orleans, and Savannah competed. On that occasion J. P. White, of the Savannah club, scored 316 six-inch cen-

tres in four days, and Major Shipley, of New Orleans, 216.

I have seen some articles on rifle sights in the *FOREST AND STREAM*, but I think the sight on White's rifle which he shot at our Fest in 1873 far superior to any you have described, either English or American. He can readily register the 1-1000 part of an inch with his sight, which may, in a measure, account for his shooting. On the second day of the Fest, between ten o'clock and half-past three, Mr. White made 160 shots, 100 of which were centres. That day he made 20 centres in succession, and the next day 21, which we consider pretty good shooting at 200 yards.

Answers To Correspondents.

C. S. R., Fulton.—Is there any clause in the present game law as amended by the last Legislature prohibiting fishing on Sunday? Ans. Yes; \$25 penalty for fishing on Sunday.

WESTERN RURAL, Chicago.—See correspondent's column in several previous numbers of *FOREST AND STREAM* for various preventives against the bites of insects.

DR. STILES, Poughkeepsie.—Consult Railway Guide for fares to Adirondacks and Port Kent, Maine. Take trouting tackle with flies of July varieties, such as the July dunn, wren-tail, red ant, ibis, &c., and trolling rod with McHarg or Buel spoons.

P. P., Verson, France.—The only revolving arm in use in the United States is Colt's. We have not any adapted to firing shot.

L. H. S., Saratoga.—I am very anxious to get a good hunting dog, but I do not know which is the best, a pointer or a setter, and where I can get one. I will be very much obliged for the information? Ans. A setter is the best dog for all work. We know of two Gordons nine months old, bred in Delaware, that can be bought "dog cheap."

H. S., East Saginaw.—Can you give me any information about the trout fishing around Bedford, Pa., and how best to get there? Not acquainted with Bedford county. It is in the region of mountains and streams, and presumably a good locality for trout. Take Cleveland and Pittsburg Railroad.

C. E., Springfield.—Use Belmont oil for preventing rusting in barrels, but not for a lubricant. For oiling mechanism take the best sewing machine oil.

QUAKER CITY.—Period of military matches not yet decided. For the international see to-day's issue. Every Saturday some match takes place at Creedmoor. Should think a 10-pound Sharp's would answer every purpose, and would advise a change. Can see no danger in the use of the patent wooden-loaders. Powder may be made to explode by very violent compression of air, but not in such a simple machine as you propose using.

W. S. S., West Bedford, Mass.—Please inform me whether or not there is a firm in this State (Mass.) who manufacture split bamboo fishing rods, and precise locality, if such there is? Ans. Don't know of any. Write to H. L. Leonard, Bangor, Me., or to J. B. McHarg, Rome, New York.

H. H. T., Randolph, N. Y.—With regard to the fry of young trout, not knowing how to treat and having to learn it all, would they go in search of food, or will they starve unless food accidentally reaches them? Ans. Take a handful of weeds from the bottom of your pond, and examine it carefully for a moment and you will see how wonderfully nature provides for the young trout with a variety of creeping, wriggling, succulent food that ought to satisfy the voracious gourmand among them all.

P. N. T., Washington.—Is there any good fishing or hunting in Loudoun county, Va., during the months of July, August and September; if so, how can they be reached? What tackle is required for fishing in the Potomac? What would be the probable cost of such tackle? Ans. Loudoun is so near Washington city that it is pretty well hunted and fished. It has been a very good woodcock ground, and would be now, were it not for the pot hunters. For Potomac fishing see *FOREST AND STREAM* June 11th, page 285.

THREE BOYS, Washington, D. C.—1. What will it cost and which is the best route to take to reach the Adirondack Mountains from Washington, D. C., also what is the probable cost per day (including everything) when there? Ans. Via New York, Saratoga, Whitehall and Plattsburg for North Woods, Utica and Black River Railroad for John Brown's Tract. Cost about \$3.50 per day. 2. What outfit is needed as to fishing tackle, clothes, &c.? Thick woolen clothes, stout boots, fly and trolling rods, felt hat, tar and oil; see *FOREST AND STREAM* October 16, page 153. 3. Is there good fishing and hunting, and are there any black flies? Ans. Lots of each. 4. Which are the best months to go; are the guides perfectly reliable, and who would you recommend? Ans. For both fishing and hunting take August and September. Guides generally reliable. Let your landlord select for you. 5. How long will it take to get there? Ans. Three days, via Plattsburg. Take morning train from Washington. 6. Do you think the trip advisable for three boys of 17 years? Ans. Go it, but better take some one who knows the way.

SHRIMP.

BOSTON, June 27th, 1874.

EDITOR FOREST AND STREAM:—

In your issue of June 25th I notice under head of "Answers to Correspondents," in reply to the query of C. W. A., Newark, as to the best method of keeping shrimp, you say "pack in damp seaweed and they will keep 24 hours." The smelt anglers in this vicinity would give up in disgust I am afraid, if they could not easily keep shrimp alive longer than 24 hours. The method usually adopted is to put them, clean and solid, into a box or basket, the latter preferred, and place it on the ice in a refrigerator. I have tried covering with seaweed, mixing with sawdust, meal, &c., but for a handy home method nothing works better, in my experience, for keeping shrimp alive 24 hours—a week in fact—than the ice chest. If you are going to carry them some distance before using, it is well to pack the box or basket in ice. If you are located near the water the best way of all is to have a tight covered basket or a box, full of small holes, so as to allow a free circulation of water, and with the live shrimp therein, anchor it off shore. The Guilford Club, during the smelting season, have always adopted the latter method at Black Rock with perfect success, with the simple difference that the shrimp basket was secured inside a large floating lobster car, and they never were troubled with dead bait, but always found them alive and kicking when wanted, if there was any life in them when put in. The basket or box answers the purpose of a "car," and by its use it was found that shrimp could be kept alive for an indefinite time.

If any of your readers know of any better methods we should be pleased to have them ventilated for the benefit of smelters. EBEN.

—Now is the glorious summer hour when our exchanges come to us smeared and disfigured with the smashed carcasses of June bugs, daddy-long-legs, and beetles, that have been unsuspectingly and remorselessly run through the press and not caught out on the fly.

—Atmospheric perturbations are widespread and frequent. Wiseacres say the comet causes it.

—The St. Louis bridge is finished. It cost \$11,000,000.

A few copies of Roosevelt's "Superior Fishing"—now out of print—may be had at *FOREST AND STREAM* office.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCUCLATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company,

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,
[Post Office Box 2882.]
and 125 SOUTH THIRD STREET, PHILADELPHIA.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty per cent. for five copies and upwards. Any person sending us two subscriptions and Ten Dollars will receive a copy of Hallock's "FISHING TOURIST," postage free.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, JULY 9, 1874.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible. CHARLES HALLOCK, Managing Editor.

WILLIAM C. HARRIS, Business Manager.

CALENDAR OF EVENTS FOR THE CURRENT WEEK.

FRIDAY, July 10th.—Hartford vs. Mutual B. B. C. at Hartford—Indianapolis Trotting Association—State Agricultural Society, St. Paul, Minn.—Pigeon Shooting Tournament at Detroit.

SATURDAY, July 11th.—Triton Rowing Association, Pamapo, N. J.—Boston vs. Mutual B. B. C. at Boston—Atlantic vs. Hartford B. B. C. at Hartford—Beacon Park, Boston, Mass., races—Mystic Park, Boston—Utica Park Association—Scott County Association, Davenport, Iowa—Argonauts and Atlantas, Harlem River, 11 A. M.

MONDAY, June 13th.—Boston vs. Athletic B. B. C. at Boston—Mystic Park, Boston—Utica Park Association—Rochester Driving Park Association—Yale vs. Harvard B. B. C. at Glen Mitchel.

TUESDAY, June 14th.—Boston vs. Mutual B. B. C. at Brooklyn—Mystic Park, Boston—Catskill Driving Park—Utica Park Association—Yale vs. Harvard B. B. C. at Glen Mitchel.

WEDNESDAY, July 15th.—Boston vs. Athletic B. B. C. at Boston—Beacon Park, Boston—Mystic Park Boston—Catskill Driving Park—Goshen Driving Park Association, N. Y.—Society of Agriculture, White Plains, N. Y.—Fairfield County Society, Norwalk, Conn.—College regatta, Saratoga, single sculls.

THURSDAY, July 16th.—Boston and Athletic B. B. C. sail for England—Mystic Park—Catskill Driving Park—College regatta, Saratoga, Freshmen and Universities, races, 6-oared.

FIGHTING CONVENTIONALISMS.

THERE is a vast amount of very absurd conventionalism which wants combating. We impose upon ourselves in the United States certain restrictions, which, if they were not alone stupid in their character, are absolutely injurious in their tendency. This subject we have frequently written about, and it seems to us to be one which, if we would redress, requires constant repetition. Expressed in its simplest form, it is "that we work too much and play too little." All natural impulses within certain limits ought to be followed, and from it we may make this deduction, that although most of us do work hard, and have an inclination to play at times, we are afraid that the play will be hurtful to our business, because our clients, if we are lawyers, or our patients, if we are doctors, or our congregations, if we are ministers, might not like to know that on a certain afternoon in the week we had been sailing in a boat, or taking our stand at the rifle range, or had played a game of cricket.

This absolute narrow mindedness, which imposes chains and shackles on the brain worker, is most hurtful in its effects, and exerts a kind of terrorism on those who are afraid of emancipating themselves. That certain inherent yearning that man has to find relief from pressure exists in every one of us. If not found in physical recreation it too often seeks to allay its cravings in dissipation.

Brave, even heroic, are those who, arriving at the middle age of life, having devoted their best days to commerce, the law, medicine or divinity, do throw aside all recreation, crush even the inclination towards it, and become martyrs to those false tenets which declare that a man shall toil all his life and take no breathing spell.

We know that in England statesmen, lawyers, divines, far past the last period of human existence, to-day still undergo a life of work and toil which an American many years younger, in the same position of life, would break down under. Abroad men seem to mature later, and keep on ripening with advancing years, while with us mental and physical ills seem to carry away our brightest workers just when experience would have certainly given them that higher destiny which their early genius had almost attained. The secret of the premature waste of life in our own men is that they are afraid to seek opportunities for rest.

Take particularly the case of the English clergymen. Do we superarrogate to ourselves that our ministers are nearer to the eternal grace, are more solicitous for the welfare of their flocks, than our spiritual brethren on the other side of the water? But would an American clergyman dare to go on the ball field, or play cricket, or sail a boat, as does our Englishman? And pray why should he not? Is he not made of the same flesh and blood as all of us? The reason in nine cases out of ten why he does not is because a very blind and narrow community would first open their eyes, then chatter, next clamor, and he knows how terrible a thing it is to fight with his bread and butter. If he is a lawyer, who, by his unceasing toil, cares for the life, the honor, or the money of his client, does he seek a day's relaxation, and should his name be announced in a public paper as having been the leader of certain rational sports, the chances are, we regret to say, in the present most absurd state of public opinion, that neglect of duty, incompetency even, would be laid at his door. Of course you cannot carry men out and force them to take rational and reasonable recreation, but the slur and odium cast upon those who do now and then play, by the tyrannical force of public opinion, crushes out in them the very faintest desires they may have to amuse themselves.

It is true we are getting somewhat over this condition of taboo so long imposed upon our professional men. It was a struggle first before those who were engaged in commercial pursuits could shake it off. It has been found that a banker can sail a yacht, or a leading merchant take his week's shooting, and still manage his own business and the interests of others in a perfectly satisfactory way. A little bit of recklessness on the part of our professional men would be of service. Let the community gape and stand aglance for awhile, and it may do them good, for perhaps in the moment of astonishment they may compare their own general humdrum, plodding existence with the lives of those who do the thinking, writing, counseling, tending, and even praying for them. No matter how obtuse this general public may be, it will find that in time it can be just as well served in the long run, perhaps better, by those who can both work and play. It is time that this Philistinism of public opinion, which prevents professional men from taking any amusement, in its narrow mindedness should be held in derision.

A CALL FOR MUZZLE LOADERS.

WE are in receipt of numerous letters from friends and correspondents in regard to the kind of rifle to be used at the coming International Match. Not only California, but all sections of the Union, show their interest in the match. Most of these letters urge that some of the riflemen at Creedmoor should use muzzle loading rifles, and that it is only by means of such arms that we can hold our own with the Irish team.

A partizan of neither muzzle or breech loading rifles, all we have to say is, that those making American muzzle loading rifles seem to us to have been singularly indifferent to having their arms tested at Creedmoor. If muzzle loaders will shoot at long or short distances better than breech loaders, why are they not brought forward? We do not pretend to say that the winning rifle at Creedmoor, whether it be a muzzle or a breech loader, must definitely settle the claims of the particular system of arms, but we venture to affirm that American riflemen will hold in such high esteem the rifle making the highest score at the International Match that a rich harvest awaits the manufacturer of the successful rifle. With inducements of this character, one would suppose that innumerable rifle makers at home would have at least tried their arms at Creedmoor. The most perfect apathy has existed on the part of the muzzle rifle makers. From personal experience we can cite but a single exception. We know of a case where a most intelligent country gunsmith, famed for making a very excellent rifle in the western portion of the State, came to New York some three weeks ago, and tried his rifle at Creedmoor, and made a most creditable performance with his arm.

As for ourselves, we must declare that we have taken no small amount of personal pains to encourage any attempts that have been made by makers of muzzle loaders to introduce their special arms at Creedmoor. It is true we have received numberless letters from rifle makers and their friends, and we have forwarded innumerable copies of the regulations of the National Rifle Association, but somehow or other—certainly not from our fault—no results have been attained. Our experience so far has been, that though our country makers produce rifles which are

miracles of skilful handy work, they are either ignorant or indifferent as to the other requisites necessary to bring out all the best shooting qualities in their arms. Accurate measurements of distance they do not seem to care for. A few rods more or less they think will make no matter of difference. They are even inclined to smile in an incredulous fashion at the extreme care with which our most skilful marksmen load their arms. A few grains of powder more or less is of no moment to them, and as to the bullet, whether it be perfect in form or swaged, country rifle makers think has little to do with the accuracy of the flight of the projectile.

We beg to state then to our numerous friends, those desirous of having muzzle loaders fully tested, to direct their efforts towards inducing the manufacturers of such arms to place themselves in prominence, and we promise to give them every assistance in our power. As we have written before, if any one can convince a member of the American Rifle Association, that in absolute shooting, any particular muzzle loader, coming within the regulations at Creedmoor, will make a single point on a score better than a breech loader, such simple proof will make him discard his Remington or Sharp, or Ward-Burton or Ballard.

It is puerile to attach any blame to our leading breech loading rifle makers for putting their arms in prominence. They would be worse than stupid did they hide their light under a bushel. The mistake most of our correspondents make is, to think that certain guns or any guns run Creedmoor. There are no restrictions; the range is open to all and every kind of arm. Only show, as we said before, the members of the National Rifle Association that any special rifle, whether muzzle or breech loader, can perform better than another arm, and such a weapon will be in instant demand. We would guarantee that if on any two matches at ranges over 500 yards, a rifle was used, manufactured by a maker whose name during the match could be concealed, which would beat all others in the match, it would find purchasers in sufficient quantity to keep the maker busy for the next year.

We say then, bring on your muzzle loaders, urge on the makers to come and try them, or put them in the hands of experts, so that we may see the practical results. The proof lies in the test.

So that we beat the Irish team, we are indifferent as to whether the gun be a muzzle or breech loader. We would advise all our rifle friends to read the report of the last meeting of the Amateur Rifle Club.

THE OSWEGO CONVENTION.—The Syracuse Journal of last week says of the Convention recently held at Oswego:

Now that the Convention has passed, a proper inquiry is, what was done for the protection of fish and game? The question is easily answered—Nothing. As a pastime for trap shooters, it was moderately enjoyable; but we venture to say that not one seine less will be drawn during the season because of any action taken by the convention. All through Central New York there have been most flagrant violations of laws protecting fish, but we do not know of a single instance, except one, where any attempt to bring the offenders to justice was made, and in the exception referred to the attorney of the sportsmen who brought the suit, failed to put in an appearance at the trial, and judgment was therefore given to the defendant. Both fish and game are more indebted for protection to the Legislature, game constables and to informers, than to many of the clubs purporting to be organized for such a purpose, and until trap shooting ceases to occupy nine-tenths of the attention of such clubs, game and fish will continue to receive very little attention from them.

The foregoing strictures accord exactly with the views we have repeatedly advanced in the same connection. There is certainly an incongruity in an organization which calls itself an "Association for the Protection of Game" resolving itself once a year into a convention of trap-shooters. The Association is in duty bound to abandon either its name or its practices. Individual clubs have the right and prerogative to select their own pastimes, but an aggregation of these clubs—effected for the express purpose of securing, through the wisdom of combined deliberations, the best legislation for the protection of game and fish, should live up to its profession of faith and ostensible calling. By a neglect of these duties, and perversion of its avowed objects, it cannot but lose its influence with those who have given it their confidence. An organization dignified by the title of "State Association for the Protection of Game," is naturally regarded by people abroad as a purely deliberative body, similar in its composition and aims to the "American Fish Culturists Association;" and from whose annual proceedings it would do well to take pattern. To compel the respect of law-breakers, our officials must at least wear the wig and gown, and not deliberately assume the motley and fanfaron of the ring.

CHANGES OF TROOPS IN THE DEPARTMENT OF THE MISSOURI.—To our numerous friends in the service on both sides of the Mississippi the following changes in the commands as to localities may be of interest:

The 3d Regiment of Infantry, now serving in the Department of the Missouri, have recently received orders to move to the Department of the South. They will proceed by rail to St. Louis and from there to Holly Springs, Miss., where they will encamp till the fall. The 19th Regiment, now in the South, have been relieved, and are now on their way to relieve the 3d. On their arrival in the Department of the Missouri, the companies of the regiment will be stationed at Forts Larned, Dodge, and Wallace, in Kansas, at Camp Supply, Indian Territory, and Fort Lyon, Colorado. The 6th Regiment of Cavalry, now in Kansas, has orders to relieve the 5th in Arizona, but the movement has

been postponed till fall. In the Department of the Platte the 8th Infantry will change with the 23d in Arizona, and the 1st Infantry on the lakes will change with Stanley's 22d in the Department of Dakota.

THE MUSKOKA DISTRICT.—In our advertised list of summer resorts, mention will be found of one whose name is euphonious but altogether unfamiliar; and yet it is the most accessible, the cheapest, and most prolific in genuine sport, of any we have yet had occasion to visit or refer to. This is the Muskoka Lake region, which comprises a chain of lakes and net-work of rivers that abound in three pound brook trout, salmon trout, black bass, and pickerel, some of these localities almost virgin in their primitive wildness, and yet nearly all accessible by railroad and steamboat, in forty-eight hours from New York, *via* Toronto and the Northern railroad of Canada. The chief among them are lakes Simcoe, Couchiching, Muskoka, Rosseau, Joseph, Nipissing, (the first four navigated by the very excellent steamers advertised in our paper,) and the Muskoka and Magnetawan rivers. By this route the tourist can go to Georgian Bay. These lakes are no fish-ponds. Simcoe is thirty miles long, and the rest are of pretentious size. And while the most remote are inhabited only by the Ojibewa Indians, there are handsome towns of several thousand population on the others, that furnish every comfort to invalids or parties not desiring to camp out. One can take the round trip in the steamer, or he can leave the city of Orillia on one morning, steam away off into the wilderness, camp one night, and return the next evening. The round fare is only \$6, ticket good for a month. This district, although familiar to residents of Toronto and the immediate neighborhood, seems to have been a sealed book hitherto to citizens of the United States, and is not even mentioned in any tourist's guide. It was not until this year that any special effort was made to bring it to the notice of sportsmen. We are proud to be able to print in our columns its first published announcement. Those of our readers who follow our advice in this matter, will have occasion hereafter to thank the Hon. A. P. Cockburn, M. P., for the very servicable and comfortable means he has placed at the disposal of the public for reaching this freshest and most attractive region. Intending visitors should take night train to Niagara Falls and Toronto. We will furnish descriptive pamphlets to those who wish them.

A PIPE.—Sometime ago we published for the benefit of smokers and the world in general an invention of our friend "Piseco" for coloring pipes in the most elegant way. The process was to fill the pipe with tobacco, light it, of course, and then make water power do the smoking and artistic tinting. Very few inventions spring from a man's head-perfect, as the patent Minerva did from great Jove's brain; hence, we have more than once been fearful that some of our friends might burn tobacco in vain by the hogshhead-full and get no results. The other day the inventor of this process showed us his pipe—a great, big, capacious, wonderful one, carved into almost animate life, representing a fox making his way through a thicket, and ogling two birds cooing, all unsuspecting of danger. The skill of the artist was marvellous—but the coloring was surpassing! It was of the softest, most beautiful shades of purple, umber and chocolate. In fact it was a pipe so perfect that to carry it in one's mouth would cause the smoker to be stopped every five minutes like a handsome nurse-maid carrying a pretty baby. That pipe was the achievement of the patent process, the automatic water-smoking arrangement described by us some time ago. In Thibet they pray to the grand Lama by means of water power; the smoking American can color pipes in the same way.

THE CHICAGO GUN TRIAL.—We beg to acknowledge the receipt of the tables of the shot gun trial at Chicago, as published by the *Field and Stream*. We are prevented by the pressure on our columns from publishing them in detail. We beg to state that we by no means consider such statements of performances of guns as conclusive, or tending to decide the comparative excellence of any gun. In the Chicago trial, undoubtedly, charges and shot, and thickness of paper were the same for all, but what we require, in order that a comparison may be made between the guns in New York and Chicago is, that the same kind of paper shall be used at all gun trials. Pattern may be had most any way, but penetration is a more difficult question. We consider ourselves, then, at sea on this subject without any fixed standard of rules.

We beg to state that the Chicago trial, as reported in the *Field and Stream*, appears to us to have been well managed, and the tables are carefully and systematically given. We add to this brief summary of the gun trial a letter from one of our correspondents on this subject:—

JACKSON, MISS., July 2, 1874.

EDITOR FOREST AND STREAM:—*Field and Stream* of June 27, is before me with the Gun Trial of June 4th, 5th and 6th, at Chicago. There is some excellent shooting recorded, especially when taking the explanation of the *Field and Stream* editor into consideration; the pads used being 240 lbs. to the ream heavier than those used at English trials.

I do not intend to say anything about the superiority of one gun over the other, but must mention the only muzzle loader shot at the trial which was simply nowhere; the gun is a Jos. Manton, and, while its penetration is as good as the most of the breech loaders, its pattern (distribution of shot) is so miserable that the poorest breech loader beats it 19 pellets and the best beats the Manton 103 pellets, its average being 88; what a comment on the gentlemen who stick to what they are pleased to term their "old potmetal," meaning muzzle loaders, as superior to breech loaders in shooting.

One lesson I learn from this trial is, that it is folly to handicap a gun in regard to amount of powder, or to prescribe the weight and number of shot for the different size guns. Here is where I think they make the

mistake at the Chicago trial. One ounce of shot is not enough for a ten bore but just the thing for a twelve bore; in regard to powder, let them use the same make and grain, but allow them to shoot any quantity they see fit, from one drachm to a pound, provided the gentlemen using the latter quantity give timely notice to those standing around.

Glance at the record and you will see that the difference of one-fourth of a drachm of powder makes quite a difference in favor of some and damages the shooting of others. A gentleman and sportsman of high standing wrote to a friend some time since that he found, when testing an English gun just received, that the charge of powder and shot as marked on the case, was the very worst for the gun that could have been suggested.

The only thing the trial has shown is, what the different guns can do with four to four and a quarter drachms of powder and one ounce of shot, and I dare say not a single gun there showed what it is capable of doing, when loaded to its tried capacity, and not, as I said before, handicapped.

Yours truly,

G. C. E.

Sporting News from Abroad.

[FROM OUR SPECIAL CORRESPONDENT.]

June 26.—The iron net which the last fifty years have woven so tightly and flung so skilfully over hill and dale, imprisoning our rural villages, corn fields, and orchards, our crowded cities and scattered hamlets, has gone far to demolish those brilliant coaches and teams which were the pride and admiration of our ancestors. Where are now the horsey looking, close shaven old knights of the whip, in the smallest of trousers and largest of coats, who pulled up their four bays so jauntily at the bow windows of the roadside taverns, and quaffed huge bumpers of foaming ale from white hands of rosy blackeyed barmaids? Where is now the "high-flyer," that famous coach of yore which started from Salisbury twice in every week, with old Joe Evans on the box, with a conductor on the knife board who blew his yard of tin like any trumpeter? The roaring smoking engines burst forth in their tunnels from the very bosom of the earth, and in vain poor old Joe double-thonged his wheelers, and let his lash fall down his leaders' flanks, he couldn't do more than fourteen miles an hour, and his steaming rival did fifty, so he gave it up, and his old wagon is now tinderwood, whilst the daisies are growing over its potent driver's grave. Ah me, the coach in those days was a sight to see, as it left the old house's gate-way, as spick and span as red paint and varnish could make it. There were mail bags and blunderbusses to guard them, and a luncheon box and fish hung on the lamp irons, and the tits which gladdened the coachman's heart were pawing the ground, as blood one's do, and plunging at the bits, till Dick or Joe or one eyed Bill Chifney gathered up his ribbons, and sprang lightly to his seat. "Let 'm go," said he, like Napoleon giving orders to his guards, and in a twinkling the ostlers stripped off the yellow half clothes and away they rattled at a slapping pace.

For years, however, coaching has languished, and it has only shortly met with a real revival. During the past few days we have had four of those grand sights in the park, which are so characteristic of our Anglo Saxon blood. The Four-in-hand and The Coaching Club, have each held the opening meets with marked success in point of attendance of members. The senior club was started some twenty years ago, though it has only lately been in a flourishing position. From the nucleus of a few energetic sporting spirits, the Duke of Beaufort, a well known master of foxhounds, the best whip and perhaps the best man in the saddle of his day, has invested the club with an importance which makes its meets one of the greatest attractions to beauty and fashion of our London season. We have lost Mr. Morritt, whose yellow coach and roans were a distinguishing feature, but we have a worthy successor to him in Lord Aveland and Colonel Armytage. The Coaching Club is in its third year, and has over seventy members and can turn out fifty coaches at a meet. On its opening day they numbered thirty-three, and showed considerable improvement over former years, though some of the old school said they saw too much of the harness and too little of the horses. I disliked, too, the bearing reins, which are a thoroughly cockneyfied institution, and I prefer to see a horse driven on the cheek to seeing his mouth pulled to pieces with the rein on the bar. If you see a barbarous bit, a nose strap, and heavy curb-chain, look at the man's hands, that's where the fault generally lies. Ten years ago such meets as these were scarcely recognized. Now it requires policemen to keep the ranks, over two miles of park and streets, and but for their energy the coaches could make no parade at all. Formerly the rallying point was the Apsley house, then the Marble arch, and now it is the Magazine, and the dinner takes place at Greenwich. Ascot this week will probably be patronised by a good number of drags and the "turn outs." These are always noted for their style and splendid appearance. Coaches now run from Rochester to London, under Colonel Haworth's care. Tunbridge Wells (forty miles) is kept open by Lord Bective and Colonel Hawthorne, and Mayor Withington runs a coach to Dorking. But it must not be supposed that a long purse, a good family, and a name with a hand to it, are certain proofs of good driving. Indeed they are often far from it. Of course Lord Poulett was all these with his well matched team of blacks, Lord Carrington had command over his rather leggy "flyers," and the Duke of Beaufort, who cares more about work than show, handled right well his strips of leather. But more than one noble coachman is not only nervous but unpractised. It is the whip that bothers them. "Look at that swell, master," whispered a critical bus driver mine ear. "Wh y, the whip is in his way." And sure enough his hands seemed too full; some of them actually

tied the thong to the handle before starting, others made casts as if they had got a salmon rod, and in one case the boxwood might have been a mop or a billiard cue. No man should ever try to drive till he can use a whip, and not one man in twenty can. "Don't keep flicking the horse with the whip, my boy," said an old stager to me when I first learnt driving; "hit him like this from the wrist and you won't break the quill at the top." Thereupon he let the white leather fall, and though it was only a gig whip, he drew blood on the old slug I was learning with, who then and there burst into a smart trot and never wanted another touch for an hour.

What strikes the spectator's eye as well as the grand display of horse flesh, harness and carriage work at one of these gatherings, is the elegance and taste of the women on the drags in that expensive but necessary article, dress. These aristocratic beauties certainly hit off the right shades in a most charming manner, and it matters little whether the body of the vehicle is cobalt, orange, or vermillion, their costumes and dainty Parisian bonnets look equally "*recherché*."

The Prix du Paris, worth about £5,500, fell to an English horse in the shape of Trént, who ran in passable form, in the English Derby. The French were very confident of success of their crack mare Saltarelle, but Cannon held her tolerably safe throughout and landed an easy victory. There was a bad accident during the race, occasioned by some man, as often is the case, foolishly trying to cross the course, the Lord knows why, before the two last horses came in. They bowled him over and carried him some yards between them, and he was picked up and carried away insensible, frightfully bruised and knocked about. There are always some of these unfortunate imbeciles, who risk life and limb for no possible motive, just as you see men, who jump out of a train before it stops, or blow down one gun barrel whilst the other is on full cock. The French "upper ten thousand" are beginning to think horse racing on Sunday rather a mistake, and the correct thing for them to do is to draw up in a splendidly appointed barouche, about three hundred yards from the judges' box and merely talk to their acquaintances, without seeing anything of the race.

Those sportsmen who have large kennels of dogs will be glad to hear the Spratt's Biscuit Company have determined on opening an agency in New York for the sale of their dog biscuits, if they can get them to America on payment of a moderate duty. These biscuits have received most flattering testimonials from owners and breeders of English dogs, and one gentleman even recommends them for feeding horses on a journey. It is a well known fact that coarse and unsavory food, such as sheep paunches, greaves and horseflesh more or less tainted, as they generally are, very frequently destroys for the time the powers of scent in the setter, retriever, pointer, or foxhound, and this serious defect in feeding dogs on artificial food is got over by the use of these biscuits. To test the proof of the assertion that strong smelling viands impair the nose, eat yourself some garlic and onions, then ask your chemist for a bottle of eau de cologne, and another like it full of patchouli, or rondeletia, and see if you can tell which is the latter. It will puzzle you amazingly. How then can you expect your black and tan setter, who has stuffed himself with strong smelling carrion, to discern between the delicate scents of larks and snipes, and eschew the one and stand to the other? On the highland moors where the kennels are perhaps twenty miles from a railway station, these biscuits have been found invaluable, as they occupy a small space in luggage and keep forever, besides not requiring any boiling or other preparation like barley meal and greaves. I have no doubt but that they be found equally servicable on the prairies. As to dogs doing well when fed on them, I may mention that they are in use at the dogshows throughout England, and I personally tried them, and though I am fond of changing a dog's diet, and giving him boiled green food, skim milk, and potatoes in addition to biscuits, yet I think for "the staff of life" in a dog nothing beats them.

During these hot months croquet is almost an indispensable accomplishment. The popularity this game has obtained is unprecedented, and it is now quite as much an institution as cricket, football or polo. Last year there was an attempt made to supplant it by the introduction of badminton, or lawn tennis, another form of battledore and shuttlecock, played over a piece of netting, but the attempt ignominiously failed, and the hoops and mallets are once more familiar adjuncts of every county and town house. I myself am not at all an ardent admirer of the game. As an excuse for flirtation it answers but indifferently well, as, though it may show off a neat foot and ane to advantage, Adonis and Venus are in the centre of a ring of chaperons and spectators, and during the present prevalence of actions for breach of promise, it is very injudicious to show a young lady how to go through a hoop in the presence of witnesses. It is rather an excuse for cheap entertainment. You can ask forty people to come and play croquet and all you require is a large lawn, some strongish coffee, and a few pounds of strawberry ice. At three o'clock the company assemble, and at five o'clock they go or think about going, and they will all swear they have enjoyed their afternoon as much as if you had given them turtle soup, a haunch of venison and 1820 port. The most proficient country players are the high church parsons who come out in long black coats and white ties, constituting what I believe the French call the third sex. But very different

from rural kettledrums and teafights are the croquet tournaments at Wimbledon. Here the ground is smoothed and bevelled till the turf is like a billiard cloth, and the hoops are almost as small as the balls. The players have their own terms, and talk about giving "bisques," and other technicalities unintelligible to the ear of the uninitiated. They have made their play quite a science, and it is as difficult every bit to make certain strokes as to be certain of a kiss cannon or to take W. G. Grace's balls off. The champion player of England is Mr. Walsh, the editor of the best sporting paper, "The Field," and I have heard that one of his greatest opponents is no one else but that radical Baronet, who is trying to upset "our Vendôme Column," namely Sir. Charles Dilke, M. P. IDSTONE, JUNIOR.

THE OSWEGO PIGEON SHOOT.

We append herewith the scores of the pigeon shooting matches that took place at the late State Convention, which may prove serviceable to many of our readers for reference.

Fifth day—shooting at double birds:

SCORE.			
Eighteen yards—10 double rises each.			
Name.	Killed.	Name.	Killed.
Barnum.....	18	Roberts.....	15
Witmer.....	15	Shimer.....	14
Nichols.....	14	Pitz.....	12
Jones.....	13	Stein.....	14
Babcock.....	13	Garrison.....	3

Fisher.....	14	Hambleton.....	19
Brown.....	15	G. Smith.....	19
Lamberton.....	18	Weiss.....	14
Seymour.....	10	Newell.....	18
Murray.....	14	Truman.....	17
Stevenson.....	17	Babcock.....	16
Ely.....	16	Lansing.....	16
Nutting.....	15	Gale.....	13
Higham.....	12	Green Smith.....	13
Walzer.....	14	Gerber.....	16
P. Tompkins.....	18	H. Smith.....	14
Hudson.....	11		

E. B. Hambleton and Geo. Smith, both of the Forester Club, of Buffalo, had killed nineteen birds each and as they concluded not to shoot off the tie, the first prize, one of Remington's best breech-loaders, was awarded to them jointly to dispose of as they might think proper.

Ties of 18—21 yards, 5 double rises.

Brown.....	5	Couch.....	5
Walzer.....	1	Newell.....	8

The second prize, the *Turf, Field and Farm* cup, was awarded to R. Newell, of the Forester Club, of Buffalo.

Ties of 17—21 yards, 5 double birds.

Barnum.....	4	Kimber.....	4
Murray.....	2	Truman.....	9
Kennedy ruled out.....			

The third prize, a case (24 pounds) of Oriental Falcon ducking powder, was awarded to F. Truman of the Iliion Sportsmen's Club.

Ties of 16—21 yards, 5 double birds.

Hinsdale.....	5	Babcock.....	5
Abbey, ruled out.....		Lansing.....	8
Stevenson.....	0	Gerber, Jr.....	0

The fourth prize, Parker's belt, was awarded to W. S. Lansing, of the Forester Club, of Buffalo.

Immediately after the conclusion of the double bird shoot, the single trap shoot was commenced; 59 entries; E. Garrison and S. T. Johnson, judges, S. H. Turrill, referee.

SCORE.			
Long.....	8	Lusk.....	1
Hoag.....	10	Waterman.....	8
Barnum.....	8	Estes.....	7
Porter.....	5	Hudson.....	10

SIXTH AND LAST DAY—SATURDAY.

Shooting of ties on the match of the previous day.

Ties of 10—26 yards.

Hoag.....	0	Wright.....	0
Hambleton.....	1	Lusk.....	1
Stevenson.....	3	Hudson.....	5
Higham.....	4	Newell.....	4

Ed. Hudson, of the Central City Club, of Syracuse, first prize, Parker Bro.'s breech loader.

Ties of 9—26 yards.

Lawrence.....	0	Morse.....	0
Lucas.....	5	Green Smith.....	1
Loder.....	3	McKinley.....	1
Bex.....	0	Harmon.....	0
George Smith.....	2	Hoyt.....	5
Murray.....	2		

The second prize, the FOREST AND STREAM vase, was awarded to R. B. Harmon, of Central City Club, of Syracuse.

Ties of 8—26 yards.

Long.....	Withdrew	Witmer.....	0
Burroughs.....	0	Hinsdale.....	0
Trowbridge.....	2	Dorr.....	2
Tompkins.....	5	Waterman.....	0
Page.....	1	Truman.....	0
Barnum.....	0	Allen.....	3
Crouch.....	1		

The third prize, a pocket rifle, was awarded to P. Tompkins, of the Dean Richmond Club, of Batavia.

Ties of 7—26 yards.

Laverack.....	0	Fulton.....	1
Walzer.....	1	Morse.....	0
Flewer.....	3	Nichols.....	0
Estes.....	4	Poncher.....	1
Hooker.....	0	Lansing.....	5
Lamberton.....	4	Lockwood.....	0
Burroughs.....	2	Nutting.....	0
Sargent.....	1	Hiram Smith.....	0

The fourth prize, a silver mounted revolver, was awarded to W. S. Lansing of the Forester Club, of Buffalo.

THE DEAN RICHMOND CUP.

The single trap shoot was concluded at 11 o'clock, and the contest for the grand State prize, the Dean Richmond Cup, open to all organized clubs of this State, members of the State Association, was in order. The cup to be the property of the club winning it three times.

We give below the names of clubs and the representatives from them, with the official score.

OFFICIAL SCORE.			
Forester Club, Buffalo.			
R. Newell.....	16	George Smith.....	18
F. B. Hambleton.....	16		50
Central City Club, Syracuse.			
E. Hudson.....	16	H. Watkeys.....	14
R. B. Harmon.....	17		47
Dean Richmond Club, Batavia.			
P. Tompkins.....	19	F. R. Lusk.....	11
O. J. Waterman.....	10		46
Niagara Falls Shooting Club.			
S. T. Murray.....	12	B. O. Fulton.....	14
J. M. Whitmer.....	17		43
Monroe County Club, Rochester.			
H. G. Lucas.....	14	Hiram Smith.....	11
J. H. Brown.....	16		41
Audubon Club, Rochester.			
A. B. Lamberton.....	14	C. C. Morse.....	13
W. J. Babcock.....	11		38

The Foresters won the cup. This being the second time, they have only to win it next year to retain it.

Sea and River Fishing.

FISH IN SEASON IN JULY.

Salmon, <i>Salmo Salar</i> .	Salmon trout, <i>Salmo confluis</i> .
Trout, <i>Salmo trutta</i> .	Michigan Grayling, <i>Thymallus tricolor</i> .
Land-locked Salmon, <i>Salmo gairdneri</i> .	<i>micropterus nigricans</i> .
Black Bass, <i>Micropterus salmoides</i> .	Sea trout, <i>Salmo immutatus</i> .
Striped Bass, <i>Morone saxatilis</i> .	Weakfish.
Bluefish, <i>temnodon saltator</i> .	

—It rarely happens that salmon retail in the market at twenty cents, but this is about the price to-day of the bulk of the fish coming from the Miramichi River. Maine salmon are scarce in New York. It is not to be supposed from the fact that we do not see them on the slabs in Fulton Market that they are not caught. Boston takes all that is offered, and pays from thirty to thirty-five cents for them. Just now the heavy demand for the Saratoga hotels commences. The Grand Union's fish consumption is about 200 pounds of salmon per diem; multiply this by six or seven and you get some 1,400 pounds of salmon to be eaten up per diem at Saratoga alone, not counting the trout, bass and fresh mackerel. Spanish mackerel coming in nearer home. Some fine fellows were caught early this week off Long Island and New Jersey and brought seventy-five cents a pound. The bulk still coming from the south and selling at thirty-five cents. Pompanoes in good supply from North Carolina and down to forty cents. The epicures now are not alone in the market for this delicate fish; the first class restaurant keepers now add them to their bills of fare. Bass coming in plenty from Rhode Island. On Monday last some 3,000 pounds arrived in one fishing smack, averaging thirty pounds, worth fifteen cents for big ones and eighteen cents for the smaller ones. Sheep's heads rather scarce, the rush being over; worth twenty cents. Blue fish in quantity, coming from everywhere from the Delaware coasts, away up to Cape Cod; worth eight cents. Halibut from the Georges plentiful, and selling at fifteen cents. There never was such a mass of turtle on the market. The big city is not alone the exclusive green turtle soup maker and consumer. Country town restaurateurs purchase turtle, and rural populations glory in him. Absent or scarce are the soft crabs just now, but they are off and on, (we mean the crabs and their shells,) and we may have them again in plenty, as the soft crab harvest lasts until October. Good handsome lobsters are arriving from the Jersey coast. Fishermen are now making a business of catching them, and perhaps 800 pounds a day are coming in. Now if Jersey men will only be careful to let the little ones alone, it may become a good business. Fish dealers, restaurant keepers and canners ought to refuse all small lobsters, so as to preserve the species.

—A good fishing ground for black fish at Barnegat is near the boiler of the wreck Idaho.

—A Rhode Island correspondent speaks of having taken a fifty-eight pound bass last week, but does not tell where.

—The Fall River *News* is responsible for whatever there is fishy about the following story:—One day last week the fishing tug A. W. Hathaway, Captain Nickerson, belonging to Joseph Curch & Co., of Little Compton, pursued up about 3,000 barrels of menhaden, and when they supposed they had them secure, the fish in a mass started off shore, towing the steamer after them some ten miles, when the fishermen cut the seine clear and let them go. It is a good story for warm weather.

—By buying a ticket to Tuckerton Southern Railroad of Jersey, and going to Capt. Bond's Long Beach House, the best sheephead fishing can be enjoyed. They have been averaging twelve pounds apiece.

Canarsie Bay at present is bare of fish, and an attempt off Sandy Hook last Monday to take blue fish resulted in total failure.

—Our Shrewsbury correspondent, "Check Cord," writes

us a doleful letter deploring the great waste of weak fish, bass and other valuable food fish on Raritan Bay and river, where they are caught by cart loads and used by the farmers for manure. If there is no other law to prevent or punish this prodigality, we surmise that those who spread these fish upon their land might be indicted for an intolerable nuisance. Surely, fish ought to be cheap in the markets of New York City, with such abundance at its doors, and prices could be kept at such a figure as to make it more remunerative to fishermen to bring them to market than to sell them for manure, and still not be burdensome to the poor.

—Our correspondent M. M. B., who has recently visited Cape May and Atlantic City, reports the season late, with but few visitors at the hotels. Blue fish were abundant.

—Ashland House, Atlantic City, N. J., by Rodgers & Wilkins, is open for the season.

—Last week Mr. B. F. Howard, of Wareham, Mass., caught seventy-six striped bass with hook and line, above the bridge and within five hundred yards of the railroad depot at Wareham, in about two hours. Other parties were equally successful.

—Buzzard's Bay and its estuaries continue to furnish an abundance of sport to its visitors. We are continually in receipt of good reports from that vicinity. Blue fish, striped and rock bass, tortog, scup and squeteague are its inhabitants.

—D. L. D., of St. Louis, who is a member of the Murdock Lake Fishing Club, informs us that club is still in a flourishing condition, though its membership is limited to a small number. Another club recently formed has a club house and resident superintendent at King's Lake. D. L. D. has just returned from a short excursion to the lakes around Oconomowoc, Wisconsin, where he captured some splendid bass and pickerel. He says:—"I know of no point so convenient in this section of country where one can go and enjoy a few days' fishing with such prospects of success as Oconomowoc, about thirty miles north-west of Milwaukee."

—Trout fishing exceptionally good in Northern New Hampshire at present.

—There is a law now on its passage through the New Hampshire Legislature which protects black bass during the months of May and June. This restriction ought to pass, and apply to other States as well.

—Corbin's Union Hotel at Canaan, Connecticut, affords first rate accommodations at very reasonable rates; is the centre of a large sporting region, and can be reached by the New Haven & Housatonic roads at 8 A. M. and 3 P. M. from Grand Central, (for \$3.00) or by Harlem & Conn. Western railroad, at 9.30 A. M. or 3 (?) P. M., fare the same. Boats, baits and tackle to be had at Twin Lakes.

—Our correspondent S. C. Clarke, whose winter sketches of Florida so frequently entertained our readers, is booked for the Nepigon. No less than twenty subscribers of FOREST AND STREAM will visit that grand fishing ground this season, and we have respectfully solicited for them every attention from the Hudson Bay Company's agent at Red Rock, Robert Crawford, Esq.

—A friend who visited the fish stall of F. H. Johnson, Fanueil Hall Market, Boston, last Friday, found a 33lb. salmon from the St. Lawrence River, near Quebec. Canadian salmon are running unusually large this year.

—John Wilkinson, of Chicago, with a party of three, started for the Nepigon River, July 8th.

—We tender our thanks to Messrs. Thomas & Co., proprietors of the Manitou House, at Manitou, Colorado, for courtesies and invitation extended. Manitou is in one of the best trout fishing centres of the Rocky Mountain region, and the season extends through July and August.

—One of the best trout regions within striking distance of New York lies on the borders of Sullivan and Ulster counties, and includes the famous Beaverkill and the Willemoc rivers. Frank Forester years ago sang the praises of the Willemoc, and although its trout are not so abundant now as then, they are nevertheless numerous and often large, thanks to the efforts of a number of Poughkeepsie gentlemen to protect the river. At the head of the Willemoc is the beautiful lake of that name, set in a basin formed by hills, on the borders of which stand the snug quarters of the Willemoc Club, composed of the gentlemen named. From this lake to where the river flows into the Delaware the distance is about fourteen miles, and the lower six miles of stream is free to all, and affords really excellent fishing. The bed of the river is broken into rapids and pools, the water is clear as crystal, and the width of stream ample for comfortable fly-casting. By taking the 6 o'clock morning train of the Oswego Midland Railroad the angler can reach Morrston at noon, distance one hundred and seventeen miles, enjoy the afternoon fishing, and fish all the next day until 3½ o'clock, when the train will bear him back to this city and land him at Courtland or Desbrosses street at 10½ o'clock with his fish fresh and ready for the morning breakfast. We give this information for the especial benefit of gentlemen who have no opportunity for long vacations. Mr. Davis keeps a snug hostelry at Morrston, and will show the readers of FOREST AND STREAM every attention, at most moderate charges—\$1.50 per day we believe. Railroad fares say \$3.50 each way.

Eight miles from Morrston by wagon road is Murdock's celebrated summer boarding house on the Beaverkill. His guests are afforded every facility for trout fishing.

CAMP KENNEBAGO, June 29th, 1874.

EDITOR FOREST AND STREAM:—

Nothing of great interest has happened the past week at the "head-quarters of the Oquossoc Angling Association," and only four arrivals—Mr. W. D. Lockwood, Providence, R. I.; Dr. C. R. Agnew and Dr. F. N. Otis and son, New York City. The fishing is growing better every day, but about two weeks behind that of last June; but the trout in the streams about camp run smaller than ever before. A member of the club who has been here three weeks has just departed, taking home with him, packed in ice, over a hundred pounds of trout, and has caught while here 175 trout, which weighed 231 pounds, and among the lot one eight pounder*. Mr. George P. Rowell and Mr. John A. Moore of New York, passed through here on Thursday, having entered this region at Dixfield Notch and passed up through the entire chain of lakes. They speak of the trip as delightful, and no difficulty in making the carries from Lake Umbagog to Rangely Lake, provided you go light. The "log drivers" are willing to assist at every dam, and the journey is one of variety and novel experiences. This camp is 1,511 feet above the level of the sea and the air is consequently pure and delightful. Most of the flies used here are of gay colors, but the "cast" mentioned in my last letter has been the most successful. The great preventative to the usual good fishing in this locality has been the high state of the water, which could not be remedied until the logs had passed the upper dam. The logs are now through, and the water is going down very fast. It has also been very cold. One morning last week, at 5 A. M., the thermometer indicated 33 deg. The Rangely stream has been fished very close this past week, eighteen rods being on the stream at one time, and the stream is only two miles long! But it is now experiencing a little rest and will be better before long.

JOE.

*Our attention was called to this noble specimen of trout after its arrival at New York. It was caught by R. G. Allerton, Esq. in Mooseluckmaguntic Lake, June 25th, and exhibited at the restaurant of Mr. George Marthaler, 16 Dey street.

CAMP KENNEBAGO, RANGELEY, Maine, June 30, 1874.

EDITOR FOREST AND STREAM:—

The high state of the water, which has delayed our sport for the past two weeks, is still on the decrease, and the best fishing to be had this season at the camp is now at hand. A few fine trout have been taken on the Kennebago Rapids, and one of the guides took off our dock in sight of the camp, two trout weighing each 1½ and 2½ pounds, and in view of that fact, it was a standing joke that there was no necessity of leaving camp when fish of that size were just at hand.

A party also visited the Capsuptuc Falls on Friday last and caught about three dozen trout averaging three-quarters of a pound each. The only place on the Falls where the fish were taken was just above the "Jam" and at the landing two hundred feet below. Here the sport was quite lively, and three times a "tandem team" was driven, and six times a span.

The large trout, over three pounds, have all been taken while trolling with minnows, but under that weight many have been landed with flies, mostly with bright colored flies, with plenty of reds and yellow in their composition. The last fishing on the Mooseluckmaguntic Lake has been off Sandy Point and Bugle Cove. Mr. George Dawson's six-pounder was caught off the former and R. G. Allerton's eight-pounder off the latter place. One of the club, while at the "Upper Dam" the past week, left his tooth brush. Some days afterwards he recovered it, and the question arising as to its having been used in the mean time, he settled all differences of opinion by immediately marking it "Oquossoc Angling Association, *Pro Bono Publico*," attaching a string to it and suspending it in our wash room, where it now remains.

Casual visitors to the "Rangeley Region" cannot of course enjoy the accommodations of the "Oquossoc Angling Association" without the company or permit from one of the stockholders, but there is plenty of good fishing in that vicinity.

The following are the rates, distances, hotels, &c., from New York to "Kimball's," which is at the head of Rangeley Lake. Leaving New York Monday morning on the first train you reach Boston at 5:40 P. M., fare \$6. Tuesday morning take the 8:15 train from the eastern depot and you can check all baggage to Farmington, Maine, as well as purchase tickets, fare \$5.50; cars change at Portland, with thirty minutes for dinner. You reach Farmington at six P. M., and after supper at the Forest Hotel, which is the best house, you take the stage, which is driven by the agreeable story-telling "John" to Phillips, a distance of eighteen miles, fare \$1.50, which place you reach at 11 P. M. Stop at the "Larden House," and Wednesday morning take the stage to "Kimball's," head of Rangeley Lake, distance eighteen miles and fare \$1.50. This ride alone is worth going to Maine to enjoy, and passes through a lovely section of country, one bill of which, (Beach Hill,) is 3,000 feet above the level of the sea, from which fine views of Saddleback, Abraham and other mountains can be obtained.

You reach "Kimball's" at 1 P. M., where you can find good accommodation, or you can go on to the "city," (as they call the village of Rangeley,) from either of which points excursions can be made to the lake and brooks in the vicinity. I also omitted to say good fishing could be had at Phillips, but as larger trout can be had at Rangeley Lake and vicinity, people generally push on. Board can be had for about \$10 a week almost anywhere. A pleasant trip home is made by passing down Rangeley Lake and through Rangeley Stream, on the latter of which is "Camp Kennebago," headquarters of the "Oquossoc Angling Association," thence across the Mooseluckmaguntic Lake, twelve miles to the "Upper Dam," and then through the other three lakes, ending with Lake Umbagog and entering New Hampshire at Dixfield Notch.

Before I close allow me to pay a compliment to the shoe packs and moccasin boots manufactured by Frank Good, of Manchester, N. H., whose advertisement I notice in your valuable paper. No such ease and comfort can be given to a sportsman's feet as that obtained by their wear; a number are in use at camp.

JOE.

ANGLING IN NOVA SCOTIA.

NEW YORK, June 30th, 1874.

EDITOR FOREST AND STREAM:—

I have been very much interested reading "D.'s" account of "Trout-ing in Nova Scotia," published in FOREST AND STREAM of June 11th, as it was my good fortune to pass my happy days of childhood in Yarmouth and Chebogue, a small town three miles from Yarmouth on the road to Tuskent. I can assure your readers that the account was not in the least exaggerated; it has often been a wonder to me how such a paradise for sportsmen could remain so long unknown. The great trouble seems to be that parties have an idea that a trip to Nova Scotia is about the same

as a trip to England, whereas it occupies no more time and costs no more—if as much—than a trip to the Adirondacks. You can leave New York at 8 o'clock Monday night, leave Boston on Tuesday at 12 o'clock per steamer Linda, and reach Yarmouth at about 6 o'clock on Wednesday afternoon, the whole trip costing about thirteen dollars. Can you not induce some energetic, go-ahead man to go on there and start a sportsmen's hotel, similar to those they have in the Adirondacks? I believe there is a fortune in it if conducted right. Let the place once become known, and my word for it it would be crowded. I should go into it myself but unfortunately have not the necessary capital; however, I don't wish to be "a dog in the manger," and if any of your readers have an idea of trying it you are at perfect liberty to give them my name and address, and I will cheerfully give them all the information in my possession.

For fresh or salt water fishing, or game of any kind there is no place on this hemisphere superior to Nova Scotia.

I hear from my friends there that for the last two years they have been catching pollock in the harbor of Yarmouth with a fly. I don't know what the American name for pollock is; as near as I can remember it is a very similar fish to our bluefish.

LUKE TRIPP.

Yachting and Boating.

All communications from Secretaries and friends should be mailed no later than Monday in each week.

HIGH WATER, FOR THE WEEK.

July 12.....	10 57	7 40	6 57
July 13.....	11 46	8 30	7 46
July 14.....	morn.	9 20	8 33
July 15.....	0 33	10 3	9 17

—In the Jersey City Yacht Club sixteenth annual regatta sailed on Tuesday, June 30th, twenty-five miles course for 2d class; (no 1st class vessels competing), Incognita, of Keyport, Capt. Ricker, took first prize; 3d class boats, eighteen miles, Irene; and 4th class boats, same course, Jennie winner.

—The Third Annual Regatta of the Seawanhaka Yacht Club sailed July 4th at Oyster Bay may fairly be called one of the finest ever witnessed in American waters. There was a magnificent southeasterly wind, and some of the fastest yachts were among the entries. The steamboat D. R. Martin arrived with her quota of spectators from Laurelton and other places along the shore, at 9 o'clock. The judges, Messrs. F. G. Foster, W. Krebs, J. H. Elliott, M. R. Schuyler, and E. M. Townsend boarded and began to arrange for the race. It was found that there were present the Avinel, Feiseen, Mirth, Undine, and Uncle John, of the second class, and the Alcione, Cettie, Jeta, May, and Mary Emma, of the third class. At 10:42 A. M. the first signal was made to get ready, and at 10:45 another "to go" was given, and up went the boats' jibs, and away they sped with a free wind to the Middle Ground Buoy and stake-boat, which they passed in the following order: Mirth, Mary Emma, Undine, Uncle John, Feiseen, Alcione, Avinal, Jeta, Ettie, May. Having turned this, they hauled their wind and stood for the stake boat off Hog Island Buoy, keeping it on the starboard hand, thence to and around a stake-boat off Lloyd's Neck Buoy, thence to and around a stake-boat off Red Buoy No. 2 on the Middle Ground, and back again over the same course to the stake-boats on the Middle Ground, finishing at stake-boat off Steamboat Creek. Cruising about in Cold Spring Harbor, to keep out of the way, were found the boats of the first-class, eight in all, four schooners and four sloops—Idler, Ariel, Triton, Peerless, Vindex, Addie, Alert, and Glance. The course for the first-class yachts in this race differed from that of the previous day. Starting from the Middle Ground Buoy, thence to Centre Island buoy, then the Corinthian course, omitting Matinicoek, and finishing at the Middle Ground buoy.

The judges only waited sufficiently long to see the little ones clear, then blew the preparatory signal, followed ten minutes later by a whistle to go. The breeze had been steadily increasing, and at the time of the start was stiff from the southward, and the yachts crossed under a cloud of sail, and going very fast through the water, headed for Centre Island buoy. The start was a flying one and timed as follows:

	H.	M.	S.		H.	M.	S.
Idler.....	11	58	50	Vindex.....	12	5	5
Addie.....	12	1	44	Peerless.....	12	6	8
Ariel.....	12	4	5	Glance.....	12	7	9
Triton.....	12	4	0	Alert.....	12	7	9

To the first stake-boat the run was short, but soon in that distance the Triton passed the Addie and Ariel, and rounded next after the Idler. The times of rounding this buoy were as under:

	H.	M.	S.		H.	M.	S.
Idler.....	12	15	5	Peerless.....	12	21	18
Triton.....	12	19	20	Ariel.....	12	21	30
Addie.....	12	19	50	Alert.....	12	24	8
Vindex.....	12	21	5	Glance.....	12	24	58

As they all hauled up for Eaton's Neck, the full force of the wind became perceptible, and as the yachts heeled until their rails were under, and threw the white foam from their bows, it was a most magnificent sight. The Idler still held her lead, and was apparently increasing it. She carried her sail, too, wonderfully well, and stuck to the large club maintop sail with which she had started. The Triton, although compelled to take in her jib topsail, and fore gaff topsail, seemed to go none the slower for it, and rushed through the water with enormous speed. Following her came the Peerless, and in the wake of that schooner was the Vindex, who had already passed the Addie, and was carrying her sail and going through the water in the most magnificent manner. The time of rounding the stake boat at Eaton's Neck was as follows:

	H.	M.	S.		H.	M.	S.
Idler.....	12	57	6	Vindex.....	1	8	39
Triton.....	1	4	56	Addie.....	1	9	20
Peerless.....	1	6	26	Ariel.....	1	14	4

The rest were not timed, as the steamer had to hurry to Shippan Point to time the leaders. The run across was not interesting, nor was the starting position of the yachts much changed:

	H.	M.	S.		H.	M.	S.
Idler.....	1	31	10	Addie.....	1	50	16
Triton.....	1	39	55	Ariel.....	1	57	41
Peerless.....	1	44	28	Alert.....	2	05	42
Vindex.....	1	47	13	Glance.....	1	10	53

From here to home stake-boat was a dead beat, and all the yachts wore around the buoy, and went off on the star-boat tack but the Commodore, who stood by with his port

tacks on board to break tacks with the fleet, and have a try at luck. Beating across, the superiority of the Vindex was again shown, and she continued to increase her lead on the Addie:

	Start.	Finish.	Time.
Yacht.	H. M. S.	H. M. S.	H. M. S.
Idler.....	11 58 50	2 44 32	2 45 42
Triton.....	12 04 10	2 54 47	2 11 57
Peerless.....	12 06 08	3 05 40	2 59 41
Ariel.....	12 04 05	3 30 06	3 29 00
FIRST CLASS SLOOPS.			
Vindex.....	12 05 05	3 01 44	2 56 29
Addie.....	12 01 44	3 09 41	3 07 57
Alert.....	12 07 09	3 27 47	3 20 36
Glance.....	12 07 09	Not timed.	

The Triton wins the first prize by about two minutes. The Vindex is the winner of the first-class sloops, without doubt, and her speed in the smooth water was wonderful. The race of the smaller boats was well contested to the end. The Feiseen is the winner of the second-class sloops, her time of the race being 4h. 22m. 55s., and the Mary Emma of the third-class sloops, she making the race in 4h. 31m. 42s.

The sailing regulations of this club compel the owners of all yachts, large or small, to steer their vessels in a race, so that all their regattas are Corinthian to a certain extent.

The winner in the second-class, the Feiseen, sailed upon this occasion with an entirely Corinthian crew, as did several other yachts.

—The Corinthian Race for sloops, at Oyster Bay, sailed July 3d, was a great success in every way, and we may say that Corinthian yachting has been fairly introduced in this country, for we do not anticipate any more trouble in the handling of the large schooners at Newport than is required in the management of such sloops as were entered for the race of the 3d.

Early in the forenoon of Friday, the seven contestants for Corinthian honors, together with the schooners "Idler" and "Ariel," got under way and proceeded to work down from Oyster Bay Harbor to Centre Island buoy, the place for the start. The wind was light, and from every possible direction, and a long time was occupied by the fleet in getting to the more open water selected for the course, which was starting from Centre Island buoy to and around stake-boat at Eaton's Neck, thence to and around stake-boat off Shippan Point; from there to stake boat anchored off Matinicoek Point, and from there to place of starting, crossing an imaginary line drawn between Centre Island stake boat and the Commodore's yacht "Ariel."

The starting yachts and crews were as follows:

VISION—J. J. Alexandre, owner and captain. Henry Alexandre, Frederick Tams, L. Hoppock, Charles Gimbernat, P. Gimbernat, C. W. Betts, John Duer, Henry Remsen, and J. Foster.

VINDEX—Robert Centre, owner and captain; H. Carry Smith, Henry Steers, William Krebs, W. S. Wood, D. B. Kendall, Mr. Blanchard, Gouverneur Morris, Jr., M. Roosevelt Schuyler, Mr. Roosevelt, Mr. Jackson and Mr. Trotter.

QUI VIVE—Thomas Chapman, owner and captain; W. Bryant Godwin, Edward B. Mott, Wallace Mott, A. W. Wardell, J. D. Acker, H. W. Eastmond, W. I. Taber, William Abbiecrombie, and Peter Bogart.

HELENA—F. W. Flint, owner and captain; E. E. Towle, J. E. Walsh, H. L. Phalon, Thomas Donaldson, Charles Prior, and James Brown.

IDA—David Crocker, owner and captain; B. W. Vail, Stanley Creacen, M. Goldsmith, Arthur Weeks and Fred Weeks.

KAISER WILHELM—W. E. Greenleaf, owner and captain; J. V. S. Oddie, J. W. Thorn, Jr.; N. C. Thorn; T. Bartow, N. Edgar, and O. B. Smith.

ADDIE—H. L. Roosevelt, owner and captain; Cornelius Roosevelt, Bayard Foulke, William Foulke, J. W. Beekman, Jr., Fred De P. Foster, and John Roosevelt.

When the Ariel reached the starting point it was two o'clock in the afternoon, so much time had been lost beating down the harbor in the light wind, that it was determined to make a start, and at sixteen minutes past three the preparatory gun from the Ariel was fired, and ten minutes later the gun to start. The yachts meantime had been dodging about or lying hove to, keeping in the best position for crossing at the signal. And as the report of the gun was heard, up went jib topsails and helms, and the yachts bore down for the line which they crossed at the following times:

	H.	M.	S.		H.	M.	S.
Kaiser Wilhelm.....	3	27	13	Ida.....	5	32	42
Alert.....	3	27	19	Addie.....	3	32	50
Qui Vive.....	3	27	32	Vision.....	3	33	01
Helena.....	3	29	40	Vindex.....	3	33	17

It was a most beautiful start, and as the wind had increased to a light, though steady breeze from the west northwest, the yachts went flying off with their sheets well started and all their light sails. The Vindex displayed marvelous speed for such a light wind, and on the way to Eaton's Neck the first turning point picked up and passed the entire fleet, winding ahead. The Ida on the same run found her topsail was too much for her topmast which unfortunately went over to leeward. The Kaiser was handled beautifully, as indeed they all were, and after passing stake boat at Eaton's Neck, flattened aft her sheets and stood on across the Sound on the port tack. The Vindex wore around the stake boat and trimmed aft on the starboard tack under the impression that she could lee bow the tide. The Vision followed the Vindex at first but afterward concluded she would see what she could do on the other tack. And the Addie by this time was well across, looking for a breeze from the Connecticut shore.

The Idler, after taking the time at Eaton's Neck, laid her course for Matinicoek, and the Ariel, which after the start had crossed to Shippan Point was now found ready to time the racers as they rounded. Soon the wisdom of short tacks along the Connecticut shore became apparent, for the little Kaiser was able to round ahead of the fleet. It was a beautiful sight to see each yacht as she rounded and bore away for Matinicoek, loose and set her balloon sails, and although the day was unfortunately a light one, the amateur sailors must have had a little "sailorizing," setting, shifting, and taking in their large balloon jib topsails. The run across to Matinicoek, with everything set, did not take long, and that stake-boat was rounded as follows:

	H.	M.	S.		H.	M.	S.
Vision.....	7	01	30	Kaiser Wilhelm.....	7	09	20
Addie.....	7	07	30	Vindex.....	7	11	35

From here to the home stake-boat the wind was free again, the Vision still far ahead; the Vindex overhauled and passed the Kaiser, and rapidly gained on the Addie. The line was crossed as follows:

Yacht.	Start.	Finish.	Elapsed Time.
H. M. S.	H. M. S.	H. M. S.	H. M. S.
Vision.....	3 33 07	7 35 10	4 02 03
Addie.....	3 32 50	7 45 22	4 12 30
Vindex.....	3 33 19	7 46 28	4 13 09
Kaiser Wilhelm.....	3 27 13	7 49 44	4 22 31
Alert.....	3 27 19	Not timed.	
Qui Vive.....	3 27 32	Not timed.	
Helena.....	3 29 40	Not timed.	
Ida.....	3 32 40	Not timed.	

Thus the Vision wins the race, with the Vindex a good second on the allowance of time.

CITY OF BOSTON SAILING REGATTA.—The sailing regatta in Boston Harbor, under the auspices of the city, July 4th, was a perfect success, being the largest ever there held, there being entered twelve first class, thirty-four second class, and sixty-four third class, making in all one hundred and ten yachts, besides sixteen fishing boats in the special race. A fresh southeast wind gave the contestants plenty of motive power. We are obliged to omit the details of the race, and give the return time of those yachts only whose time was taken:—

FIRST RACE.
Distance, 23 miles. Start made at 2 P. M.
FIRST CLASS SLOOP.

Special Race—Distance, 13 miles; start made at 2:45 P. M.

In this class for fishing boats there were sixteen entries, all of which went by numbers and not by names. The judges have awarded the first prize, \$100, in the first race for sloops to the Coming, and the second prize, \$50, to the Nina. For schooners, first prize, \$200, to the Fearless, second prize, \$100, to the Azalia. In the second race for centre-board sloops the first prize, \$90, was awarded to White Cap, and the second prize, \$50, to Clytie. For keel sloops, in the second race, the first prize, \$90, to sloop Mist, and the second, \$50, to sloop Starlight. In the same race for schooners, first prize, \$90, to Vanitas, second prize, \$50, to Ennie. In the third race for centre-board boats the first prize, \$70, to Fannie; second prize, \$35, to Ripple; third prize, \$25, to Mabel. For keel boats in the third race the decision is reserved. In the special race for fishermen's boats the Saint John took the first prize, \$50; second prize, \$25, to Primrose.

BOSTON, July 2, 1874.

EDITOR FOREST AND STREAM:—

The annual regatta of the Eastern Yacht Club took place yesterday at Swampscott. The entries were as follows:—

FIRST CLASS SCHOONERS.

Name.	Commander.	Length on Water Line.
Azalia.....	Commodore Forbes.....	63 50
Brenda.....	J. G. Little.....	61 02
Foam.....	T. D. Boardman.....	76 50
Halcyon.....	Vice-Com. Jeffries.....	79 35
Rebecca.....	J. H. Reed.....	66 75

SECOND CLASS SCHOONERS.

Edith.....	G. O. Hovey.....	56 75
Fearless.....	E. B. Phillips.....	51 15
Latona.....	J. G. Cushing.....	55 05
Romance.....	C. W. Armory.....	55 06

FIRST CLASS SLOOPS.

Coming.....	Rear-Com. Tucker.....	57 —
-------------	-----------------------	------

SECOND CLASS SLOOPS.

Clytie.....	A. A. H. Meredith.....	33 56
Imogen.....	A. C. Wheelright.....	34 01
Nimbus.....	Edward Burgess.....	33 55
White Cap.....	J. M. Forbes.....	35 00

General Butler's yacht America, with the General aboard, sailed over the course with the competing yachts.

The weather was anything but favorable at the start, as it was almost a dead calm, with here and there little southerly puffs, the first boats having a little breeze, which took them well out to the eastward, while the last had barely steerage way. The fleet soon separated, the Imogen going down east in search of flukes, the leading boats going well to the eastward and then taking a short tack to the southward.

About 2:55, two hours after the start, a brisk south-east breeze set in, carrying the eastward division down to the buoy, the Imogen carrying a balloon jib and the Foam a jib topsail. At 3:10 the breeze reached the Halcyon and she started, close hauled for the buoy, which was rounded as follows, the White Cap having given up:—

Imogen.....	H. M. S.	Rebecca.....	H. M. S.
3 27 00	3 35 40	3 29 20	3 36 40
Azalia.....	3 29 20	3 38 10	3 29 20
Brenda.....	3 29 50	3 38 35	3 29 50
Coming.....	3 32 25	Not timed.	
Fearless.....	3 35 05	Not timed.	
Latona.....	3 35 05	Not timed.	

Just after the Coming had rounded, a puff carried away her topmast, and then striking the America, took off the tip of her jibboom, though it did not prevent her from carrying her jib topsail.

The America at this point, instead of keeping out of the way, cut the corner and bothered the Nimbus badly, making her luff three times.

The run down to half-way rock and thence home, was made in quick time, the boats crossing the line as follows:—

Foam, Brenda, Halcyon, Azalia, Fearless, Latona, Rebecca, Romance, Nimbus, Clytie, Edith, Imogen.

The following are the actual and corrected times:—

Yacht.	Actual time.	Correct time.
Halcyon.....	5 45 14	5 45 14
Brenda.....	5 45 39	5 34 51
Foam.....	5 46 17	5 44 29
Fearless.....	5 58 34	5 56 34
Azalia.....	5 59 11	5 48 05
Latona.....	6 01 37	6 00 25
Rebecca.....	6 03 22	6 01 52
Romance.....	6 17 02	6 16 14
Nimbus.....	6 18 07	6 17 19
Clytie.....	6 22 29	6 21 41
Edith.....	6 22 27	6 32 27
Imogen.....	Not timed.	

The America reached half-way rock after the Halcyon, but cut the corner, blanketed the Halcyon and came in second boat. It would be more gentlemanly for outsiders to keep out of the way of the racing boats.

The Azalia showed the most remarkable sailing of the fleet on the home run, as she is rigged without a jibboom or fore topmast and could only set a staysail and gaff topsail, while the other boats carried balloon jibs and other light kites.

At present the prize list stands as follows:—Brenda, \$125, first prize, with allowance; Foam, \$75, second prize, with allowance; Nimbus, \$75, first prize, with allowance; Fearless, \$125, first prize, with allowance; Halcyon, \$75, quickest time over the course, but the Halcyon protested against the Brenda for carrying more men than the rules allow, and for compelling her to keep off when she had the right of way. W. L. J.

—The National Association have settled upon Thursday and Friday, September 3d and 4th, as the days for the Troy Regatta. The races are to be four-oared shells, pair oared, double sculls and single scull.

—The yacht Silver, of the Eastern Yacht Squadron, was recently purchased at Boston by Thomas Nye, Jr., Esq., New Bedford, and has arrived at that port and been delivered to Capt. Nye. She is one of the finest yachts afloat, is schooner rigged, and registers 106.2 tons, old measurement, and 52.19 tons, new measurement. Her length is 82 feet, breadth of beam 24.3 feet, and depth 6.6, and she draws 6 feet of water with centreboard up. She will make 13 knots an hour, and last year sailed from Newport to Marblehead, a distance of 160 miles, in 13 hours. Mr. Charles V. Whitton, her former owner, and four other gentlemen, went round in the yacht from Boston. She was originally built by the famous yacht builder George Steers, but has since been rebuilt at a cost of many thousand dollars. The vessel is a great acquisition to the yacht fleet of New Bedford.

—The Schooner Yacht Lizzie Wellington, nine tons, has been purchased by Dr. S. Palmer of Fairhaven, from Capt. Samuel Curtis of Lynn.

—The Sloop Yacht Narragansett, Capt. Frank Tufts of Boston, left that port July 4th, having on board Noah Curtis, Samuel S. Sias, and John Sylvester, Esq., for a "down east" cruise. They were to meet the Portland Yacht Club at Boothbay, Me., and accompany them on their cruise, thence proceed to Mt. Desert, Penobscot Bay, &c., with the intention of being absent six or eight weeks.

—Steam yacht "Havemeyer," of New York, was at Cuttyhunk last week.

—A rowing race for four-oared shells took place at Savannah on June 22d, between the following boats:—Sappho, by the Vernon Boat Club; Lina, by Forest City Club; Lula, by Couper Boat Club; Lucille, by Forest City Club. Distance, one mile. The boats came in as follows:—Sappho, 1; Lina, 2; Lula, 3; Lucille, 4.

GALVESTON, June 27, 1874.

EDITOR FOREST AND STREAM:—

I enclose you an account of our first race. The white flag had the advantage of comparatively less current than the Jennie; blue flag; had a length start, pulled against six mile current.

Yours truly, JOSEPH LABADIE.

Race boats having only speed in view, are built as light, narrow and sharp as possible. They are rowed by from two to twelve oars, and are from fifteen to seventy feet in length, and generally not more than eight inches above water. The two-oared boats are called shell boats, scull boats or wherries; the larger ones sometimes barges.

On the 25th of September, 1873, some of the young men of Galveston, fond of aquatic amusements, met and organized what is now known as the Galveston Rowing Club.

The result is exhibited by the meeting yesterday. For the first race four-oared boats, two miles, there were three nominations, as follows:—William Boyd, Gipse and Jennie.

The men entered for the race were, by preference or selection, assigned as follows:—

Wm. Boyd—Crew: John Boyd, stroke; M. Grigg, p. s.; Ben Otway, No. 2; Wm. Bondies, bow; Frank Hitchcock, coxswain.

The Gipse—Crew: Wm. Boyd, stroke; John Crotty, p. s.; Harry Lidstone, No. 2; John Hitchcock, bow; N. D. Lidstone, coxswain.

The Jennie—Crew: E. T. Mathews, stroke; Joseph Labadie, p. s.; J. S. Smith, No. 2; Leo Nichols, bow; R. W. Shaw, coxswain.

At Kuhn's Wharf the boats were aligned for the start as follows:—Gipse on the right; Jennie next, and the Wm. Boyd on the left.

The start was made at 6:4, the Gipse leading, followed by the Jennie—the Boyd bringing up the rear. Boyd had been the favorite before the start. The following is the result:—Gipse, 24; Jennie, 25; Wm. Boyd, 25.

The second race was for single scull skiffs, the contestants being Frank Hitchcock and Alex. Nichols. At the start Nichols took the lead and made quite a favorable impression by the skilful handling of his oars; but after the first mile had been rowed, Hitchcock came in with his steady strokes, took the lead and won handsomely by two minutes, the time being—Duke, 21 minutes; Collins, 23 minutes.

The Galveston Rowing Club have recently constructed a handsome boat house off Kuhn's Wharf, which was formally baptised yesterday.

PORTLAND, Me., July 7th, 1874.

EDITOR FOREST AND STREAM:—

The Fourth of July Regatta of the Maine State Boating Association, at Portland, was not sailed, and as the city makes no appropriation for a celebration, the day was allowed to pass without the usual boat and

yacht races. The Longshore four rowed at Boston, and most of the rowing fraternity went to the Hub to see the regatta there. The yacht club started on their annual cruise to the eastward on Monday, July 6th. VERDI.

PORTLAND, ME., July 6, 1874.

EDITOR FOREST AND STREAM:—

Our "crack four," (the Longshore crew,) have again carried off the honors in the "4th of July Regatta," at the Hub, coming in easy winners in the six-mile race in forty minutes and two seconds, taking the first prize of \$350. They are "good enough to row anybody."

At the last moment a few interested parties raised a sufficient sum, by subscription, to purchase prizes for a yacht race, which came off in the afternoon of the Fourth. But little interest was manifested, only five entries being made. The corrected time is given below:—

1ST CLASS.	H. M. S.	2D CLASS.	H. M. S.
Ray, (sloop).....	1 24 35	Gracie, (sloop).....	1 30 32
Sparkle, (schooner).....	1 35 12	2D CLASS.	
Alarm, (sloop).....	1 39 18	Frolic, (sloop).....	1 32 15

The distance for first and second class was twelve miles, and for third class, ten miles. VERDI.

The Horse and the Course.

MONMOUTH PARK—THE JERSEY DERBY.—On July 4th, the handsome track and grounds of the Monmouth Park Association were inaugurated for the season of 1874, with some very brilliant racing. Praise is due the excellent methods adopted for the transportation of the immense crowd of people who left New York to witness the contests. To carry some 4,000 people is no easy task. The following were the results of the day's sport: One mile dash—Bingaman first, Galway second, Jean Valjean third; time, 1:47. Mile heats—Survivor won the first, and Artist the second and third; time 1:46, 1:47, 1:47. Jersey Derby, a dash of a mile and a half—Brigand first, Saxon second, Aaron Pennington third; time 2:44. Steeple chase of about three miles—Bullet first, Victor second, Henrietta third; time, 7:00.

For the Jersey Derby there were no less than fifty nominations, and nine horses started. The Jersey Derby is for colts and fillies of 1871. The following horses started: Saxon, Brigand, Aaron Pennington, Rutherford, The Hoaxer, Macaroon, Count Hampton, Reform, and King Amadeus, the last six horses making up the field. Coming round the last turn, the excitement was intense, Saxon ahead, leading Pennington by a neck, while Brigand was apparently doing his best, two lengths behind. It was a clever piece of horsemanship on the part of Heyward, who as they turned in the home stretch, gave Brigand his head, who now launched at the top of his speed, was a winner by fully two lengths.

The steeple chase terminated the day's sport. Five horses started—Bullet, Tammany, George West, Henrietta, and Victor. At the start Victor led, Bullet and Tammany second, West fourth, and Henrietta last; they ran in this order, taking the first jump, when Henrietta fell, threw her rider, who remounted, but was a long way in the rear. At the water jump, Victor passed Tammany, and took the lead. Going over the stone wall, George West fell, and sprawling on the field, brought Tammany to grief. Three horses being now out of the race, Victor and Bullet then went for it. Very unfortunately, Victor got hurt badly, dislocating his fetlock, so that Bullet came in a hundred yards ahead. We are glad to state that neither Gaffney nor Tully, the plucky riders of West or Tammany, were hurt, though the very fine horse Victor, we are afraid, is ruined forever. Since this was written, Tammany is dead, and Victor was so helplessly hurt that he was shot.

—Columbus, Ohio, July 1—the Summer meeting of the Columbus Driving Park Association—first race, running race, mile heats, five horses started; won by Nellie Bush; time 1:45, 1:47, 1:48. A trotting race followed; won by Granville; time, 2:35, 2:33, 2:33. A pacing race concluded the meeting—won by sleepy George; time, 2:19, 2:24, 2:34.

—Columbus, Ohio, July 3—second day's meeting—trotting race, best three in five, won by Ohio Boy; time, 2:31, 2:27, 2:30. The second race was a running one; won by War Jig; time, 1:47, 1:49, 1:48.

—At Evansville, Indiana, on July 2d, the July meeting attracted an immense audience. The race was between Goldsmith Maid and Judge Fullerton. Won by the Maid in three straight heats. Time, 2:25, 2:20, 2:21.

—At Evansville, Ind., second day's racing. First race, a trotting match, won by Jim Fisk; time, 2:42, 2:47, 2:46. Second race, won by Ella Wright; time, 2:42, 2:42, 2:37. On July 4th, the third day, four races were contested for. The first race was won by Sam Houston; time, 2:36, 2:40, 2:41, 2:40. The second, for pacing horses, won by Sucker State; time, 2:28, 2:33, 2:34. The third, won by Ella Wright, time, 2:45, 2:41, 2:37; and the last, a running race, won by Harry Todd, time 1:48.

—July 2d, at the Barrie Riding and Driving Park Association Grounds. First race, for running horses, mile heats, best two in three, won by Goldfinch; time, 1:47, 1:50. Second race, for trotting horses, five starting, won by Forest Maid; time, 2:40, 2:43, 2:42, 2:42, 2:41. Third race, a trotting one, won by Lady Star; time, 2:30, 2:33, 2:32.

—July 3d, at Barrie, Ontario, the first race was a handicap, with hurdles, 2½ miles. Three horses started; won by Mitchel in 4:55. Second running race, two mile dash, won by Moor; time, 3:49; third trotting race, best three in five, won by St. John; time, 2:37, 2:35 and 2:38. The final race of the day was a trotting race for untried horses, nine starting, Emily winning; time, 2:48.

—At Barrie, July 4th, in the trot for horses which had not beaten 2:45, there were four starters; won by Bailiff; time, 2:42, 2:44, 2:43.

—On the 6th, at the Fleetwood Course, a trot between Sorrel Jake and Brown George. Won by Jake. Time, 2:47, 2:47, 2:45, 2:52.

—At Monmouth Park, on Tuesday, there were three lively races. The first was for the Hopeful Stakes, two year-olds, half mile; seven entries, and won by Babylon. Time 51 sec. For the two mile race there were five entries. Won by Donnybrook in 4:01. The event of the day was the race for the Monmouth Cup, two and a half miles. There were four entries. Won by Tom Bowling in 4:32. Village Blacksmith fell on the home stretch, and was hopelessly disabled.

—At Chicago, July 2, the Dexter Park Races took place—mile heats for running horses, all ages. Gleaner won the first race; time, 1:48, 1:51. Second race, mile dash, won by Nelly Grenim; time, 1:48.

by SHANNON, MILLER & CRANE, No. 46
Maiden Lane, N. Y. Fair quality \$3 per set of two
pair; fancy and extra from \$4 to \$10.
P. S.—Goods sent C. O. D. everywhere.PAMRAPO—with its beautiful sheet of water
spreading before it, lovelier than the bay of
Naples: its situation commanding a view of the Nar-
rows—the gateway of the ocean—forming an ever-
changing kaleidoscope of vessels homeward and out-
ward bound. Its banks are dotted with the finest res-
idences, and nestling also under its green foliage the
bright painted houses of the several boat clubs, the
Triton's and the Bayonne's, enliven the picture. This
locality offers inducements for health to the resident
and wealth to the investor, such as no suburb near
New York can do. Only 23 minutes from New York
by the Central Railroad of New Jersey, from the foot
of Liberty street. Commutation only seven cents per
trip, monthly ticket. Lots and houses for sale. In-
quire at Forest and Stream Office, for Mr. JOSEPH
HALLOCK, for full particulars. je25lfWILBUR & HASTINGS,

WEST & LEE GAME CO., Worcester, Mass.

VIENNA, AUSTRIA, Nov. 30, 1873.

Messrs. Wm. S. Kimball & Co.:

Sirs—A friend of mine sent me, with a transport of Indian Skulls, two pounds "Vanity Fair," which I declare to be the best Tobacco I ever smoked. We have very good tobacco in Vienna—Turkish and Hungarian, but "Vanity Fair" is the King of all, by its aromatic flavor and the right sort of strength. My friend in New York got an appointment in California, by that reason I apply immediately to you, begging you to send me for the enclosed ten dollars, a supply of "Vanity Fair," and send with the next steamer to Germany. If there is a German firm that sells your excellent "Vanity Fair," I beg you to enclose me the address.

PORTABLE FOLDING BOAT,

For use as Life Boats, Lighters, Dingies, Dorys, on board of Steamers,
Yachts, and other Vessels, also for Sportsmen, Tourists, Trappers,
Exploring Expeditions, Parties Camping Out, &c.

These safe and perfectly portable boats will admit of the roughest usage. A very light,
strong and durable frame of ash or other tough wood, with canvass cover, and can be
folded in *one-eighth space*, for transportation, and carried in a light buggy wagon, on horse-
back, or by a single person, and can be unfolded ready for use, in three minutes time.
Boats neatly folded, packed and shipped by express to any address, however distant, at
the same rates of freight as ordinary goods. Address
JOHN HEGEMAN,
Ballston Spa, Saratoga Co., N. Y.

This arm was submitted in competition with over
one hundred different systems, American and Euro-
pean, to the Board of United States Officers, appointed
by Act of Congress, 6th June, 1872, for the pur-
pose of selecting the best arm for the service, and of
which Brig. Gen. A. H. Terry was President. It suc-
cessfully passed through all the tests.

The following is the report of the Board:
"Resolved, That the adoption of magazine guns for
the military service by all nations is only a question
of time; that whenever an arm shall be devised which
shall be as effective as a single breech-loader, as the
best of the existing breech-loading arms, and shall at
the same time possess a safe and easily manipulated
magazine, every consideration of public policy will re-
quire its adoption.

Resolved, further, That the experiments before the
Board with the Ward-Burton Magazine System have
so impressed the Board with the merits of this gun,
that they consider it as more nearly fulfilling the con-
ditions above specified than any other tried by them
or of which they have any knowledge, and it does
recommend that a number of magazine muskets be
made on the plan for further trial in the field." (See
Ordinance Report.)

—We are now receiving orders for these guns, and due
notice will be given in this paper when they are ready
for delivery.

The following is our scale of prices: Special Maga-
zine for large game, carrying from 3 to 8 cartridges,
70 to 85 grs. of powder, 350 to 400 grs. of lead, 8 to 10
lbs. weight, from \$60 and upwards, according to finish.
Special Long-range Magazine Rifle for Creedmoor
shooting, 90 grs. of powder, 480 grs. of lead, carrying
3 to 8 cartridges, weighing 10 lbs., from \$100 and up-
ward. Magazine guns for general use, carrying 3 to
9 cartridges, 60 grs. powder, 350 grs. lead from \$40
and upward. Single Breech-Loader, Creedmoor
shooting, for long range, 90 grs. powder; 480 grs. lead,
from \$60 and upward. Single Breech-Loader for
general use, 6 to 7 lbs., 60 grs. powder, 350 grs. lead,
from \$30 and upward. The calibre of all our rifles,
unless otherwise ordered, will be 45-100, in.
All communications should be addressed to

Accuracy, Strength & Safety

No Premature Discharges Ever Occur.

Special attention is called to their **LONG RANGE**
RIFLE, weighing 10 lbs., for target practice. This
rifle won the **AMATEUR CLUB MEDAL**, at Creed-
moor Range, New York, three times, making eighty-
one points out of a possible eighty-four—*best record*
ever made on the Range. At same Range, Fall meet-
ing, in "All Corners Match" 500 and 600 yards, 75 en-
tries and 10 prizes, the **SHARPS' RIFLES** took five
prizes with seven guns. At the Opening Meeting,
Creedmoor, June 6 1874, Sharps' took four out of six
prizes in the match for military rifles at 500 yards;
the first and second prizes being won with it by scores
of 27 out of a possible 28.

Every Rifle Warranted a good shooter;
Calibres 40, 44 and 50-100 in., of any length
desired;

Charge of powder, 50 to 100 grains;
Weight of balls, 220 to 540 grains;
Stocks, plain, also pistol grip and checked;
Sights, plain, globe and peep, Vernier with in-
terchangeable front sight and wind gauge.

Price, from \$35 00 to \$125 00.

Every variety of ammunition for above guns con-
stantly on hand. Send for circulars

IMPORTERS AND MANUFACTURERS OF

Fish Hooks and Fishing Tackle.

Would invite the attention of amateurs to their
large stock of fine goods, specially prepared for the
wants of those visiting the Long Island Clubs, the Ad-
irondacks, Lake Superior, the Maine woods, and the
Black Bass regions. A full stock of their unrivalled
Fly rods for Trout and Salmon, and the famed "Mc-
Ginnis" Black Bass Rods constantly on hand.
Nine Silver Medals and the only Gold one ever
awarded were received by them for the superiority of
their goods.

THE GREAT PRIZES,

OF THE

Fourth Gift Concert

OF THE

Kentucky Public Library

WERE DRAWN AS FOLLOWS:

The first prize of \$187,500, the capital prize, by
clubs in Memphis, Tenn.

The second gift, \$75,000, was paid to Statc Bank,
Madison, Mo., J. H. Wakefield and A. L. Sims, of
Trenton, Ky., H. H. Bollinger, Pembroke, Ky., P. W.
Dooner, Los Angeles, Cal., W. G. Byerly, Portsmouth,
O., Flint & Chamberlain, Waco, Texas, and others,
the tickets having been sold in coupons.

The Farmers' National Bank, of Richmond, Ky.,
drew the half of the third prize, \$37,500. Wm. E.
Oates, Vicksburg, Miss., J. M. Copeland, Franklin,
Ky., Armstrong & Sawyer, Gransburg, Ind., each one-
tenth. The remainder was held in clubs.

The first prize in the third drawing was all in one
ticket, and owned by L. H. Keith, Esq., Kingston,
Mass., to whom was paid \$100,000 in cash.

The Fifth Gift Concert,

which is positively the **LAST THAT WILL EVER**
BE GIVEN UNDER THIS CHARTER, will come off
in Public Library Hall, at Louisville, Ky.

FRIDAY, JULY 31, 1874.

\$2,500,000.

divided into twenty thousand gifts, will be distributed
among the ticket-holders.

W. W. GREENER'S

PATENT TREBLE WEDGE

Fast Breech Loader

Indestructible by Gunpowder.

This gun is specially designed to meet the require-
ments of American sportsmen. It will stand a larger
charge of powder, and shoot stronger than any other
system. For duck and pigeon shooting these guns
stand unrivalled. The action is simple in construc-
tion, quick and easy to load. They may be inspected
this season at all the principle gun stores in the Uni-
ted States. Prices moderate.

The second edition of "Modern Breech Loaders,
Sporting and Military," will be shortly published by
W. W. GREENER,
July 2 St. Mary's Works, Birmingham, England.

THE SALMON RUN.

O! away to the Tweed,
To the beautiful Tweed,
My much loved native stream,
Where the fish from his hold,
'Neath some cataract bold,
Starts up like a quivering gleam.

To the Tweed, then, so pure,
Where the wavelets can lure
The king of the waters to roam,
As he shoots far and free,
Thro' the boundless sea,
To the halls of his silvery home.

From his iron-bound keep,
Far down in the deep,
He holds on his sovereign sway:
Or darts like a lance,
Or the meteor's glance,
As far on his bright-winged prey.

As he roves thro' the tide,
Then his clear, glittering side
Is burnished with silver and gold,
And the sweep of his flight
Seems a rainbow of light,
As again he sinks down in his hold.

O! then hasten with speed
To the clear running Tweed,
The river of beauty and song,
Where the rod swinging high,
Throws a Coldstream dress'd fly
O'er the hold of the salmon so strong.

With a soft western breeze
That just thrills thro' the trees,
And ripples the beautiful bay,
Throw the fly for a lure—
That's a rise! strike him sure—
A clean fish, with a burst he's away.

Hark! the ravel line sweet,
From the fast whirling reel,
With a music that gladdens the ear;
And the thrill of delight,
In that glorious fight,
To the heart of the angler is dear.

Hold him tight! for the leap;
Where the waters are deep,
Give out line in the far, steady run;
Reel up quick, if he tire,
Tho' the wheel be on fire,
For in earnest to work he's begun.

Aroused up at length,
How he rolls in his strength,
And springs with a quivering bound;
Then away with a dash,
Like the lightning's flash,
Far o'er the smooth pebbly ground.

Tho' he strain on the thread,
Down the stream with his head,
That burst from the run makes him cool;
Then spring out for the land,
On the road change the hand,
And draw down for the deepening pool.

Mark the gleam of his side
As he shoots thro' the tide—
Are the dyes of the dolphin more fair?
Fatigue now begins,
For his quivering fins
On the shallows are spread in despair.

His length now we'll stretch
On the smooth, sandy beach,
With the flap from his gills waxing slow;
The sport of an hour
Spent the strength of his power,
And the fresh-water monarch lies low.

M. A. FOSTER.

For Forest and Stream.
Trip After Grouse.

BY HERBERT.

THE 31st day of July, 1873, a buggy stopped at my door, and as I stepped out to see what was wanted I was saluted with "The judge and myself leave on the ten P. M. train for Kansas; can you accompany us?" The gentleman who extended the invitation was that veteran and genial sportsman, Col. L., the popular and efficient president of the Hannibal and St. Joe Railway, which is with the travelling public one of the most popular roads west of the "father of waters." I gladly accepted the invitation, and ten P. M. found three sportsmen, with their guns and dogs, on board the western bound express. During the night our number was augmented to six, and in the morning we were called to the surface by the porter of the sleeping car, and by the time we had made our toilet our train had arrived at St. Joseph.

At the station we were met by a gentleman of the city, who was to go and locate us in a favorable place for game. We were also met by the superintendent of the St. Joe and Denver road, who generously placed a passenger coach at our disposal, with the remark that we were to have the liberty of the road, that any of the trains would haul us where we wished to go, and that the car was entirely at our service until we chose to return—an offer which we were not slow to accept. Changing cars, and taking our dogs, guns, and baggage into our special car, we moved out over the magnificent new bridge which spans the "big muddy," and joins Missouri to Kansas by an iron band. St. Joseph can well feel proud of the structure, as it was by her energy and enterprise that it was built.

We soon left the river bottoms and wound our way over the rolling prairies of northern Kansas, until a little past twelve M., when we arrived at the town of Beattie, in Marshall county. Here our car was side-tracked, and our dinner obtained at the little hotel. In the meantime Mr. H., who was our director in chief, had secured the services of teams. Dinner dispatched, guns unlimbered, the dogs given an opportunity to stretch their cramped limbs, and we were ready for business. In dividing our party reference was had to some bantering that had been carried on between different members of the party on the journey out, Col. L. and S. being pitted against Judge H. and E., the two former and E. having breech loaders, while Judge H. was still using an old favorite muzzle loader, consequently, where birds were plenty, the Colonel and S. had somewhat the advantage.

During the arrangement about starting, by some means Judge H. and E. imagined that they were not going to be placed to suit them, so they very quietly shouldered their guns and hurried away to some shooting ground which had been recommended by some of the village sports. Col. L., S., and his brother Judge S., who by the way used a muzzle loader, went in a party together, while H. and the writer, putting ourselves under the charge of Farmer Sweet, who claimed to be an old sport, and fully conversant with the abiding place of the "chicken," hurried off about three miles, where Farmer S. assured us we would find birds, and so we did, a short time before sundown. The ground was very hot and dry, and the scent did not lay well, but we succeeded in bagging over twenty fine birds, when dusk coming on we turned our faces towards town, stopping on our way at the house of Farmer S. to partake of a supper prepared by his excellent housewife. It was about nine P. M. when we had all assembled at our headquarters and counted up the results of the evening's shoot. The Judge and E. had seventeen, Col. L., S., and his brother had twenty-six, and H. and the writer twenty-four, consequently my partner and myself led the crowd. After consultation in regard to the programme for the next day, it was decided that H. and myself should return with our farmer to his house for the night, leaving the rest of the party in town to make their arrangements in the morning. About three A. M. the next morning we were routed out to an early breakfast, which was soon dispatched, and the team at the door. This time S. concluded to take his little boy along to drive and draw the birds as soon as they were killed, while he took along "Old Betsey," just to show the city chaps that when Betsey spoke a bird was doomed. We drove out over the wild rolling prairie as the sun was mounting the eastern horizon and commencing to drink up the dew which had collected during the shades of night. The weather was excessively hot, and great cracks in the earth attested to the extreme dryness which was then prevailing. We were obliged to carry water to quench the thirst of our heated dogs. For about three hours we had good sport, and then we were obliged to leave the field, not only on account of the heat, but because Mr. H. must

reach town in time to take the train for St. Joseph, as he had only gone out, as I said before, to get us located. When we arrived we found the rest had been driven to cover by the intense heat, and learned that in the morning Judge H. and E. had interviewed the section men, and agreed with them to take them out early on the line of the road to a point where they would find plenty of birds. As they were behind Col. L. and S. the evening before, they had high hopes of getting even, but they were again doomed to disappointment, for when they reached a part of the ground they intended to shoot over, having marked some birds down there, they were chagrined to find that their opponents, who had gone by team, were already on the ground and going through the birds at a slashing pace, loading their guns, the Judge said, on the run, and scarcely stopping to retrieve the birds as they fell.

Mr. H. taking the train for St. Joseph, we sent by him about 150 birds to be put on ice at St. Joseph and forwarded to our friends, as H. and myself had again brought in a heavy bag, which was somewhat assisted by "Old Betsey." Although we did not think to mention it, the Judge and E. concluded that as my partner was gone, and we had been particularly successful, they would go with me, so we returned with Farmer S., got our dinner, and about four o'clock drove out for the evening shoot. We crossed and recrossed the old California trail, which, starting from St. Joseph, winds its serpentine course away over the rolling plains of Kansas towards the setting sun and the Eldorado of the gold seeker. Now, however, the whole thing is changed, and the fiery iron horse, with its swiftly moving train, has taken the place of the long lines of white tented wagons which used to drag their weary way along this trail towards the Rocky Mountains, many of them bearing all the earthly effects of those pioneers who were seeking to find in a far distant land the golden grains that would make the possessor one of the wealthy men of the land, and enable him to enjoy the comforts that such wealth brings. In imagination I could see the long line as it pursued its winding course, leaving a trailing cloud of dust to mark its passage—could see the many different faces of the pilgrims to the land of promise, some of them showing high hopes in the future to come, some turned half wearily back towards civilization and home and friends they had left, for whose sake they were risking their lives and all. Again I could see some vehicle draw aside from the moving line to deposit by the wayside all that was left of the manly form and aspiring hopes that had left the far off eastern home, alas! never to return. All that waiting friends would ever hear would be, "died and buried on the road," the last words that trembled from the whitening lips being the names of the loved ones at home, no mark being left to show the resting place of the form that was once the pride and dependence of a happy home. Again could be imagined the lone wagon as it moved slowly forward suddenly surrounded by the knights of the road—a few pistol shots, the shriek of despair, a few dying groans, a hurried secretion of the murdered ones, and the team quickly driven from the trail and hurried to the retreat of the banditti.

The house at which we staid had for a long time been the headquarters of a daring band that had been the terror of the road, and many a dark deed and wild wassail had no doubt been enacted under the very roof where we were entertained. The band had flourished for a long time, but at last swift vengeance came, and all but one were found either gracing a limb or with a bullet through the head. A swift horse saved the one, and report says he still frequents his old haunts, but under a strange garb and a different name. Although the trail has long been abandoned, its course can be marked for miles by the dark, rank vegetation along its borders, that have been enriched by the bones of many a traveller and the bodies of many a worn out beast of burthen, and watered by the tears of many a homesick one on his onward way, as well as the poor and disappointed ones who were dragging their weary bodies back again from whence they started. Alas! how few that travelled that westward road ever obtained the coveted prizes and returned to their homes and friends. And how many laid themselves down to rest under the golden skies of California, their earthly pilgrimage o'er, and their weary bodies at rest.

But stop! there are a whole covey of birds dusting themselves in the road, and out we tumble and at them, one or two of the party getting a shot before leaving the wagon. The days of '49 and the gold fever are out of our minds in a moment. During the evening we had but fair shooting, and shortly after dusk we returned to the farm house thoroughly tired, and ready to pay our respects to a substantial supper that was awaiting us.

The dogs fed and taken care of, the guns put away, the next day's work laid out, and three tired fellows were

—The forests of Russia cover 470,000,000 of acres, being 71 per cent. of the whole forests of Europe. The wood of Russia is getting to be rapidly used up. In 1871 the price of wood in St. Petersburg rose 70 per cent. The estimated value of the timber cut in Russia every year is about 40,000,000 of dollars. In 1872 about 10,000,000 dollars, worth of timber was sold in England.

tucked away in their little beds, to be awakened now and then by some enterprising dog bolting in or out through the open window. Morning came full soon, for our aching limbs had scarcely recovered from the previous day's fatigue. Our fervent hope had been that there would be rain during the night to cool the atmosphere; but only a few drops was all that came. The morning, however, was somewhat cloudy, and the dew hung thick and heavy on the prairie grass. To-day we were to take a new route, and it was hoped that plenty of birds would reward our exertions. We were soon in the field, each one taking a course of his own. E. soon found birds, and the Judge, who was as anxious to keep even with him as he was to beat their opponents, soon went to help him out. They were shooting right and left, while I had not yet found birds. At last, one that they let slip came over to me, and I killed it. A short distance farther, on the crest of a hill, in some very short cover, Dash began to draw; presently he sank quietly down with his muzzle high in the air. [I am not writing about dog breaking, so I trust I may not be lectured by some professional because he did not come to a stand; but he knew what he was about as well as though he had been the image of a marble statue]. I walked up to him, when up got an old cock grouse. I pulled trigger, and down he came. I knew by Dah's actions that the old fellow was not entirely alone in that locality, and soon the covey was found, and none of them were left to swell the census of the next year's shooting except one young bird, that got up with two others, and the old hen, and she went away minus numerous feathers. By this time I was well loaded down, and I made my way back to the team, where I found the others. I had not more than unloaded before the dogs had again found birds, and we all then advanced to take a shot. The birds got up, and three were knocked down, while two more went away badly wounded, and one of them was afterwards gathered as we advanced. After the discharge, E. and myself having loaded, the Judge was busy making some very lively motions about one end of the muzzle loader. "Hold on," shouts the anxious Judge, "you fellows with your infernal breech loaders are not going to run over me in that way. You can't play any of the swine on me, and if you don't wait until I get loaded there'll be a funeral not far from here; this thing is played out." "Well, Judge, seeing it is you, I suppose we must wait; but we are pleased to inform you that a man of your standing going out amongst a covey of grouse alongside of a breech loader is not entitled to any rights that a white man is bound to respect." The Judge is constitutionally a little nervous, and we seldom let a chance go by that will put the old muzzle loader in an unfavorable position.

The few clouds that had obscured the sun and saved us from its rays were now dispelled, and things began to get burning hot—too hot, in fact, for men or dogs, and we drove to a little farm house and besought the privilege of putting our team in the stable, and an opportunity to shield ourselves from the noon day sun. Only the lady of the house was there, and she, in broken English, directed us to an adjacent corn field, where her husband was at work. He came out barefoot and bareheaded to learn our wishes, which we made known. He replied that he would go to the house with us, and returned and got an old Springfield musket, which he kept in the field to shoot at any stray "shicken" that might come along. We returned to the house, put out our team, laid our blankets in the shade of the house, and prepared our lunch. Our Teutonic friend brought forth a water melon, a dish of clabber, and an urn of coffee, and we made an excellent dinner, the Judge and E. vieing with each other to see which one could get outside of the most clabber, but the bottom of the dish being reached before that matter was decided, the match had to be considered drawn. Hans was quite loquacious, and asked, with a knowing wink, "Do you fellows belong to that barty that got fined the other day," referring to Gov. Woodson and party.

The statement went the rounds of the papers that the Governor and party *accidentally* followed a covey of grouse *across the line*. Had the originator of that statement studied his map and the facts of the case a little closer he would have discovered that between Missouri and Kansas, in the vicinity of St. Joe, flows the rapid Missouri river; consequently, the story that they were accidentally across the line won't hold water. The gallant Governor, General Craig, Frank Hopkins, and the rest of the party, may be ardent sportsmen, but it is a little too much to accuse them of wading in the "big muddy" and tramping eighty-five miles into Kansas after a covey of birds, no matter how large.

The plain, unvarnished tale can be told in a few words. The Governor and party had gone out on the St. Joe and D. C. road on the afternoon of the 14th in order to be ready for the next day, and having part of a day on their hands, and nothing to do, they concluded to drive out with their dogs and see what the prospect was. Some discussion had arisen before starting about taking guns along, when a gentleman of the place remarked, "Take them, and if you get complained of I'll pay your fine." Some little pitcher with large ears, immediately conveyed the remark to a party who, in business or otherwise, was a rival of the gentleman who made the statement. The dogs were taken out, and accidentally, of course, some guns. The dogs found birds, and accidentally somebody's gun went off. Spies had been sent out to watch, the act was at once reported, and when they returned to town they found that the laws of Kansas would apply to the Governor of Missouri just the same as to any other individual.

I trust that whoever may read this will please note that the Governor of Missouri did not accidentally violate the laws of Kansas. But I have again forgotten my mutton, and unless I adhere closer to it, for want of space the editor, and for lack of patience the reader, will never find the end of this hunt. At four P. M., the mercury still indicating 100 degrees, we took the field and had quite good success. Not one half of what we might have had, however, had the ground been damp and the weather less hot. As it was, however, we bagged sixty-eight birds. That night we again staid at the farm house, and in the morning went into town to prepare for the noon train, shortening our intended stay a day on account of the intense heat; besides, we had enough, and more than enough, birds for our friends and ourselves. We found that S. and the Colonel had taken the field, leaving instructions for the train to take them up when it came along, as they would be on the line of the road, which was done.

After we had all got together, and the contending parties began to count up, a stumbling block came in the way in the shape of Judge S., who had hunted along with the

Colonel and his brother. When he was called upon to tell how many birds he had killed he didn't know. He said whenever birds got up, and they all fired, his brother and the Colonel claimed all the birds killed, and the only way that he could get a bird at all was to shoot one when they did not see him, for if they did they were sure to shoot and then claim the bird, and he could not tell how many birds he ought to claim. So the matter was not finally settled, but was disputed *ad libitum* on the way home. The last thing I heard that night as I went to sleep was Judge H. saying, "Now, Eli, that's too thin; you know that Charlie and the old muzzle loader beat you, and you have tried to count in your brother's birds to save yourselves." A hearty laugh was the reply, and I heard no more.

For Forest and Stream.

ON THE UPPER MISSISSIPPI.

BY HAVILAND.

ONE of the most thoroughly enjoyable excursions in the whole extent of this new country of ours is the trip from Aitken to Brainerd, nearly one hundred miles down stream *via* the Mississippi River. Two years ago a party of us, now scattered far and wide, made this trip the first time it was ever done or even attempted by sportsmen; not that it was a hard or dangerous route, but from the supposition that it would be monotonous and game scarce it was given the go by.

We shipped our two boats and supplies to Aitken one afternoon, landed them carefully, poled our way down Mud River, killing half a dozen ducks in the rice fields as we passed along, and an hour or so before sun down our joyous party of six were floating down the Mississippi. As we floated along we noticed on the oozy banks frequent signs of deer, and though a little early in the season, it was unanimously agreed that for "just this once" we should, if we could, have some venison, and so shipping the oars we silently sent the boats around the curves with the paddle, hugging the brushy banks closely, but it was useless; the wary deer would smell or see us, and get out of our way quietly.

"Do you know anything about 'shining' deer, Junior," asked Senior, of the steersman in the forward boat, as they came together at the mouth of a small lake.

"I reckon," was the response, "and here is good ground for that business."

The boats were drawn on shore and unloaded, the canvas fly spread, fire lit, and our camp all in good shape at short notice while Junior busied himself in improvising a "jack." Selecting a white birch about a foot in diameter he carefully removed the bark a foot in length and pared off the edges till the roll assumed a half circle in shape, then fitting a crescent shaped piece of wood in each end, secured in place by small wooden pins, he fastened a short stout pole to one end securely, fitted two small rolls of birch bark inside, in which he placed two candles, and then secured the whole thing firmly in the bow of the boat, and a "jack" was completed; one that, if the paddler and shooter knew their business, is equal to Murray's far famed, intricate contrivance, made with a fireman's hat, plate glass front, etc.

While we do not defend or believe in the practice of jack shooting generally, we claim that when a party of sportsmen want venison, have no dogs, or do not know the country, and are particular not to shoot at anything but a buck, and only then when needed for camp use, that it is as legitimate a sport as driving deer on a runway, and it takes a cool hand both in the bow and stern of a boat to get a deer. Try it, some reader who has never had any of this experience, and though he may be a crack shot in the field or the forest, though his nerves may be as steel under ordinary circumstances, he will find that when his paddler, with noiseless stroke, drives the light boat within shooting distance of a big buck some dark night that his trusty rifle will shoot wild, or his favorite double barrel throw the buckshot over or under the game instead of into it.

All ready now, supper was eaten, and as soon as it grew dark Junior pared down the edges of his paddle to a thin, sharp edge, wrapped a handkerchief around the staff, so as to avoid any thumping in the boat, and placing Senior in the bow with a heavy double gun, took his place in the stern with a "navy six" on the seat beside him, and pushed out into and up the winding outlet.

A few moment's work and the lake was reached, and as the boat was turned towards the west side, keeping just outside of the rushes and lily pads, Senior lit the candles; the broad stream of light lit up the foliage and shore so that every object was distinctly visible. As the boat moved along without a ripple, Junior thought of his sport in the Adirondacks with cherished friends of years ago, of just such nights and just such sport in prospect on Meachem River with Criss Crandall, with his noiseless paddle behind him, or on Marion River, or lovely Blue Mountain Lake with Jim Cross or jolly Frank Hobart in the stern; but his reverie was suddenly broken as his practiced ear caught the familiar "plop, plop, plop" sound made by a deer feeding, and in a whisper Senior was warned to be cautious, and the boat's head turned towards the sound. Out of the fog and darkness rose the form of a deer, half immersed in water, looking white and spectral-like. Senior's gun was at his shoulder, he shaking from head to foot, and the muzzle of his gun describing circles in the air.

"Pass, Senior," said the paddler, "it's a doe, and her fawns can't spare her just yet," and slapping his paddle on the water away with a snort and a whistle went the frightened animal.

"Senior, keep cool, and come down to business; no buck fever allowed in this boat," was Junior's whispered caution.

"Confound it," was the muttered response, "what ails me; I was cooler and steadier up the Red River when we cleaned out Banks."

On went the boat, ripping the glassy surface of the still lake as noiseless as a knife blade, and disturbing the frogs and night birds that with many a splash and flutter got out of the way of our boat. Suddenly, to the left of us two glaring, fiery balls appeared through the darkness, and as the boat stole nearer a lordly buck stood gazing at us, head and tail up.

"Steady, Senior, and let him have it," and bang, bang spoke the heavy gun—one cartridge ploughing up the water just ahead of the boat, the other going far above and beyond the deer, who gave one or two frantic jumps and stood staring at the light, whistling and snorting like a small engine. Junior whirled the boat half round, and

cocking his revolver blazed away—one, two, three shots—the first taking effect in the fore leg, the second a miss, the third through the neck, bringing the animal down, and another shorter range shot through the head as the boat came nearer effectually laying him out. To say that Senior was wild—as he raved about his luck, his gun, his nerves, and filled the calm night full of "chin music" and double headed adjectives—is drawing it mild indeed. He pleaded earnestly for one more chance, but Junior shook his head, and loading the deer into the boat they started for camp.

"Here they come," said M., as he kicked the smouldering embers of the camp fire together, and set the tea kettle on the blaze, "and you bet they have got a deer, or Junior would not be rowing as he is; wake up, boys, and give them a hand."

As he spoke the prow of the boat touched the beach, and all hands helped carry the game to camp, where, beside the bright fire, the story as to how it was done, who did it, etc., was told. Senior had to come in for his full share of chaffing, which he bore with his usual good nature, promising the party that he would keep trying till he could "shoot a deer at night on the jump with a revolver."

Rolled in our blankets we slept the sleep such as comes only to those who enjoy life in the woods, and awoke as the sun began to show himself over the tree tops. We sat down to a breakfast (fairly earned) of venison steak, wood duck, and fish—fresh fish with the usual appropriate fixings.

En route again—down the rapid river for an hour or so without incident of note, save that Senior got a long range shot at a bear, and peppered his shaggy hide with a charge of No. 5. We ran our boats ashore at an inviting spot, filled a pail full of ripe, luscious whortleberries, and shot a few pigeons. A mile farther down we saw a camp of Chippewa Indians, and as some of our party were from the east, to whom the greasy loafers were a curiosity, it was decided to make them a call. Four lazy Indians, as many frowzy squaws, a horde of beady-eyed papposes, and a lot of mangy dogs composed the outfit. Dirty, lazy, poor, and proud of it, they lay in sullen silence and would not speak a word; even the dogs did not bark, but grumbled suspiciously at our heels. We tried to engage some of the "noble reds" in conversation, and essayed the same thing with a squaw, to whom was offered a cigar. The cigar was taken as quickly as a trout takes a fly, but no further would she trust herself. Some of the party wanted some beadwork, pipes, or something of the kind, but their mulish silence tired us all out, till a bright thought struck S., who, turning to the filthy crowd, got off the old, old story, "Have a drink, Nitchee?" Quick as a flash their expressions changed from wolfy selfishness to a hound-like begging. They sprang to their feet like acrobats, and crowded around our boats. The genial Senior seated himself in the stern of our supply boat, and drew cupful after cupful of the foaming lager (the strongest fire water we had), till each Nitchee had had a beaker. Then they were willing to talk and to trade. Bead work was found, stone pipes were produced, and one big Indian wanted to give S. his dog. Finally, the fun was brought to a sudden close by a squaw trying to kiss Senior, who, in his most pleasant tones, "begged to be excused, madam; but if another drink of beer," etc., all the time making for the boat, where he seized a paddle and kept her at bay with one hand while he proffered a cup of lager with the other. It was a picture we would have given something to have had photographed. The wild scene, the bluff in the background, the rushing river in front, and the flat boats in the foreground, side by side with the Indians' bark canoes, the grinning Indians, the perplexed Senior, the wizened old Hecate of a squaw, and the noisy sportsmen, who enjoyed it all. It was rich in the extreme, and has brought up many a laugh since then.

Onward again, with many a laugh and joke, the Indians watching us till we had rounded the point, we stopped where the trail leads from the Big Bend to Rabbit Lake. We had been told that this carry was about a mile long. We found that a woodman's mile is as long in this country as anywhere else, viz., two miles and a half. It was a warm day, our supplies were numerous, our boats heavy enough to carry, and it was evening before we got our outfit over and our tent pitched on the shore of Rabbit Lake, famed for bass fishing and duck shooting in its eight miles of outlet.

We were tired enough to go to sleep early, and as soon as supper was over all turned in. Early in the morning one party with a minnow net, made from a remnant of our mosquito bar, captured a lot of minnows, joined the others, and then, with rod and line, began to haul in the black bass, pike perch, etc., till taking them ceased to be a pleasure. On shore for dinner; then, with fish and game carefully packed amidships in dry grass, guns loaded, we were off for the outlet, which is one vast field of wild rice, with a stream of clear, bright water, wide and deep enough to float a boat, curling through it. The young ducks, able to fly fairly, were in swarms, and we had rare sport for a couple of hours. The water was low enough, and the rushes and grass held up on shore, so that we did not lose many. Two or three hours of this sport, and we had worked our way down to the mouth of the outlet, and were once more on the Mississippi, fifteen miles from Brainerd. Now, with the long oars out, one man at each, and a paddle going at the stern, we went at a rapid pace, taking all the short cuts, and availing ourselves of the currents all we could, going through French Rapids, a mile of water that runs like a mill race with all steam on, till near Brainerd the bluffs began to show themselves, and in the gathering gloom we could discern the mouth of Rice Lake outlet, and knew that our joyous trip was nearly at an end. We slacked up somewhat, letting the current bear us along, waiting for the other boat, which, being heavier, had dropped astern, and just ahead an Indian in his bark canoe, singing his monotonous chant, stole out of the sedge and started down river. He had about two boat lengths the start, but with a whoop and a yell we were after him, and our skiff fairly jumped as we three did our level best. The Indian, who did not know what the matter was, thought his time had come. Choking off his song, he threw his might into the paddle, and the bubbles began to break and foam in front of his canoe as he surged it forward. A "stern chase is a long one," always, and for all our efforts the Nitchee gained on us, and as he reached his landing he jumped from his canoe and scrambled up the bank like a big lizard, and began to cast reflections on us in the Chippewa tongue, to which we replied with the phrase used with so much effect earlier in the day, and when he came down the bank we were forty rods away. Then Mr. Chippewa did bless us, and his sarcastic remarks followed us down stream a mile. We waited for

the other boat, which soon came along, the oarsmen telling of an Indian who said "skittawaboo" to them, and acted as if he wanted to take their hair.

A few more strokes of the oars and we landed at the ferry. Our long trip was over—a trip that was enjoyed to the fullest extent by every member of the party, and one which we all agreed should be taken again some day in company.

Brainerd, Minnesota, June, 1874.

For Forest and Stream.

A WEEK'S FISHING AT WYANDOTTE.

THERE were two of us—the philosopher Diogenes and myself. Both disciples of Izaak Walton, we had provided ourselves with a complete outfit in the way of rods, reels, and all the *et ceteras* appertaining to the true fisherman. Wyandotte Cave, with its surroundings of hills, valleys, and rivers, seemed to furnish the requisite attractions, and it became accordingly the objective point of our expedition. Wyandotte is in Crawford county, Indiana, about sixty-five miles below Louisville. The daily packets of the Louisville and Evansville Mail Line, which are, by the way, floating palaces, and the tri-weekly Louisville and Leavenworth packet—Sandy No. 2—stop at Leavenworth, the nearest point by water to the Cave. The fare is \$1.50. Probably the most convenient of these packets is the Sandy No. 2, a very elegant little boat, with gentlemanly and accommodating officers, which ends its voyage at Leavenworth, thus enabling passengers to remain on board all night. Leaving Louisville at five o'clock, all the boats reach their destination before midnight. Diogenes and myself embarked on the Sandy, and in the morning found ourselves at the little rambling town, with its scattered rows of houses, nestling between the hills and the river. The scenery at this point is exceedingly picturesque. On every side are to be seen blue hills, broken into gigantic undulations, with smiling valleys between, and a fairy-looking island, set like a jewel in the bosom of the Ohio, just where Blue River embouches into the main stream. The hill which overlooks the town is at least four hundred feet in height, and commands a magnificent prospect.

There are two rival hostleries, each eager to furnish conveyances to the Cave, five miles in the interior. The fare to the Cave varies from twenty-five cents to \$1 for each passenger, according to the number of persons to be conveyed. The competition is quite spirited, and with a little adroitness an excursionist can make his own terms.

Although in many respects rough and forbidding, the road from the Ohio to Wyandotte is not devoid of interest. Diogenes saw in the overhanging ledges of rocks rare visions of subcarboniferous fossils, while every now and then we had glimpses of dense copse-wood, with tangled vines, redolent with the odor of blossoms, and wild flowers in great profusion, while Diogenes talked learnedly about families and genera and species. When Lee appeared with his "spring wagon," uncovered—a two seater, and a veritable representative of the country's means of transportation—we found that the daughter of "mine host" of the Wyandotte Hotel was to be our *compagnon du voyage*. With true country artlessness she prattled away with perfect freedom about fishing, hunting, household economy, the underground wonders of the cave, and all the innocent gossip of the neighborhood.

The approach to Wyandotte Valley is flanked by a magnificent range of hills, the highest of which is called Greenbriar Ridge. It looms up grandly to the right, stretching out with its lordly arch almost as royally as Old Crow Nest or the Storm King on the Hudson. Winding along at its base were the clear waters of Blue River, glancing through the dense foliage of the trees, making altogether an exceedingly interesting picture. We were told that wolves had recently bivouacked in its recesses, and that it was not uncommon still to find the catamount and the wild cat, of which several had been killed the previous winter. The former of these, Diogenes informed us, was one of the *Felidae*, with short ears and tail, and not the notorious panther of the wilderness. However, we were reminded that a genuine panther had been seen in the neighborhood, and that dogs whose prowess had never been at a discount had come back from a contest in the dense thicket torn and bleeding, and completely whipped. Sheep and hogs had mysteriously disappeared, and a pet deer had been spirited away to a cave, at the mouth of which a wolf trap had been set and a large catamount captured. It was a wild region, indeed, and Diogenes grew enthusiastic at the prospect of adding something more *recherché* to his list of trophies than an innocent black bass or an ungainly catfish.

Wyandotte Hotel is near the mouth of the cave, built on the side of the hill, overlooking the long reaches of the river and the beautiful little valley which bears its name. It is kept by Mr. W. H. Conrad, a genial host, with an interesting family of girls and boys, all of whom seem to vie in paying attention to their guests, and who contribute in many ways to make a week's stay at the hotel exceedingly delightful.

The northernmost flank of the Greenbriar juts out to a fine sheet of water, formed by an extensive mill dam, near which is an old mill owned by the Messrs. Rothrocks, whose family own the cave and the land for many miles around. The mill is a primitive affair for grinding wheat and corn and for sawing lumber.

Some gigantic elms threw a cooling shade over the river, and here we found a convenient fishing ground. Blue River is a beautiful stream, and at the time of our visit was quite clear, with occasional rapids, down which the waters danced and sparkled, reminding us of some of the mountain streams of the Alleghenies. It is rarely more than ten or fifteen yards in width, shut in on both sides by giant elms and sycamores. It would seem to be quite possible to stock it with game fish, of which there are many representatives already in its waters. The warmth of the water, unfortunately, precludes the possibility of its ever having any trout, although in other respects it is well adapted for this admirable fish.

We had provided ourselves with a supply of flies, hoping that the black bass might be tempted with the alluring appearance of the brown hackle, but we soon found that it required all the delicate manipulation we were master of, with the liveliest of minnows, to induce them to leave their hiding places. The black bass (*Micropterus nigricans*) is a very capricious fish, and when he is not in the proper mood no amount of coaxing will tempt him to bite. During the month of March the weather had been exceedingly warm, and a great many bass had been taken; but now, even in the latter part of May, after several days of industrious fishing, we only succeeded in catching a very few.

With a few feet of a rise in the Ohio the fishing would become excellent, and at this point hundreds could doubtless be taken in a few hours. We caught, also, a number of the rock bass (*Ambloplites aeneus*—Agassiz), which is nearly as abundant as the black bass, and equally as game. The sunfish (*Pomotis vulgaris*) was quite numerous, and larger than we have usually found. Barring the multitude of bones it is not to be decried. To the infinite disgust of Diogenes, we were exceedingly lucky in catching catfish (*Pimelodus*), of which we found two species. As most of the species of this fish are exceedingly active, taking the line with a vigor worthy of a better fish, it would hardly seem to deserve the anathemas of Frank Forester and his followers. In some of the long, deep reaches of the river the pike was said to abound, which doubtless makes sad havoc among the lesser fry. While we were fishing a pike nearly four feet in length was caught, and several others still larger had been taken a day or two before. A few miles above one over seven feet in length had become entangled in a mill wheel, and was taken by hand in a disabled condition. It is a pity that these voracious monsters cannot be exterminated. Another destructive fish was found in large numbers—the bony pike (*Lepidosteus*), with its long, hard snout studded with rows of sharp teeth. Diogenes has perfected a plan for their extermination, and it is therefore hoped that future piscators may escape the annoyance to which we were subjected. A water dog, with very little of the canine in his appearance, was also added to our list of nondescripts. It was quite distinct from the animal caught in the western waters, and called mud devil by the fishermen. Diogenes considered it a lucky "catch," and made a careful drawing of it on the spot. He declared it to be a rare specimen of the family *Amphiumidae*.

A visit was made during our stay to the famous Wyandotte Cave, which in many respects is a rival to the Mammoth Cave of this State. Monument Mountain, 175 feet in height, with Wallace's Grand Dome overreaching it fifty or sixty feet above, has nothing to approach it in the far-famed Mammoth. It is about thirty miles in extent, and it would require more than the space of this article to give merely the names of the places of interest. No one visiting this part of the country should fail to see it.

The utterly secluded life, and the pastoral habits of the people who dwell in the neighborhood, may be imagined when we were told that three exceedingly handsome young ladies, whom we met, belonging to a family of considerable wealth and influence, had never been but a few miles from their native Wyandotte Valley. They are sweet, guileless children of Nature, whose dream of innocence and peace it were a pity to break with the realities of our false outer world. Like Wordsworth's Lucy we thought of each—

"A violet by a mossy stone
Half hidden from the eye!
Fair as a star, when only one
Is shining in the sky."

Board at the Wyandotte Hotel is but \$7 per week, and every attention is paid to guests with a genuine good will, which makes up for the lack of many of the conveniences and comforts found at more fashionable places of summer resort. It is the quietest, pleasantest place we know of for a fishing or hunting excursion in this region, and it will be a matter of regret with the genuine lover of such sport when Wyandotte should become more staid and fashionable, and less fitted for a week's recreation in the woods.

Louisville, Ky., June 5, 1874.

Rational Pastimes.

Secretaries and friends of Athletic, Base-Ball, Cricket and other outdoor Clubs will kindly mail their contributions not later than Monday in each week.

—The Boston cricket club, which recently defeated the St. George club of this city on July 10th, played against the base ball eleven of the Boston Red Stockings, and the ball tossers beat the cricketers in handsome style. This speaks well for their games in England next month. The Bostonians were disposed of for 28 in their first innings, the "Reds" scoring 50. In the second innings the cricketers scored 54, which the base ball players offset with 93, thereby winning by a score of 143 to 82. The cricketers found Harry Wright's medium paced twisters as bothering as they did George's "pacers."

—The second eleven of the Manhattan Cricket Club and the Staten Island second eleven played at Staten Island, July eleven. The latter won by a score of 76 to 67.

—On July 9th the newly organized Mechanics Club of Orange, defeated an eleven from Newark, in a one inning game by 70 to 40, on Orange street, Roseville.

—The Atlantics played the Live Oaks, of Lynn, on Friday, and though the Chicago nine only defeated the Lynn amateurs by 12 to 4, the Atlantics beat them 20 to 6.

—The Chelseas defeated the Nassaus in an exhibition game played at Oneida, N. Y., last week by a score of 19 to 17. The Nassaus afterwards defeated the local Oneida club (the Ku Klux) by 10 to 10.

—Up to Saturday, 111 of the 280 games to be played in the professional arena up to October 31 had been finished, leaving 169 to be played within the next three and a half months, or about fifty games a month. This number the clubs cannot play within the specified time.

—The Atlantic professional nine visited Lynn, Massachusetts, on July 10th, and there played with the State amateur champions—the Live Oaks—and won by a score of 20 to 6. The Live Oaks played the Chicagos a game marked by 12 to 4 only.

—The value of having a change of pitchers in a nine, of opposite styles of delivery, was strikingly illustrated in the match played in Philadelphia last week between the Girard College nine and the Americus nine. The College team closed the third innings with a score of 12 to 5 in their favor, and the game became too one sided to be interesting. In the fifth innings Toner was substituted for Fulmer as pitcher on the Americus nine, and the result was that in the seven innings which followed the College boys only added three runs to their score, while the Americus gradually pulled up their score to even figures, and then won by one run. The score was as follows, eleven innings being played:—

Americus.....0 1 4 1 5 0 0 3 1 0 1—16
Girard College.....3 4 5 0 0 0 0 2 1 0 0—15
Time, 2:15; Umpire, Mr. Nolen.

—On June 20th a remarkably fine game was played at Oberlin College grounds, Ohio, in which the Freshmen of the college beat the Seniors by 7 to 4 only.

—The record of the Yale club up to July 14th is as follows:—

PROFESSIONAL GAMES.			
April 18, Hartford.....	12; Yale.....	2	
May 6, Hartford.....	6; Yale.....	4	
May 27, Atlantic.....	8; Yale.....	3	
June 10, Atlantic.....	15; Yale.....	12	
June 12, Hartford.....	17; Yale.....	8	
June 21, Athletic.....	11; Yale.....	0	
June 30, Hartford.....	7; Yale.....	0	
July 1, Hartford.....	9; Yale.....	8	
July 3, Baltimore.....	15; Yale.....	4	
July 4, Baltimore.....	7; Yale.....	6	
July 6, Mutual.....	21; Yale.....	1	
AMATEUR GAMES.			
May 9, Flyaway.....	5; Yale.....	15	
May 30, Nameless.....	9; Yale.....	16	
June 6, Knickerbocker.....	5; Yale.....	9	
June 29, Princeton.....	1; Yale.....	16	
July 1, Princeton.....	3; Yale.....	11	
July 13, Harvard.....	—; Yale.....	—	

—The record of the professional championship contests up to July 14th is as follows:—

Club.	Games Won.	Lost.	Total.
Boston.....	28	7	35
Athletic.....	22	10	32
Mutual.....	16	15	31
Philadelphia.....	13	15	28
Chicago.....	11	15	26
Atlantic.....	9	15	24
Hartford.....	8	15	24
Baltimore.....	5	21	26
Total.....	113	113	231

—The record of games played to July 14th by the championship nines is as follows:—

July 7—Athletic vs. Atlantic at Philadelphia.....	5 to 2
July 7—Hartford vs. Philadelphia at Hartford.....	15 to 2
July 8—Chicago vs. Baltimore at Chicago.....	9 to 1
July 8—Atlantic vs. Philadelphia at Brooklyn.....	11 to 5
July 9—Philadelphia vs. Mutual at Brooklyn.....	6 to 5
July 10—Hartford vs. Mutual at Hartford.....	13 to 4
July 11—Chicago vs. Baltimore at Chicago.....	17 to 12
July 11—Athletic vs. Philadelphia at Philadelphia.....	8 to 7
July 13—Atlantic vs. Hartford at Hartford.....	6 to 2
July 13—Chicago vs. Baltimore at Chicago.....	13 to 6
July 13—Boston vs. Athletic at Boston.....	7 to 6

—The base ball tourists are to leave Philadelphia to-day July 16th—in the American Line steamer Ohio. The players of the party are as follows:—

Boston.	Athletic.	Position.
J. White	J. E. Clapp	Catcher
A. G. Spalding	J. D. McBride	Pitcher
J. O. Rourke	W. D. Fisher	First base
R. C. Barnes	J. Batlin	Second base
H. C. Shafer	E. B. Sutton	Third base
George Wright	W. H. McLeary	Short stop
A. J. Leonard	A. W. Gedney	Left field
Harry Wright	J. F. McMullen	Centre field
C. L. McVey	A. C. Anson	Right field
G. W. Hall	T. Muran	Substitute
T. L. Beal	A. J. Reach	Substitute
S. Wright, Jr.	J. P. Sanderfer	Substitute
J. F. Kent	H. Gurne	Substitute

Mr. Alfred H. Wright goes out as scorer and correspondent. The programme of the tour is as follows:

- July 30. Athletic vs. Boston, at Liverpool.
- July 31. Boston vs. Athletic, at Manchester.
- Aug. 1. Athletic vs. Boston, at Sheffield.
- Aug. 3, 4, 5. The English Twelve of 1872 vs. Eighteen of America, at Prince's grounds, London.
- Aug. 8. Athletic vs. Boston, at Richmond cricket grounds.
- Aug. 6, 7. Prince's Club Eleven with professionals vs. Eighteen of America, at Prince's grounds, London.
- Aug. 10, 11, 12. Athletic vs. Boston and professional nine vs. Paris players, at Paris, France.
- Aug. 13, 14. English Eleven vs. Eighteen at cricket, at the Oval, London.
- Aug. 15, 17. American vs. English, at cricket, at Sheffield.
- Aug. 18, 19. American vs. English cricket, at Nottingham.
- Aug. 21, 22. American vs. Irish, at Dublin, cricket and base ball.
- Aug. 24, 25. American vs. Scotch, at Glasgow, cricket and base ball.
- Aug. 26. American vs. English, at Huddersfield (Lancashire Hall).
- Aug. 27. Sail for home.

The Paris trip may not take place, in which case they will play a match at the Surrey Club grounds.

—On July 10th Captain James Ward of the Chicago Base Ball Club, had his right leg amputated above the knee in order to save his life from the poison of a malignant abscess, occasioned by the decaying of the bones of the leg.

New Publications.

Publications sent to this office, treating upon subjects that come within the scope of the paper, will receive special attention. The receipt of all books delivered at our Editorial Rooms will be promptly acknowledged in the next issue. Publishers will confer a favor by promptly advising us of any omission in this respect. Prices of books inserted when desired.

THE RHINE. A tour from Paris to Mayence by the way of Aix la Chapelle. By Victor Hugo. Boston: Estes & Lauriat.

In this translation of Victor Hugo we have one of the most charming, interesting, and spirited books of the day. This translation does full justice to the author, and in its ample pages he is as ever true to himself. In his tour of observation along the picturesque meanderings of the Rhine the same versatile genius, the same vivid, poetic and expressive narration gilds this delightful pleasure trip with a beauty rarely known. This story is told in all its minor, as well as grander parts, with a finish and an artistic power possessed by few translators of the present time. No wonder he enjoyed a trip up the Rhine, or that his descriptions sometime glow as with rays of golden light.

"Born where blooms the Alpine rose,
Cradled in the Boden see,
Forth the infant river flows,
Leaping on in childish glee;
Coming to a ripper age
He crowns his rocky caps with wine,
And makes a gallant pilgrimage
To many a ruined tower and shrine."

Fall to the overflowing with beautiful, forcible and really poetic descriptions, noble thoughts and aspirations, is this last book upon the Rhine, we reluctantly lay it aside, heartily commending it to each and all of our readers.

—The Military Committee of the Connecticut Legislature visited Meriden on Thursday last for the purpose of locating a rifle range. Exact position of range as yet undecided.

THE STORM.

THE rain fell thick and fast,
The storm-cloud brooded low;
The night wind rang with a sudden blast.
Like the sound of a coming foe.

The billows scattered foam.
The mountain waves were white;
Ah! for the ships that came sailing home
From distant seas that night!

God! didst Thou hear the prayer
That rose from pallid lips?
Christ! as of old, didst Thou meet them there—
The wildly tossing ships?

Thro' all that weary night,
Her white and trembling hand
Held in the casement a flickering light
To guide her love to land.

The sun rose o'er the town,
And sparkled on the sea—
The Storm King flung his sceptre down.
And peace reigned royally:

The song bird trilled a note,
And warbled wild and free;
Two idle oars and an empty boat
Were drifting out to sea!

St. JOHN, N. B.

—Maritime Monthly.

Fish Culture.

This Journal is the Official Organ of the Fish Cultur-
ists' Association.

WHY SHAD HAVE NOT BEEN FOUND ABOVE THE HOLYOKE DAM.

PUBLIC expectation, not only in regard to fish culture, but as to many other mundane matters, is terribly impatient. Exactly as a child plants a seed in the earth and digs it up again within the hour, to see if it has sprouted, so do we children of larger growth express our dissatisfaction at what we deem to be the slow progress Nature makes. But this is not the worst of it. We even require, at times, that certain phenomena should occur for our special benefit, which are diametrically opposed to natural laws. We instance particularly the very premature dissatisfaction expressed in regard to the absence of shad above the new fishways at Holyoke, in the Connecticut river and the Susquehanna above the Columbia dam. Last week we published a letter from Professor Baird dated the 22d of June, which letter unfortunately had been delayed by us, from want of room two weeks. In his correspondence, the chief commissioner explains fully why it is impossible that shad could be found above the fishways, for the simple reason that we ought not to expect shad to ascend above the point where they had been introduced as young fish, and that no shad had ever been placed above these dams; or at any rate not long enough before this summer to have attained maturity. Marvellous though it may be, once the action of anadromous fish is fully understood, the matter becomes wonderfully simple. Professor Baird states as follows:—"It is one of the axioms of fish culturists, and that upon which the efforts at stocking rivers are essentially based, namely, that the fish return to spawn to the place where they were born, or where they were first introduced into the rivers." Now, it seems certain, that no young shad ever were put above Holyoke dam, and that though fish were hatched out at Newport, Penn., above the Columbia dam, it is too early to expect them to return. If young fish were put this season in the Connecticut river, above the dam, it might be fully three years before we could find out whether they would return. Not until 1876-7, can we be able to decide whether the young shad, first quickened into life in 1873, will start up stream, pass the fishway, and be found above it, searching by some mysterious instinct for the exact place of their birth, in order that there and there only they may reproduce their kind.

The chief commissioner of fisheries therefore begs a suspension of public opinion until the proper time shall arrive. If life is short and art is long, the same remark holds good as to fish culture. It is asking too much of nature to bid her hurry up, regardless of her laws, in order to please our childish impatience. It is well for her and for us that she bides her time.

For Forest and Stream.

THE HABITAT OF THE BROOK TROUT.

THE possibility of enlarging the extent of the habitat of the brook trout is worthy of consideration. Much ignorance exists, even at this day, as to the conditions necessary to the life and sustenance of the speckled beauty. The brook trout has a much wider range on this continent than the salmon; he does not depend upon access to Arctic seas, because although kin to the *salax*, he is not anadromous, and is found in headwaters of streams flowing into the Gulf of Mexico as well as those debouching into the cold waters near Labrador. Most men living in the north think that there are no trout south of Virginia. This error is on the increase, because in the south they call the black bass trout, and except where the brook trout is abundant, do not understand the distinction between the two fish. Now it seems to me that the brook trout may be introduced in any stream of pure clear water, which does not rise in temperature above 60 deg., if it be sluggish, or above 65 deg., in lively rapid water, in the hottest day in the year. No matter where this stream be, even if it should be in the Torrid zone. To be clear, the headwaters of the Amazon in South America may have trout introduced into them if you only go high enough up to reach the right temperature. Trout cannot be injured by the unsuitableness of the lower

part of the stream as salmon may. Trout are found in America on the Atlantic side from Maine to the extremity of the Appalachians in Alabama. If this theory be true there are many streams now barren of trout that might be made to teem with this valuable fish. Near Sewanee, in Tennessee, there are many streams, like Elk River, clear, with sandy, gravelly bottom and fed by springs at short intervals all along their course, and so cold in some places that swimmers dislike to swim them near the large springs springing up close to the banks or in the very beds themselves. This stream has a good many black bass in it, and used to be full of that fish. The natives here seine the streams without mercy, and now many are barren which used to abound in fine fish. Some of the lovers of the rod mean to try this stream with the fly to test whether black bass here take the artificial morsel. They have been caught here by casting a live minnow near them in a clear stream and might be induced to take the fly, we think, especially as they take greedily the "red bob," as the fishermen here call it, trolled from a dug-out. If there be any hidden reason why trout streams may not hereafter exist in high elevations in low latitudes, we would like to know through your columns from some of your able correspondents. Limestone water does not kill them, for I have caught them near Leesburg, in Virginia, in a spring branch flowing from a limestone spring. If the watery citizens here take the fly you will be notified. T. W.

UNITED STATES FISH COMMISSION.—Here is a brief letter relative to the efforts now being made under the present Congressional appropriation, to introduce shad to the western waters. One batch, taken from the Connecticut has been delivered, and a second (herein referred to) is by this time probably at its destination:

HOLYOKE, MASS., July 12th, 1874.

ED. FOREST AND STREAM:—

Just arrived from Bellfountain, O., last night and leave for Elkhart, Ind., to-morrow. We (United States Fish Commissioner) are whacking the shad through lively. Had no chance to fish with fly here, too much rain and muddy no water; saw a boy take one last Wednesday. Many fishing from the bridge then; but water too cloudy. They haul a shad up from the water in the bridge, I should think 35 or 40 feet. From the bridge they fish with long hand lines, but use rods from boats.

FRED. MATHER.

Natural History.

AUTOPSY OF A SALMON.

BY THADDEUS NORRIS.

IF an inquest is held before applying the knife, and the coroner asks "from what cause does this form of symmetrical proportions and glistening exterior lie before us? from a natural death or one of violence?" the angler replies "from a natural death." "What" says the coroner, "is there not a deep wound made by the gaff you hold in your hand, and is not the blood still oozing from its side?" "True sir," rejoins the angler, "and yet it was a natural death, though initiated in artifice and consummated in violence. You see, sir, this despot in his ocean home, this aristocrat, this bright mailed, roving cavalier, is native to, and spends his summers in, this river. After surmounting that pitch of three feet, he stopped just on the brink, as is the custom, and I essayed to break a lance with him, or rather gave him opportunity to break this seventeen foot ashen withe. So I deftly east my gauntlet of fur, feather and hook on the brim of the pool just above, and as it swung with the current over his lair, his predatory nature prompted him to seize it. To recover my own there ensued a long contest in which I vanquished him. And how could he die a more natural death than by an angler's hand?"

Let us pause a few moments in admiration over the body of this fresh run salmon. The substance which imparts so brilliant a lustre is secreted in the skin just beneath the scales, which are entirely transparent, and corneous. The distinct line extending from the upper portion of the gill cover to the root of the caudal fin is formed by perforations in the centre of those scales. Why these perforations? Take off one of the scales and you will find upon the inner surface, almost invisible with a microscope, a minute tube which penetrates the skin. It is a branch of a longer duct originating in the glands of the head, where a mucous substance—such is the accepted theory—is secreted, and transmitted along the body through the apertures in the scales of the medial or lateral line, thus forming a lubricating coat of slime which defends the skin from the action of the water. The main tube is plainly to be seen on cutting a salmon transversely.

Beginning at the head is also a thick, tough cord, somewhat flattened, buried in the muscles, and running down to the posterior portion of the first dorsal fin; then commencing anteriorly, it continues and crops out in the cartilaginous projection called the adipose fin, thus forming a somewhat ornamental terminus.

Between the skin and the muscles—or pink tinted flesh, as most persons see it—from head to tail, encircling the body, there is an elastic tissue filled with gelatinous fat, somewhat like the blubber of a whale, although in smaller proportion. This tissue becomes thinner as summer and autumn pass, and the days and nights of procreation come on. In it is stored the aliment which it acquired on its marine feeding grounds and which sustains its gradually wasting body for long months; for it does not feed in the river, no food ever having been found in its stomach there.

We will boil the half of this salmon presently in our camp kettle, and between the flakes of flesh find a thick curd; an evidence of high condition. This is the connecting tissue, dissolved at first by moderate heat, then, like other albuminous liquids, coagulated in further boiling. This also wastes away as the season advances and the roe and melt are proportionately developed.

Let us consider of this rapid swimmer and wonderful vaulter. First of all comes the pectoral fins, projecting from the humeral bones, and if allowed the comparison, analogous to the arms in man. These with the ventrals, half way down, and the caudal or tail fin, are its propellers. The caudal, which in a salmon of sixteen pounds, and thirty-three inches long, has a spread of nine inches, is many

times more powerful than all the other fins combined. It is sometimes moved as a sculling oar, acts as a rudder, and is the chief power in leaping a cataract; a depth of water below, however, being necessary that the fish may acquire impetus; just as a boy takes a good run to make his best jump. The caudal is also sometimes mischievously used—though rarely—in slapping at a fly on the surface, and thus is hooked as the trout is, in or near the tail, by the angler's counterfeit. If we observe the motions of fish in an aquarium with glass sides we will find that the pectoral fins are used alternately, and sometimes with a backward motion with the evident object of keeping the body, for the time, in a fixed position.

The anal and large dorsal serve to keep the fish "on an even keel." The second dorsal, which, as before stated, is a mere adipose cartilage, is a distinguishing characteristic of the *Salmonidae*; and although apparently entirely useless to its possessor, is sometimes turned to account, by punching a hole in it, or clipping, or slitting, or attaching a thin piece of metal, to note the growth of the fish on its return from sea.

Let us take off the head. Opening it beneath we find a series of leaflets, called gills, suspended on arches termed "os hyoides." Each leaflet is covered with a tissue of innumerable blood vessels. The water drawn into the mouth in breathing passes out through the gill covers, while the air in the water is retained and acts on the blood, which is constantly impelled from the heart through the gills. The venous blood, after being changed into arterial by its contact with the air, passes into the arterial trunk, under the spine, and is dispersed through the body by diminishing blood vessels, again to return to the heart through the veins. For this reason the blood of a fish is always cold; sometimes beneath the temperature of the water it inhabits.

Immediately beneath the back bone is the air bladder, divided into two lobes, which, by contraction or expansion assists the fish in rising or sinking, or maintaining any desired elevation in the water. Thus in still water, as a net is drawn in, the bubbles on the surface are an indication of the catch, as fish instinctively discharge air that they may sink to the bottom. In connection with the gills, the air bladder is analogous to the lungs in land vertebrates. The gills are exceedingly tender. If the anglers' hook pierces them ever so slightly, a bleeding at the lungs, it may be termed, is a sure precursor of death.

The stomach and viscera, as will appear to the most careless observer, are simple. The former is crooked abruptly, and the food, after passing the turn, is always decomposed. In predatory species the tail of the victim may be in the throat while the head is being gradually dissolved in the posterior portion of the stomach of the captor.

No one ever sees a salmon with a protuberant belly—as we frequently see a pike, a perch or a trout—unless it be in autumn in a gravid fish. The cavity in a salmon is exceedingly small, and the flesh on the belly of one of twelve pounds, when in condition, is at least an inch thick. And thus, with its small head, it probably gives more edible food for its weight than any other animal. There is hardly a pound of offal in a fish of the weight just named. Unlike other fish, which are considered light food, a pound of its flesh is estimated to contain as much nutriment as a pound of beef. On the river the angler soon becomes cloyed and tired of fresh salmon.

The timbers composing the frame work of this fast craft are well worthy of study. The backbone is composed of a series of round bones so joined as to give easy lateral motion, and one who has hooked and played a salmon is well aware of the supple and powerful play of that backbone. There are fifty-seven of these vertebrae, from the upper surface of which arises a series of bones connected by a membrane which gives attachment to a thick layer of muscles. To the latter the dorsal fin is attached. There are thirty-one neatly curved ribs on a side, forming a graceful arch. These are strong and elastic, each fixed on its own vertebra by a movable joint, to accommodate the increasing mass of eggs as the time of spawning draws on, when, as in the shad, the ova equal about one fifth of the fish's weight.

As is the case with the shad, they frequently die from the exhausting effect of spawning. An abrasion of the skin is very apt to prove fatal, while a severe gash generally heals, although it may leave an ugly mark or even deformity. I have seen a trout recover and thrive with half of its under-jaw torn off by a hook. I have also killed a salmon late in the fly-fishing season with a healed wound almost as deep as the backbone, made a few months before by an Indian's spear.

There is a way of setting up the skeleton of a fish, which, has been adopted of late years by expert taxidermists, showing the minutest bone in its structure. Thus, when an interesting specimen has even become putrid, the angler or naturalist may at least preserve the frame work.

ICTHYC FAUNA OF NORTHWESTERN AMERICA.

EDITOR FOREST AND STREAM:—

The ichthyic fauna of Northwestern America are probably less known than those of any other portion of the civilized world, and this fact may be attributed to the want of interest manifested by our Government in such matters, and also the scarcity of scientific men who are interested in ichthyology, or else their lack of time to prosecute the study in this distant quarter. The amateur in this science has many difficulties to encounter in classifying the various species, as he must be far distant from authorities on the subject out here, and even were books of reference convenient, he would find it a difficult matter to know which nomenclature to adopt, and still more difficult to reconcile the discrepancies between the various authors, for the greater number differ in many important points necessary to the proper identification of a variety or species but comparatively little known. Our remarks, therefore, must be limited to general outlines, rather than to the technical detail which men of science require; but we have had one advantage—the study of the varieties in their native element—which the scientists do not always possess, and this may atone in some degree for the absence of a thorough technical description.

It may be asserted as a general remark, that though the rivers in the greater portion of the northwest lying between the 35th and 50th parallels never freeze over, yet, only the few species of fish of the many frequenting them, are constant residents. The principal of these are the salmonidae family, excluding, of course, those that enter them to spawn. The most prominent features of the ichthyic fauna of the Pacific region are the cataphracti, or mailed cheeks, the embiotocoids, or viviparous family, the heterolepids, and the trachinids.

The gadoids are represented by a cod and a whiting; the pleuronectids or flatfish are very abundant, though we have no rhombus or turbot. The scamberoids are very scarce, as comber or mackerel, a pelamys and

two caranx being all that is known; and even the latter are confined to the California coast. "We have no sparvids; the sphyraenids are represented by one species, and the sciaenids are similar to their Atlantic congeners. The halibut (hippoglossus) is very abundant in the ocean and off the mouth of the Straits of Fuca, but is not caught. The ophiodoids, so far as known, are confined to two species, an ophidion and an ammodytes; the scopolids to one, a saurus; the lophobranchs to one, a sea-horse; the percidae to a sebastes, or rock fish; the gasteroids to two species of stickle-back; the cottoid family is quite numerous, for those miserable sculpins are found almost everywhere; the pimolodus, or cat-fish, grins in many localities; the ganoids are represented by a monster sturgeon; the cartilaginous fishes are displayed by skates and a few sharks; the herrings by two species, the clupea and meletta; the anchovy by one, an engraulis; we have no shad (alosa), and our fresh waters boast of no silurids. To atone for this omission we have, however, the finest salmonidae in the world, both in our salt and fresh waters; splendid trout in all our brooks and lakes, and their prototypes in the sea smelt, of which there are two varieties, the osmerus and thaleichthys. The salmonidae are not only the most important in edible quality and commercial importance, but also the most interesting to anglers.

MORTIMER KERRY.

EDITOR FOREST AND STREAM:

JAMAICA PLAINS, Mass., July 4th, 1874.

In a late number of FOREST AND STREAM you express the opinion that the cisco of Geneva Lake, Wis., may be a grayling. I have seen that fish and believe it to be a *coregonus*, allied, if not identical with the cisco or lake herring of the great lakes. Geneva Lake is extensive and deep, and this fish only appears about June 15th for two or three days, when the shad fly (*ephemera*) is on the water. Then it is taken in great numbers with the natural fly, and also with imitations. When the fly disappears the fish seeks the depths of the lake again and is not seen till the next June. Many of the Wisconsin lakes contain various species of *coregonus*, but I am not aware that any of them have this habit of the species found in Geneva Lake. The cisco I have taken in quantities with the artificial fly at the foot of the Sault St. Marie Rapids, and at other places with bait.

S. C. CLARKE.

CENTRAL PARK MENAGERIE.

DEPARTMENT OF PUBLIC PARKS,
NEW YORK, July 12, 1874.

Animals received at Central Park Menagerie for the week ending July 11, 1874.

Three white Guinea fowls, *Numida meleagris*. Presented by Mr. J. Van Schuick.

Two white-backed, piping Crows, *Gymnorhina leucocoma* Hab. South Australia.

Cue Zebu, *Bos indicus*.One red Fox, *Vulpes fulvus*. Presented by R. Protheroe, Esq.One Raccoon, *Procyon lotor*. Presented by Master Newton Quick.

One grey Squirrel, *Sciurus carolinensis*. Presented by Master Howard C. Stone.

W. A. CONKLIN.

Woodland, Lawn and Garden.

CULTIVATION OF THE STRAWBERRY

IN order to have fine, large, melting fruit you should bear in mind this one fact: Effectually remove all the runners. You will be quite astonished at the results produced by this mode of cultivation. Whenever I wish to grow a very large fine berry I always carefully remove the runners; by this mode of cultivation I concentrate the full force or growth of the plant in the original stock, and by this means I produce a much enlarged, stronger and very compact plant. I have taken a Wilson plant, (every cultivator knows of this variety,) and enlarged it until I have gathered from a pint to a quart from one plant. I set my strawberry plants thus to be cultivated on slightly elevated ridges, and I always manure these ridges well with a well-rotted old manure. After my bed of strawberry plants are thus prepared to grow large quantities of berries, of course I give them the very best of treatment, knowing that they will repay my culture. Before budding I usually apply to the plants thus treated a generous supply of liquid manure twice each week, at night, for six or eight weeks, until I notice the white of the buds begin to show, then I discontinue this application, as it would be of no benefit, but rather an injury. The usual rains now falling will be all that the plants require, unless a very dry time should make an occasional watering necessary.

The liquid manure used is made from one pound of Peruvian guano to half barrel of water, or cow manure—half bushel free from straw to two-thirds of a barrel of water—and delivered upon the plants from a watering-pot; the plants for this mode of cultivation should be set two feet apart, which gives ample room to place clean mulch or straw around them, which keeps the berries from the earth, which after heavy rains will incorporate with the soil and rot and injure the berries. Berries grown by this manner of cultivation will be much larger than when the runners are left. If you wish to cultivate plants for sale the runners must be left to grow, as from these you obtain your propagating plants.

You will always find it of advantage to notice this fact, which may truly be said to apply to every cultivated plant, every green thing—that very much, after all, depends upon the nature of your soil, as well as your mode of cultivation. There are many persons who call themselves good cultivators who say that to "remove the runners from their plants takes too much time." I am convinced it is the only way to get the best and the largest quantity, and the best quality of this rich fruit.

OLLIPOD QUILL.

SAVING SEED OF FUSCHIA.—Mr. Cannell, well-known as an English grower of fine fuschias, in relation to saving, advises that, when the seed pods are thoroughly ripened, they be partly dried in the sun, after which they should be cut in halves and quarters with a moderately sharp knife, and each part minutely examined. The old self-colored varieties produce seed very freely, but the choice kinds very sparingly, particularly the light varieties. An abundance of hollow seed will be found, but good plump seed is about half the size of that of the pansy, and is easily distinguished and picked out.

THE FORESTS OF AMERICA AND EUROPE.—The following estimate of the extent of the woodlands existing in different countries has just been prepared by the Committee on Public Lands and embodied by them in a report to the House:—

<i>Per cent of Woodland.</i>		<i>Per cent of Woodland.</i>	
Norway.....	63	United States.....	25
Sweden.....	60	Belgium.....	18
Russia, in Europe.....	40	France.....	17
Germany.....	26	Switzerland.....	15
Sardinia.....	12	Denmark.....	5
Holland.....	7	Great Britain.....	5
Spain.....	5	Portugal.....	4

In the United States, the Southern States come first, with amounts of from forty to sixty per cent. The Eastern, Middle and Northwestern States from twenty to forty per cent., and the Western and Prairie States from five to twenty per cent. Illinois is placed at nineteen, Wisconsin twenty-nine, and Iowa sixteen per cent. Nevada, Arizona, Dakota, Colorado, Utah, New Mexico and Wyoming are comparatively treeless. Of pine, the estimate is in feet:—

Maine.....	1,500,000,000
New York.....	900,000,000
Pennsylvania.....	7,000,000,000
Michigan.....	50,000,000,000
Minnesota.....	18,000,000,000
Wisconsin.....	16,000,000,000
West Virginia.....	7,000,000,000
Virginia (yellow pine).....	150,000,000
South Carolina.....	90,000,000
North Carolina.....	1,600,000,000
Florida.....	1,700,000,000
Georgia.....	1,500,000,000
Total east of Rocky Mountains.....	105,410,000,000
Dominion forests.....	73,000,000,000
Total east of Rocky Mountains.....	178,410,000,000
West of Rocky Mountains.....	70,000,000,000
Total United States and Canada.....	248,410,000,000

POISON IVY.

FOND DU LAC, Wis., June 27th, 1874.

EDITOR FOREST AND STREAM:—

In your issue of June 4th you ask for information in regard to remedies for the poison of the ivy plant, and as I have suffered and retain some sympathy for fellow sportsmen, I write what I know of the pest and the remedies for it.

The poison is communicated to those susceptible of its action by contact, either with the juices of the plant or a fine powder that is upon the outside of the leaves. The first acts very violently, and much quicker than the latter, and really has no cure at times. In May and June the plant is most to be dreaded, as it seems to lose its poisonous qualities somewhat as the plant ripens and the leaves brown. As a preventive I have often heard of persons eating the leaves of the plant early in the spring, an experiment that I once knew to prove fatal and is not to be relied upon. Just as the poison will affect some and not others, so will different remedies act upon persons who are poisoned. Sometimes wet salt bound on the poison-spots and kept wet, will soon dry them up. Very strong ammonia applied frequently as soon as the poison appears is an excellent remedy. This remedy is sometimes severe in its effects, acting as a caustic on the poison spots after the poison is killed. When ammonia fails, powdered gum myrrh, shaken up in sweet oil and used three times a day as a wash, will be found an almost unfailing remedy. When obtainable, it is the best to apply at first.

Preventing the poison is a difficult matter, as the powder will remain upon the clothing for days, and then, when damp, will poison the skin afresh. The last remedy named above has been used successfully as a preventive, by liberally anointing the skin before going into the woods, always allowing the remedy to dry on the skin. The only sure preventive is to stay at home, which, in some cases, is worse than the disease.

[It may be regarded as a most singular anomaly, that "we," the writer, have been able to rub the juice of the poison upon our skin with impunity, having done it repeatedly when a half-grown youngster, from mere bravado.—ED.]

The Kennel.

Muzzling Dogs.—The following we translate from a very thorough article by M. E. Capron, published in *La Chasse Illustrée*. We beg to remark that there is a great deal of false prejudice in regard to French authority on matters appertaining to sporting subjects. It should be remembered that there are no better veterinary surgeons in the world than the French, and that their horses and dogs have wonderfully improved within the last fifty years. M. Capron writes as follows:—

"It has never been proved that muzzles were of the least possible use, for they are rarely if ever made so as to prevent a dog from biting, providing he is mad, while on the other hand the use of the muzzle can so worry and excite the animal in preventing his drinking, or from letting his tongue hang out when he is running, that I am rather inclined to think muzzles predispose a dog to get mad. My advice is, without making it obligatory on the part of the owners of dogs to muzzle their dogs in order to protect the public from danger, that no class at all should be allowed to stray away. It seems to me that those who own dogs, whether for amusement or use, ought to be the most interested in watching them. As it may happen that a dog the best cared for may break loose, a collar should be invariably worn by the dog, having the name of the owner of the dog on it. Any dog without a collar should be taken to the pound, and if not claimed within forty-eight hours should be killed. If the dog should have a collar on the owner should be informed of his capture. If the owner did not call for him I should be in favor of making such owner pay a fine for want of proper care. A measure of this character I am certain would rid the community of a lot of snarling curs which are good for nothing. Everybody has the right to keep a dog, providing the dog does imperil other people's lives."

M. Chevalier, the editor of *La Chasse Illustrée*, adds that the prefect of police in Paris no longer insists on dogs wearing muzzles.

HONORABLE DEALING OF MR. MACDONA.

NEW YORK, July 6th, 1874.

ED. FOREST AND STREAM:—

Will you permit me through your valuable journal to inform my brother sportsmen of the handsome manner in which Mr. Macdonna treated me in regard to the loss of Kirby's whelps. In doing so I am but doing my duty to both the gentlemen himself and the readers of your journal, as it shows them what entire confidence they may place in him.

The circumstances connected with Kirby's whelping when three days at sea, and losing her seven whelps, from the fact that she was too near whelping when shipped, are yet fresh in the minds of your readers and therefore need no recapitulation. It is only necessary to say I wrote to Mr. Macdonna expressing my great disappointment at the loss, blaming him for shipping her when so near whelping, and saying that I thought all things considered he should reduce the price to £25, the original price asked for her before in whelp to Ranger.

After accepting my proposition of reducing the charge

from £50 to £25, he says: "Her loss of whelps is a great loss to you and to the American sportsmen at large; but in a pecuniary sense, it is a greater loss to me, for had I kept her here I could easily have sold all her seven whelps at £25 each, for since I sold her to you she and her progeny's value have been considerably increased by Ranger's extraordinary success at the Shrewsbury field trials last month. She is very valuable on account of her being so nearly related to Ranger, being out of Venus, own sister to Judy, Ranger's dam. I fully sympathize with you in your loss of so large a number of important whelps, and although I am still of the opinion that Kirby, on account of her blood is worth double £50, yet I fully appreciate the fairness of your proposal, that I should accept £25, the original sum named for her before in whelp to Ranger. The only reason I had in sending her as I did, was with the earnest desire that you might have a litter of the best bread setters I could possibly send you, so that you might breed and rear a stock of setters that would reflect credit upon my kennel."

"I am sending out to you by the next Guion steamer my pointer bitch Naylor, liver and white, very valuable as a brood bitch. She is three years old, not perfectly broken, but of great value as a brood bitch. I send also Milo, own brother to Kirby; same litter. He is a grand-looking dog, and will prove a very valuable stud dog. He was the fastest of all my young team of dogs, and showed great nose; but a few days before the trial (Shrewsbury field trial) he was galloping at a great rate and was cramped against by another dog and hurt his foot, which prevented him from being run at the Shrewsbury trial. By the time you receive him he will be all over it. In consideration of the disappointment you have experienced in losing the whelps, I make you a present of Milo and Naylor."

"As soon as I have a good bitch in whelp to Ranger I will forward her to you, as you request."

As your readers are aware, Milo and Naylor have arrived. Milo's foot is well. Your *Field* Editor who is as good a judge of a dog as any man I ever met, has already stated what a fine dog he considers him. Will you permit me space enough to give Milo's correct pedigree, which is as follows:—

Milo, by Don, out of Venus; Venus, own sister to Judy, dam of the great Ranger.

Don.	{ Pilkington's Dash. Lord Downe's Duchess.	{ Laverack's Dash. Laverack's Moll. Burdett's Brougham.
Venus.	{ Rake. Comtess.	{ Ben. Bess. Rake, brother to Hackett's Ned. Hackett's Nell.

Rake, father of Venus, won first prize at the great Birmingham Dog Show, in 1864.

Comment is unnecessary from me, as every reader must see that Mr. Macdonna has done more than could possibly have been expected of him.

In conclusion, I will take this opportunity of requesting those gentlemen who were so ready to bet cigars that "you'll see now he will do nothing about it. I told you to let those English dogs alone," to walk up and pay their bets. They can leave them with the editor-in-chief.

MOHAWK.

Shot Gun and Rifle.

GAME IN SEASON FOR JULY.

Woodcock, *philohela minor*. Squirrels.

Details of pigeon shooting and scores of rifle matches, and other interesting matter, should be mailed so as to reach this office on Tuesday morning in each week.

—Woodcock still scarce in the market, and would readily fetch wholesale one dollar a pair. Some few coming in from Mystic, Conn., and from Henry County, in Illinois. Perhaps they are a trifle scarcer than usual, because country gunners are busy now cutting grass and grain. In about ten days they may be more plenty. Some few dowiches in market, a few curlews, willets, and small snipe. Around and about Point Pleasant, Ocean county, N. J., there may be had a few curlews.

—The advance guard of bay birds, (snipe,) some hundreds in number, were seen last Thursday to cross the Narrows from the New Jersey side to Long Island in two flocks.

—G. H. M. writes from Baltimore, July 11th, "Woodcock are shot here after the 10th of June. I have heard of a few good bags being made; have shot none myself, being entirely opposed to Summer shooting, and hope to see the Spring shooting of all migratory birds prohibited very soon. The prospect for quail in this vicinity was never finer, in my recollection. I never knew of as many pairs of old birds, and the season has been fine."

—A single woodcock is the sum total of this variety of birds yet seen in Pike County, Pa., this season. The late snows of May undoubtedly destroyed the young birds, and probably the old ones. There are certain localities in Pike County which have furnished very good sport in previous years.

—Woodcock shooting was opened in Wisconsin on the 4th, with better success than last year, many good bags being made. The season will be short on account of the drouth.

—A man in Pike County went for woodcock the other day, buckled on his cartridge belt and game bag, tucked his trousers into his boots, took old dog "Sport" along, travelled three miles or more, flushed a fine bird, and when he went to draw a bead on it discovered to his dismay that he had forgotten to bring his gun along! Strange case of absent-mindedness? "Y-a-a-s."

For Forest and Stream.
WOODCOCK IN NEW JERSEY.

NEWTON, SUSSEX COUNTY, July 11th.

EDITOR FOREST AND STREAM:—

I have spent about two weeks whipping the trout streams among the mountains in Wayne and Pike counties, Pennsylvania, where I found an abundance of the "speckled beauties," but generally of a small size. In former years I have fished the Lackawac and Dyberry streams and their tributaries with good success, taking an abundance of trout of fine size and delicious flavor. The streams, however, are preserved by the proprietors, and only a favored few have access to them.

I have travelled, shot and fished in many of the States of the Union, but of all the places I have ever been, this is the most inviting. While driving along these smooth, undulating slate roads, at almost every turn splendid trout streams can be seen winding their serpentine course through the valleys, and then the woodcock swales and the partridge brakes on the hill-sides, from out of which, now and then, at this season of the year, may be seen an old cock-ruffed grouse, majestically crossing the road, with tail spread and crest erect, and from the several flocks of young birds I have met with while woodcock shooting, those old fellows have reason for pride. All these things, with the picturesque beauty of everything surrounding, warms up the blood, and makes me wish that this could be my home for a thousand years. For here, too, besides all the loveliness I have mentioned, may be found good, whole-souled, intelligent, hospitable gentlemen, and skillful field sportsmen at that, and such fine, thorough-bred dogs; but you have been here, and know how it is yourself. I forgot to say that here, too, almost every person is the owner of a Hambletonian, a Bashaw, a Star, an Abdallah, or some other strain of trotters, and besides these, are a few spans of magnificent carriage horses, behind a pair of which, belonging to W. D. Dickson, I have just taken a spin over the Springdale road, and a more lovely drive it would be hard to find. One of them is half brother to Mystic, an extra fine horse owned by Mr. James Northrop, of this place, which horse recently made a second heat in 2:27½. The carriage horses above alluded to are for sale—I think at a very reasonable price for such a splendid pair. With my friend, Theo. Morford, with whom I am at present sojourning, and with our mutual friend "Homo," who, with his family, are spending the Summer here, we are doing our level best in the way of woodcock-shooting; but last Spring, just about the hatching time of this delicious game, an almost unprecedented fall of snow, and several days of extreme cold weather, overwhelmed all this section of the country, and I am astonished to find that even the old birds should have weathered such a storm, for just after the storm, the grounds hereaway were strewn with dead robins, blue-birds, tanagers, warblers, sparrows, &c.; but many an old woodcock, after the loss of their first broods, have, in a commendable and praiseworthy way, brought forth a second brood; yet at least one-half of the woodcock crop was cut off by that snow-storm. Now, more than half the birds we are shooting are old ones, and the young birds we get are generally under size.

"Homo," you know had been extremely ill a short time before the 4th inst. (the opening day of the Summer shooting), but he was convalescent on that day, and determined to have a shoot, if it killed him, and taking into consideration the fact that he had recently been prostrated upon a bed of severe illness, and that woodcock are very scarce, and he shooting with a Parker gun which he had never shot before, he did right well, as he bagged, to his own gun, six pair of very fair woodcock, in part of a morning's shooting.

This reminds me of the woodcock shoot participated in, in the vicinity of Blooming Grove Park, a few seasons ago, when Mr. John C. Westbrook, Mr. John Courson, and Col. Griggs were the shooters. The covert there was so dense, where they were shooting, neither could tell what his companion was shooting at when a report was heard; yet during that day they positively killed about 40 woodcock.

HORACE SMITH.

NEW YORK, July 13th, 1874.

EDITOR FOREST AND STREAM:—

I was sorry to read the rather melancholy account of the woodcock this season in FOREST AND STREAM. I am forced to admit the truth that these fine birds are becoming scarce. However, I had a pretty good morning's sport while home for the Fourth among the low lands and side hills of New London county, just north of the old town of Stonington. The day was very warm, and my dog, although a good one, was nearly used up by noon, and needed all my care to make him attend to business. I hunted pretty hard until 12 o'clock, and succeeded in bagging 11 birds, and taking all things into consideration congratulated myself I did pretty well. I have shot a number of woodcock in that part of the country, and never before have I seen the birds "start" so hard or act so mean. Yours respectfully,

Some of our friends in the vicinity of Cape May, N. J., have made very fine bunches of woodcock within the past week.—ED.

PORTLAND, Me., July 9th, 1874.

EDITOR FOREST AND STREAM:—

A few words with regard to the opening of the woodcock season in this vicinity may not come amiss to some of your readers, and it is only to be wished that the report could be more favorable. July 4th, on which day the season began, was a foggy day, followed by 24 hours' hard rain, which, in connection with previous wet weather, has filled the lower covers and scattered the birds along the uplands, as a natural consequence of which no large bags have been reported, with perhaps one exception. The promise of ruffed grouse (local partridge) for September 1st is, however, very good, as the "woods are full of them." I have received information from many portions of Maine and New Hampshire, all of which mention large broods.

—The Grand Pigeon Shooting Tournament came off at Detroit, Michigan, on July 7, 8, 9, and 10. The shooting was open to all amateurs, and to be governed by the Michigan State medal rules. Plunge traps, 1½ oz. shot. The amount of money prizes was \$1,000, and the entrance fee, \$10. The committee of management comprised the following gentlemen: W. C. Colburn, John E. Long, the celebrated gun-maker of Detroit, Elam Fisher, J. V. D. Eldridge, and E. H. Gillman. The tournament was one of the most successfully conducted affairs that ever came off in the State of Michigan. The weather was delightful, the birds were wild pigeons, fat and fast flyers. The following gentlemen were the winners:

First day, Tuesday, July 7th, 1874, ten single birds—1st

prize, \$125, Long; 2d prize, \$75, Sherman; 3d prize, \$50, Hascall; 4th prize, \$30, Hawkins; 5th prize, \$25, Lee; 6th prize, \$20, Hall; 7th prize, \$15, Hamilton.

Second day, Wednesday, July 8th, 1874, ten single birds—1st prize, \$100, Hall and Cristy, divided; 2d prize, \$75, Smith; 3d prize, \$50, Caldwell; 4th prize, \$30, Colburn; 5th prize, \$25, McJanas; 6th prize, \$20, Luckett; 7th prize, \$15, Hawley.

Third day, Thursday, July 9th, 1874, ten single birds—1st prize, \$125, Dubois; 2d prize, \$75, J. J. Hall; 3d prize, \$50, W. Hall; 4th prize, \$40, L. Moran; 5th prize, \$30, L. Horne; 6th prize, \$20, Pinckney; 7th prize, \$10, Cadman.

We shall endeavor to publish next week, if possible, the details of birds killed, &c.; of the above tournament.

LEXINGTON, Ky., July 10, 1874.

EDITOR FOREST AND STREAM:—

The shooting tournament gotten up under the auspices of the Hunter's Club of Lexington, Kentucky, took place near the city July 7th, 8th, and 9th, of which I send you the following report. The first day the judges were Dr. William Pryor, of Franklin county, Ky.; Hon. George Fleming, of Fleming; and George Bowen, of Bourbon. The first match was a side shoot at four pairs of birds, 18 yards rise, 100 yards boundary, 1½ oz. shot, five entries:—

	Straight.	Killed.
M. A. Kenney, Bourbon county, Ky.....	2 pairs.	6
S. W. Bagg, Bourbon county, Ky.....	1	5
R. H. Hicks, Woodford county, Ky.....	1	5
R. F. Sandusky, Lexington, Ky.....	0	2
Rodenburg, Lexington, Ky.....	1	4

The second and grand match of the occasion was at five pairs of birds, 18 yards rise, 100 yards boundary, 1½ oz. shot; seventeen entries; free for all:—

	Straight.	Killed.
T. N. Martin, Lexington, Ky.....	1	6
J. W. Kidd, Lexington, Ky.....	1	7
H. G. Craig, Lexington, Ky.....	1	6
A. Jeffrey, Lexington, Ky.....	1	5
T. J. South, Franklin county, Ky.....	3 pairs.	8
R. Church, Franklin county, Ky.....	4 pairs.	9
L. C. South, Franklin county, Ky.....	5 pairs.	10
C. A. Kenney, Bourbon county, Ky.....	5 pairs.	10
W. F. Champ, Bourbon county, Ky.....	3 pairs.	8
L. Trotter, Bourbon county, Ky.....	4 pairs.	9
J. H. Kerr, Bourbon county, Ky.....	2 pairs.	7
J. Cunningham, Bourbon county, Ky.....	2 pairs.	8
J. W. Ferguson, Bourbon county, Ky.....	1	7
J. Anderson, Jessamine county, Ky.....	2 pairs.	5
R. Smith, Scott county, Ky.....	1	6
T. H. Arnold, Woodford county, Ky.....	1	4
Tom Mannen, Mason county, Ky.....	4 pairs.	9

C. A. Kenney and L. C. South divided first money. Ties for second money shot off by Mannen, 00-0; Trotter, 10 10 10-3; Church, 10 10 11-4; who received second money.

Ties for entrance—Champ, 11 11 11-6; Cunningham, 10-1; South, 11 11 10-5.

Second day—First match—Nursery stakes, at three pairs of birds, 18 yards rise, 100 yards boundary; ten entries:—

	Straight.	Killed.
Colonel Frank Waters.....	2 pairs.	5
Colonel W. R. Fleming.....	3 pairs.	6
Wm. Dudley.....	3 pairs.	5
Captain Phil Kidd.....	0	3
Captain Joe Wollner.....	2 pairs.	withd'w.
S. Sharp.....	2 pairs.	5
Wm. McCaw.....	3 pairs.	6
L. E. Tarlton.....	0	6
H. G. Craig.....	1	3
T. L. Bryan.....	1	3

Ties shot off—Colonel Fleming, 11-2; Wm. McCaw, 10-1.

Second match was six pairs of birds, 18 yards rise, 100 boundary, 1½ oz. shot; \$5 entrance; two thirds to first man, one third to second man, and third to save entrance:—

	Straight.	Killed.
T. J. South.....	5 pairs.	11
L. C. South.....	4 pairs.	10
R. Church.....	2 pairs.	withd'w.
L. Trotter.....	5 pairs.	11
J. H. Kerr.....	3 pairs.	11
T. H. Mannen.....	2 pairs.	12
June Smith.....	6 pairs.	12
Colonel F. Waters.....	3 pairs.	9
Dr. Dudley.....	3 pairs.	10
C. A. Kenney.....	2 pairs.	withd'w.
R. T. Holloway.....	3 pairs.	8
J. T. Kidd.....	3 pairs.	9
H. G. Craig.....	1	6

First money went to Smith, he killing six pairs in succession.

Ties for second money shot off by T. J. South, 11 00-2; J. H. Kerr, 11 10-3; L. Trotter, 11 11-4; won.

Ties for third money, or entrance fee—Dr. Dudley, 11 10-3; L. C. South, 11 10-4; won; T. H. Mannen, 11 00-2.

Third day—First match was at three pairs of birds, eleven entries, \$5 each, \$20 added by the club; \$50 to first, \$30 to second, and third to save entrance:—

	Straight.	Killed.
William McCaw.....	3 pairs.	6
William Kemp.....	2 pairs.	4
June Smith.....	3 pairs.	4
L. E. Tarlton.....	1	1
R. Church.....	5	5
F. Waters.....	2	2
William Ferguson.....	2 pairs.	5
J. W. Kidd.....	3 pairs.	6
T. C. Woodford.....	3 pairs.	6
T. J. South.....	2 pairs.	5
L. Trotter.....	3 pairs.	6
L. C. South.....	4	4

Ties for first money—Woodford, 11 11-4; Kidd, 00 10-1; McCaw, 11 10-3. South won second money, 4 to 2.

Second match between Trotter and South; \$50 a side:—

Trotter.....	11 11 10 01 11 11 11-14
South.....	11 11 01 11 11 11 11-15

Third match was a challenge from Hunter's Club to Nimrod Club of Bourbon; four pairs birds; four men each; loser to pay for birds:—

HUNTER'S CLUB.	Killed.	NIMROD CLUB.	Killed.
Craig.....	2 pairs.	Kerr.....	3 pairs.
Viley.....	5	Woodford.....	3 pairs.
Woodfolk.....	4 pairs.	Kidd.....	3 pairs.
Waters.....	4	Ferguson.....	6
Total.....	22	Total.....	38

Yours, C. A. KENNY.

CHICAGO, July 4th, 1874.

EDITOR FOREST AND STREAM:—

The following is the result of a pop at tame birds at Charles Reese's Hyde Park, July 4th:—

SINGLE.	DOUBLE.
Underwood (10 straight).....	13 William Chittenden (13 straight).....
Chas. Creighton (3 straight) withd'w.	
SINGLES.	THREE PAIRS.
Wm. Chittenden (4 straight p's).....	15 Underwood.....
Chas. Creighton (4 straight p's).....	14
Carson.....	1 1 1-3 Underwood.....
Wright.....	0 0 1-1

William Chittenden..... 11 11 10-5
CHIT.

—The first pigeon tournament of the Cincinnati Shooting and Fishing Club will be held at Cincinnati, Ohio, on July 21, 22, 23, and 24, open to all amateurs; professionals

barred. The prizes will amount to \$1,000. All shooting to be governed by the club's rules.

—The pigeon match between Messrs. James Gordon Bennett and George Lorillard, took place on the 9th, at Islip. Both the gentlemen used Wesley Richard's breech loaders. English rules, thirty yards, 100 birds. Mr. Lorillard killed 52 birds, Mr. Bennett 49. Which was the better shot was hard to decide. Mr. Bennett seemed to be the more unlucky, many of his dead birds falling out of bounds.

TIFFIN, Ohio, July 8th, 1874.

EDITOR FOREST AND STREAM:—

An association, called "The Ohio Association for the Protection of Game," was organized here last winter, having for an object the protection of game and proper enforcement of the game laws of the State.

The Association also offers protection to the rights of the farmer, by offering rewards for proof which may lead to the conviction of anybody who has been guilty of doing damage to farm property or having in any way trespassed on farmer's right contrary to law.

This society celebrated the Fourth by holding their First Annual Pic Nic and Pigeon Shoot. The pic nic was a most enjoyable affair, and the pigeon shoot showed considerable skill on the part of the older and more practiced shooters, and must have been quite satisfactory to those amateurs who never "shot on the wing" before this day. Below you will find the score. Fourteen single birds each, plunge traps, 21 yards rise, boundary, 60 yards, 1½ oz. shot:—

Name.	Killed.	Name.	Killed.

Baldwin.....	9	Gibson.....	10
Sexton.....	9	Kaul.....	6
Vedder.....	11	Frost.....	7
Total.....	75	Total.....	73

Yours truly, DERBY.

—Among the first sixty qualified at Wimbledon to shoot for the Queen's prize, are the following Canadians: Lieut. Whitman, of Quebec; Private T. Mitchell, of Ontario; Capt. J. P. McPherson, of the Governor-General's Foot Guard; Color Sergt. Baillie, of Ontario; Major Gibson, of Ontario, and Hancock. All of these riflemen are entitled to a prize of £12, and to wear the National Rifle Association badge. Sergt. Vail was the only Canadian who got into the second stage last year.

In the contest for the Alexandra prize, the following have been returned winners: Capt. Layton, Nova Scotia; Capt. McPherson; Lieut. MacNaughton, Cobourg Artillery, Ontario; Private Disher, Ontario, and Capt. Morgan, Quebec.

CREEDMOOR.—THE AMATEUR CLUB BADGE AND THE REMINGTON DIAMOND BADGE.—Both these events came off punctually as to time, on Saturday last, it being the fourth competition for the Amateur badge and the third for the Remington. The weather, though hot and close, without being exactly unfavorable, the sun being at times partially obscured, allowed good shooting. The wind was rather puffy. The Amateur badge, distances 800, 900, and 1,000 yards, five scoring shots, two sighting shots, came off at 11 o'clock.

Name.	Score.	Total.

A. V. Travis.....	0 0 0 3 3 6

SCORE AT 900 YARDS.

In analyzing the scores made, we note the very excellent shooting of Messrs. Yale, Bodine, Ballard, and Canfield, at 800 yards—all these having made 19 in a possible 20. At 900, General Dakin came to the front with 17 in a possible 20, making up for a somewhat lower score at 800 yards. At 1,000 yards, the 15 secured by General Dakin and Mr. Yale is excellent shooting, an average of 3, being so far considered fine shooting at this long range. In awarding General Dakin the badge, Mr. Yale having made the same total, 48, the prize was given under the rule of ties, to the highest score at the second range. The following is a resume of the two scores:

Name.	800 yds.	900 yds.	1000 yds.	Total.
General Dakin.....	16	17	15	48
G. W. Yale.....	19	14	15	48

The average of the shooting of the two best shots was three-fifteenths better than a centre for every shot. By the new rule, allowing the best twelve to compute, Messrs. Richards, Tregessin and Davison were excluded, but as may

be seen, there was a power of reserve in one of the excluded ones which rallied with the urgency of the occasion.

At 3:30 the Remington diamond badge was shot for, there being numerous entries. Distances, 500, 800, and 1,000 yards, seven shots, two scoring shots.

Name.	Score.	Total.

Mr. Richards, an admirable shot, both scientific and practical, made the handsome score of 71, and took the coveted Remington diamond badge. Mr. Edmond Stone the Whitworth rifle. His first score of 28, every shot a bull's eye, making all he could, cannot be surpassed. At 1,000 yards an unfortunate duck egg appears, but it is redeemed by the general excellence of the entire score, 71 in a possible 84, or an average of almost a 3½ at every shot, which is almost, if not quite, up to the Irish shooting. The following recapitulation of the shooting for the Amateur long range badge, and the Remington diamond badge, may be of interest.

Name.	500 yds.	800 yds.	1000 yds.	Total
1st match—L. J. Hepburn.....	14	17	15	46
2d match—J. S. Conlin.....	16	12	17	45
3d match—John Bodine.....	18	12	15	45
4th match—General Dakin.....	19	14	15	48

*July 11th, 1874.

Name.	500 yds.	800 yds.	1000 yds.	Total
1st match—J. Omand.....	23	25	22	70
2d match—J. Bodine.....	25	24	20	69
3d match—J. P. M. Richards.....	28	21	22	71

*July 11th, 1874.

It will be observed, then, we trust, with great satisfaction, that the scores made at the last two matches, were the highest. A little more work, then, gentlemen of the N. R. A., and we shall hold our own with the Irish team.

We notice with pleasure the presence of General Hawley at the Range, shooting in the pluckiest way through the Amateur match. The General handles both politics and the rifle with a great deal of skill. If there is a Press match this Fall, as we hope there will be, we think the General is bound to win it.

—The Twenty-Eighth battalion, fifth brigade, second division (we are thus careful to particularize this organization), met at Creedmoor on Monday last, the 13th, and we regret to state they behaved in a most discreditable way. The first accident at the range occurred on this occasion, Barton, a marker, having been dangerously wounded; whose fault it is we are not yet prepared to state. The conduct of the majority of the men was disgraceful to a degree. We regret to state that this is the second or third time the Brooklyn regiments have misbehaved. Both on the range, and on coming home, their conduct was such as to throw no credit on either the regiment or the officers in command. If possible, we trust the range will not be given over to this regiment again until they know better how to behave themselves. Their nationality has nothing to do with it. Our remarks would be equally scathing were they English, Scotch, Irish, or Germans. The following are the ten best scores:

Name.	200 Yards.	Total.	500 Yards.	Total.	Grand Total.
Lieutenant Trezz, Co. A.....	4 4 0 2 4	14	4 3 2 2 4	15	29
Captain Heinrichs, Co. C.....	3 3 0 3 4	13	4 3 2 4 2	16	29
Captain Schweitzer, Co. G.....	3 3 3 3 2	14	0 3 0 3 2	8	22

Sergeant Rude.....	0 0 3 3 2	8	2 2 2 4 2	12	20
Captain Broer, Co. F.....	3 3 2 3 3	14	0 0 2 2 2	6	20

—The Ninth Regiment held a preliminary meeting last week for the purpose of organizing an association for rifle practice. Quite a number of the members signified their intention of founding an organization for the purpose of proper practice in rifle shooting. Lieut. Col. Hitchcock is in earnest in his endeavors, of making the regiment, by means of systematic training, to be among the leading rifle regiments in the State.

—We call particular attention to the following notice issued by the Amateur Rifle Club, which explains the methods to be employed for the selection of representative American riflemen, who are to shoot with the Irish team:

IRISH-AMERICAN CONTEST.—Notice is hereby given that six competitions will be held at Creedmoor, on the following days, viz: July 15, 18, 22, 29, and August 1 and 5, at eleven o'clock, A., for the purpose of selecting a team to practice for the Irish-American contest, which competition will be held under the following conditions:

Open to all natives of the United States; rifle, any of American manufacture, and within the rules of the club; position, any, without artificial rest; distances 800, 900 and 1000 yards; rounds, fifteen at 800 and 900, twenty at 1,000 yards. No sighting shots. The twelve making the highest aggregate scores in any four of the six competitions to be selected to form the team and reserve. Three markers will be provided two days in each week for the exclusive use of those selected as above, and each man will also be furnished with 100 rounds of ammunition per week. Further arrangements are also being made to facilitate their practice, and render it as little expensive as possible. For this reason all persons entering these competitions will be required to pledge themselves that should they be successful competitors, they will practice as far as possible in such places and at such times as may be directed by the Executive Committee, and do all in their power to qualify for the match. The members of the club will also take notice that in future competitions for the Long Range Badge, the number of competitors authorized to shoot at 1,000 yards, by virtue of making the highest aggregate scores at 800 and 900 yards, will be twelve, instead of eight, as heretofore. Also, that the fifth competition for the Long Range Badge, will be held Saturday, July 25th, at 11 A. M.

The members of the Club are earnestly requested to co-operate with the Committee in their endeavors to produce a team worthy of representing America in September next. Our opponents, already tried and experienced marksmen, are receiving in numerous ways the support and encouragement of their countrymen, and it will be absolutely necessary for the A. R. C. to make a vigorous effort to create a similar interest in the forthcoming contest among our own countrymen, if we would meet them on anything like even terms.

It will devolve upon the club to provide means for the training of the team, the carrying on of the match, and the proper reception of our guests, and to this end it is desirable that each individual member should exert himself in any way in which he can make his influence available, and particularly in the matter of raising funds. The day named for the contest is Saturday, September 26, 1874. Entries for the above matches may be made on the ground, or at the Secretary's office. By order of the Executive Committee. Fred. P. Fairbanks, Secretary, 194 Broadway.

—The following rules in regard to "coaching" in rifle shooting have just been adopted at Creedmoor:

No person except the register keeper shall be permitted to speak to a competitor after he has taken his place at the firing-point, or to afford him any information which may be calculated to assist or confirm his judgment as to firing.

Any violation of this rule shall be at once reported by the register-keeper to the officer in charge, who shall caution the offender, and on any repetition of the offence, shall report the same to the Executive Committee, who will cancel the score of the competitor, and will remove the person advising him from the ground.

—We regret to state, that in consequence of the necessary practice for the Irish match, and other regular days on the cards at Creedmoor, it looks as if the "simultaneous match" with our Canadian friends would be adjourned *sine die*.

—In France, for the year 1873, *La Chasse Illustrée* informs us, that 375,743 licenses to shoot were taken out, producing the large sum of 5,636,145 francs.

—G. E. C.'s letter on pistol practice, with target, will appear in our next. Crowded over.

—The opening festival of the Newark Schutzen corps took place last week.

—To-day, July 16th, the Comet is at its brightest.

Answers To Correspondents.

C. & S., Baltimore.—Price of Roosevelt's "Superior Fishing" is \$2.50. J. H. W., Fort Wayne, Ind.—How late can I take trout in the Neepigon? Ans. Until frost comes. Take the last steamboat back in Oct.

ILLINOISAN.—What is the name of the common sucker? Ans. *Catostomus communis*—De Kay.

READER.—Will you please name some preparation and where to purchase the same, that will keep mosquitoes and black flies from annoying a person while fishing? Ans. Tar and sweet oil; at druggists.

G. S. H., Boston.—The fish you refer to are the sea bass, or rock bass very black, large scales, large fins and great mouth. Fish with hand, line on reefs, wrecks, or ledges, and use clams for bait.

E. C. S., Schenectady.—Please mention the best color for trout leaders, and give receipt for dyeing the same? Ans. Soak in decoction of tea, coffee, or indigo for several hours. We prefer the tea.

S. T. O., Akron, Ohio.—Creedmoor is on Long Island, some 13 miles from New York. We send you paper with full particulars. The team for the Irish match is not yet made up. See issue of to-day.

BUFFALO BILL, Newark, N. J.—Please let me know through your paper the best work on hunting and trapping and tanning furs? Ans. Newhouse's "Trapper's Guide," 142 Grand street, Mason, Baker & Pratt.

H. L., New York.—Can you inform me of the best place to get small trout to stock a pond, and also what they are worth to buy; the pond being on Long Island? Ans. W. H. Furman, Maspeth, or Mr. Hines, Patchogue, Long Island. Usual price about \$40 per thousand.

L. G. B., New York.—What were the objections for not publishing the score of the Deerfoot Shooting Club of South Brooklyn, shot on the 1st of June last? Ans. No objections whatever. Crowded out, perhaps overlooked, mislaid, or overtaken by some one of the occasional mishaps that inevitably occur in a newspaper office.

ANGLER, Westchester, Pa.—Is there such an article for fishermen as water-proof stockings, or overalls, which could be worn over other clothing and keep it dry; if so, state where they can be purchased and the price? Ans. D. Hodsman & Co., corner Maiden lane and Nassau street, can supply you; price \$6.50. Send size of foot.

H. S. SINCLAIR, Chelsea, Mass.—Would not advise you to venture into the Adirondack wilds without a guide, although you can go to any of the sporting houses and hotels, and making these your headquarters, get good hunting and fishing within hailing distance. The best map is Ely's, at Colton & Co.'s, 172 William street, N. Y.

H. R. M., Marquette, Mich.—Can you inform me if gauntlet gloves,

leather backs, with cloth fronts, are made and for sale anywhere; if so, please inform me where. I want them as a protection against flies and mosquitoes. The gauntlet, or wrist, must also be of leather and come well up under the sleeve? Ans. Have sent your order to C. Field, 735 Broadway.

A. F., Brooklyn.—To what part of the Adirondacks would you advise me to go for good fishing, where the trout average a fair size; a spot that can be reached in not over two days' journey from N. Y.? What of the Mountain Lake? How do you get there? Ans. Take Adirondack Railroad from Saratoga to North Creek Station, and thence stage to Blue Mountain Lake. No better place in Adirondacks accessible in two days.

H. E. C., Malone, N. Y.—What is the best method of breaking a setter pup, and what work on dog culture should I get? Ans. Stonehenge's "Shot Gun and Rifle" will give you the desired information. Cannot a setter become a good retriever by proper handling? Ans. Yes; being an educated spaniel, it is one of the first distinctive features in the animal.

C., Oswego, N. Y.—I have a setter pup eight months old. He has had the distemper for nearly three months, though latterly it is only noticed by a slight discharge at the left nostril; he is in good health. Can you inform me what would be advisable to give him, or will it gradually wear out? Ans. You have been very fortunate so far, and therefore let nature have her own way.

G. E. R., Maplewood, Mass.—Can you tell me whether or not it is necessary in putting goldfish into a pond to breed to have dark colored ones with the red ones? Ans. The red, black and mottled goldfish are all of the same variety, differing only in their markings. Cannot understand why your fish don't breed. For goldfish culture see FOREST AND STREAM, vol. II, pages 39, 215, 246.

C. F. S., Rochester, N. Y.—Will U. S. "shinplasters" pass among the natives of the Muskoka region? 21. If a party were to go there in July or August, would it be advisable to carry a gun? Ans. Better exchange your U. S. currency for Canadian at Toronto. Take a good supply of silver change. Take a gun for protection against bears and other varmints. There is no game in season in Ontario until the 1st of Sept.

J. E. S., Sussex Corner, Canada.—Would try first to wrap my conical ball with a fold or more of bank note tissue paper, so as to force it a little. It is not probable, unless after immense usage, that the grooves are entirely obliterated. If new grooves had to be cut it would cost in the States some \$8. If we knew the exact calibre, could give you fuller information. Write again.

J. W., Philadelphia.—I have a 10-bore, Scott gun, chamber, 2½ inches long. Ought the shell used be 2½ inch regardless of load? For instance: if I use 4 drachms of powder and 1½ oz. of shot, should the shell be the same size as if I used 3 drachms and 1½ oz. and so on. Of course I mean in length only. What grain of Dupont's powder is No. 6 Currys & Harvey equal to? Ans. 1st. To accomplish the best shooting your shells should be 2½ inches long, so that they reach up to the beginning of the taper in the gun. Do not cut them off at the top. Use Hall's patent creaser. 2d. About 5 of Dupont's.

CENTRAL CITY.—It appears to us that our system of printing scores of pigeon matches is very simple to understand. Take as an illustration Mr. Dexter's shooting—in the 2d squad—at the Illinois Tournament, to which you refer. Dexter positively killed 9 birds out of the five double rises, yet only killed two pairs in succession "straight" thus, 11 11 01 11 11. In Abbey's score was a typographical error. It should have been 5. Our reasons for not giving all the figures of pigeon shooting in full is simply because we must save as much space as possible, and in using the words "straight" and "killed" it gives sportsmen all the desired information.

H. P. M., Nassau, N. H.—I have a pointer pup, one year old, out of an imp. bitch by a full-blooded setter, has an excellent nose, under good command, and stands well; received him late last winter, and have not been able to test his field qualities. He shows no evidence of his setter blood. Is it worth my while to train and keep him? Ans. As you seem to speak so highly of his qualities, train him carefully. "Droppers," when they are good, show fine, staunch qualities, but do not breed from them. 2d. Would it impair the shooting qualities of a 10-bore, 30-inch, breech loader to reduce it to 28 inch? Ans. Certainly not.

D., Boston.—A starts game; is pursuing with a reasonable chance of bagging. B intercepts and captures, not knowing that A is in chase. In honor who should have the prize? Ans. We have seen many instances of this kind in the field. In sportsman's etiquette, if the game be a bird in honor it belongs to B, because B has not only pursued it, but shot it. If an animal, in honor it should be divided, because the start of any game animal is half the battle. 2d. B has knowledge of A being in pursuit and captures. Who in honor should have the prize? Ans. This is an unsportsmanlike action; as far as honor is concerned there is no fair play in it, but we should give the prize to B. These questions are answered upon points of field etiquette, and not from points of law. We should like to receive some other practical opinion on this matter.

C. P. W., Albany.—In trouting on wilderness lakes we often want a light, portable and foldable boat, or raft, capable of holding three persons, and if possible of not exceeding 30 to 40 pounds weight, as it must be carried in. Can you inform me what I can get that will answer this purpose? Mr. Prime, in his "I Go a Fishing," speaks of an India-rubber raft. Do you know what it is, and where procurable? Ans. See this day's paper for our opinion of Heeman's canvas boat. We know of none that will answer the purpose better. The raft that Prime speaks of was first exhibited some ten years ago. We examined it. It is composed of parallel rubber tubes to be inflated when required, with a skeleton platform, or seat, on which the angler sits. It is an admirable fishing raft, but scarcely a boat; still it would carry a heavy load. Does any one know where this raft can be seen?

R. S. NEWCOMB, Salem, Mass.—Please inform me what a "Whitehall boat" is, their origin and use, and also if you think a yawl boat, 17 feet in length, cat-rigged, and mast set up with staves, used exclusively for sailing, has a right to the title? Ans. A Whitehall boat does not answer in any respect the description given above. It is a carvel-built boat (smooth, not lapstreak), generally 17 feet in length, though sometimes 19 and 21 feet, and has a moveable mast with sprit sail. It can be sailed or rowed equally well, and with a breeze can be managed without oars or rudder, the boatman steering her by simply shifting his position, fore, aft, or amidships, according as he wishes to luff, keep her off, or hold her on her course. This kind of boat originated with the fishermen of Fulton Market, New York, about forty years ago.

JOCELINE.—In what locality within 100 miles of Boston can the best woodcock shooting be had? Ans. There is some obscurity in the question; if limited to this season we should say enough has not transpired to warrant a decent day's sport within the specified bound. In some localities small bags have been made thus far, in others none at all. When the biggest bags were made on the 4th, by the 27th the smallest will follow. The birds so change their habitat on account of food or fancy, that no general decision can be given to a novice, and unless one is familiar with the country and cover it is idle for him to expect a good day's sport. In order to get a decent day's shooting, at any season, one must fraternize with some one familiar with the haunts of the birds in each locality. On the 4th, in Worcester county, a friend bagged 13 woodcock; on the 9th, beating all day over some of the best cover in Essex county, with the mercury at 90 degrees, he did not raise a bird! Ten days hence birds may be plenty in Essex county and scarce in Worcester. Next year everything may be reversed. Birds may be plenty along the sea coast and but few inland. They may be abundant in either or neither. In some seasons the fall flight is along the sea board, while in others it almost entirely inland. Sorry to disappoint "Joceline," but the love of truth, inherent in every gunner's breast, compels the above statement.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INDOOR RECREATION OF MEN AND WOMEN OF A HEALTHY INTEREST IN OUT DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company,

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,
[Post Office Box 2832.]
and 125 SOUTH THIRD STREET, PHILADELPHIA.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty per cent. for five copies and upwards. Any person sending us two subscriptions and Ten Dollars will receive a copy of Hallock's "FISHING TOURIST," postage free.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, JULY 16, 1874.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Managing Editor.

WILLIAM C. HARRIS, Business Manager.

CALENDAR OF EVENTS FOR THE CURRENT WEEK.

THURSDAY, July 16th.—Monmouth Park, Long Branch, N. J.—Mystic Park trotting, Boston—Catskill Driving Park—College regatta at Saratoga—New Dominion R. C. regatta, Toronto.

FRIDAY, July 17th.—Trotting, Mystic Park, Boston.

SATURDAY, July 18th.—Racing at Monmouth Park, Long Branch, N. J.—Dorchester Yacht review at Boston, and annual cruise, to continue several days.

TUESDAY, July 21st.—Beacon Park trotting, Boston, Mass.—Dexter Park Association, Chicago.

WEDNESDAY, July 22d.—Annual regatta, Northwest Boating Association, Toledo, July 22d, 23d—Brooklyn Yacht Club cruise begins, to continue eight days—Trotting at Beacon Park—Dexter Park Association, Chicago—Eric Driving Park Association, July 22d, 23d, 24th—Harrodsburg, Ky., Trotting Association, lasting three days.

WHO INVENTED CROQUET?

THIS question has been repeatedly asked and never answered authoritatively, and the probability is that it has been gradually developed from some rude and simple beginning. It was brought to this country from England, where it, without doubt, originated, although many have tried to prove a French origin from the name. It has been asserted that the game has grown from the old game of Pall Mall, in which a ball was driven through an arch or wicket, the strength of the stroke being the chief point of excellence, and that same idea seems to have been retained by many players of croquet who have only the one object of knocking every ball as far as possible. When croquet was first introduced into this country, the nature of the implements and the rules of the game rendered it a crude affair, compared to the game as at present enjoyed in our beautiful lawns by expert players.

Since its first appearance croquet has achieved an astonishing degree of popularity, and while even many admirers of the game have predicted its early decline, because of its immense popularity, it has gone on increasing from year to year, and the manufacturers state that a larger number of sets have been sold this season thus far than ever before.

The love of gain and the idea that croquet would soon play itself out, has induced many to exercise their ingenuity in the invention of something new to take its place, and of which they could control the manufacture, but thus far all such efforts have seemed futile, for while year after year these novelties have been announced, they have one after another been forgotten, and still the old game has not only increased in the large cities and villages, but the white wickets and gaily painted balls and stakes dot the

lawns throughout the rural districts. Each succeeding year tends to popularize this truly social game, because any novelty, in order to supersede this favorite, must be very much superior to it. All croquet players will well remember how difficult it was in the early days of the game to get a company of players without taking some beginners, who, of necessity were a hindrance to the sport, and will see how different it is now, when a company of comparatively good players can almost always be made up from any social gathering. Necessarily any new game is subject to the same difficulties experienced with croquet in its early years, and the added disadvantage of a well-known and popular game to compete with which croquet did not have. Hence while those who are blessed with ample room and funds for both, may enjoy the novelties for variety, the old game will remain the standard.

The great number of miserable apologies for croquet implements that are offered in the trade this season has impressed many casual observers with the idea that this class of work is superceding the better sets, but we believe that this is not the case, and that while the sale of such implements would seem to be detrimental to the interests of the game, yet, (no thanks to the manufacturers of such stuff,) it will work to its advantage and more universal introduction. The sale of this trash is mostly to those who have never enjoyed the game, and it will serve to give them so much knowledge of it that another season, or perhaps before the end of the first, they will be ready to invest a reasonable amount in a good serviceable set of implements that will afford them some pleasure.

THE UNITED STATES FISH COMMISSION.

FLASHES FROM THE "BLUELIGHT."

THE United States Fish Commission, which last season devoted itself to the hidden mysteries of Casco Bay, in Maine, this year has dropped farther south, and with headquarters at Noank, Connecticut, will investigate the habits and customs of the odd fish and curious creatures which find their homes in the waters of Long Island, Fisher's Island and Block Island Sound, with an occasional foray perhaps, when clear weather permits, on to some of the banks, an hundred fathoms deep, to the southward.

Several of the party, including Professors Baird and Verrill, have been on the ground for a week, and have improved the time by investigating between tides, the numerous animals living on the shores, on the piles of the wharves, and among the eel-grass in the harbor. They have already secured about 200 different species. Among these there are fifteen or twenty not before found on the southern coast of New England, and several that are quite new and undescribed. Among the more interesting kinds are *Balanoglossus aurantiacus*, a rare and curious worm, with a remarkably large proboscis; and *Arenicola marina*, a large annelid not before found south of Cape Cod.

The favorite little Government steamer "BLUELIGHT," in charge of our long-time correspondent "Piseco," has again been placed at the disposal of the Fish Commission, so that we are enabled to promise our readers a weekly record of its scientific investigations and discoveries, to be printed in this paper as the official organ of the American Fish Culturists' Association. The first instalment is now on hand, but must be deferred until next issue, when it will be printed consecutively with the second. All the professors comprising the corps of observation will furnish notes for these weekly papers, and consequently the FOREST AND STREAM will be looked for with increased interest. We shall print engravings of the most noteworthy "finds," as they are termed.

For Forest and Stream.

THE NATIONAL CONVENTION.

HANNIBAL, Mo., July 10, 1874.

EDITOR FOREST AND STREAM:—

THE call for a National Convention made at Oswego by the New York State Association for the Protection of Game, is a step in the right direction. At the same time it is to be feared that it may defeat the very object for which it was probably intended, as all are left to arrive at their own conclusions as to the purpose for which it was called. It is very much to be regretted that the meeting did not adopt the circular letter issued by the New York City Association, recently published in the FOREST AND STREAM, for that distinctly states the purpose for which the call is made, and lays it before the sportsmen of the country for their consideration and discussion, both as to the feasibility of plan and to decide when and where the meeting should be held. The subject is one of national importance, and requires to be carefully considered, and when action is taken, it should be a concerted one. While no one would be likely to question the good intention of the gentlemen who issued the call and named time and place, it would seem to some that they had volunteered to undertake the carrying out of a great work without sufficiently consulting the sportsmen outside of the State of New York, for it is an undertaking which, to succeed, must have the united support of the sportsmen throughout the country.

It would be in about as good taste for one of the New York clubs to hold a meeting, and decide to hold a State meeting, name time and place, and then invite the rest of the clubs in the State to attend, as for the sportsmen of any one State to issue such a call without conference with the sportsmen outside of the State. Supposing the Illinois State Association had issued such a call, the meeting to be held in Chicago ninety days after the call was made, how much attention would the sportsmen of New York have paid to it, even though they were interested in the results. The State of New York is large, and contains many wealthy and influential sportsmen, but it doesn't contain a majority of the sportsmen of this Union, and when they assume to dictate a national matter, it is very reasonable to suppose

that there will not be the harmony and unity of purpose that is so much to be desired in an undertaking of this kind. It must take time to work up a matter of such magnitude. Had the New York circular been adopted, it would have put the matter in good shape before the country. The time and place would have been discussed in a friendly manner, time would have been given the different States to have prepared for the meeting, the time would very likely have been put off until shortly before the assembling of Congress and the different Legislatures, and very likely Cincinnati or Louisville, or some more central location, would have been chosen, and the delegates would have gone fully prepared for the duties required of them; they would have known whether they were going to witness the butchery of a hundred thousand pigeons, and to discuss the merits of some new trap, or were going for the purpose of assisting to frame laws for the protection of game and fish, which would afford the best protection and obtain the greatest conformity as to open and close seasons in the various States of the country; for, as the State laws now are in various instances, an imaginary line makes a difference of fifteen days in the open and close seasons.

Hoping that the matter may be fully discussed through the medium of the press, and in the event that the present call does not meet the wishes of the majority, that the call be withdrawn, and let the sportsmen at large decide on time and place. If the call was only intended to obtain an expression of the feelings of the sportsmen of the country, it will serve a very good purpose.

G. W. D.

Has our Missouri correspondent overlooked the fact that there are now two calls before the country for a National Convention to revise the game laws—one emanating from the New York State Association, and the other from the New York City Society for the Protection of Game, signed by Royal Phelps, Esq., President, and Hon. Robert B. Roosevelt, Vice President, and printed in this paper on the 24th of June just past?—Ed.

A GHASTLY GIFT.—We of the *Forest and Stream* have gotten on prosperously and contentedly so far, but now we are likely to have "a skeleton" in our house, as every other house is said to have. "Coming events," they say, "cast their shadows before," and unless the skeleton referred to in the subjoined letter is too thin to cast very much of a shadow, we shall soon expect the Major's ghost of a promise to become a realized fact. Send it on, Major. We want the whole skeleton or nothing; no fractions. We will place it in position and adorn its bare occiput with the Comanche scalp that hangs in our curiosity shop. We quote:—

NEW SMYRNA, FLORIDA, July 3d, 1874.

ED. FOREST AND STREAM:—

I have lately been excavating some Indian mounds and in one at my place there are several hundred skeletons, which with their skulls are in perfect preservation. I will send you one when opportunity offers. This mound is of great age. No implements have been found in it thus far, save one of stone, and one flint arrow head.

Truly yours,

GEO. J. ALDEN.

NEW PORTABLE BOATS.—Extreme lightness, compactness and indestructibility are all requisites looked for by the general tourist, sportsman and trapper, in the selection of a boat. The boat invented and manufactured by Mr. John Hegeman of Ballston Spa, N. Y., seems to us to fulfil all these most desirable points. Constructed of a strong folding frame of hickory or ash, secured by gun metal fastenings, it can be quickly covered with a strong cotton duck canvas, which has been proved by thorough tests to have great strength, durability, and to be perfectly water proof. When not in use, the cover may be taken off, the frame folded up and put anywhere, as the boat takes up hardly any bulk. Mr. Hegeman makes five different sizes, from 9 feet long to 13 feet, the first carrying conveniently one person, the latter from five to seven. The folding boat being a flat bottomed one, allows it from its slight draught of water, to carry three people, and it will not draw more than an inch. Its buoyancy is further increased by cork fenders placed under the gunwale. Prices range from \$75 to \$117. A great many of these boats are now in use, and seem to have given perfect satisfaction.

Bonds' improved section boat, made at Cleveland, Ohio, one of which we have in our office, has attracted a great deal of attention, and we understand that this season the maker has had quite large orders.

We hear of a new boat, to be built on a kind of lattice steel frame, which may offer some advantages. It is represented to be exceedingly light.

The meteorological record kept by Maj. Geo. J. Alden at New Smyrna, Volusia county, Florida, latitude 29 deg. 2 min., lon. 80 deg. 4 min., shows the mean temperature for the month of June to be—7 A. M., 81 deg.; 2 P. M., 89.; 9 P. M., 78 deg. Highest 94 deg.; lowest 75 deg. Amount of rain-fall 10½ inches.

—The following letter from our correspondent J. H. Batty, now on the Boundary Survey Expedition, will be read with more than ordinary interest, in view of the anticipated hostility of the Indians on the line of march. Gen. Custer's headquarters are opposite the town of Bismarck, now the terminus of the Northern Pacific Railroad.

BISMARCK, D. T., June 3d, 1874.

EDITOR FOREST AND STREAM:—

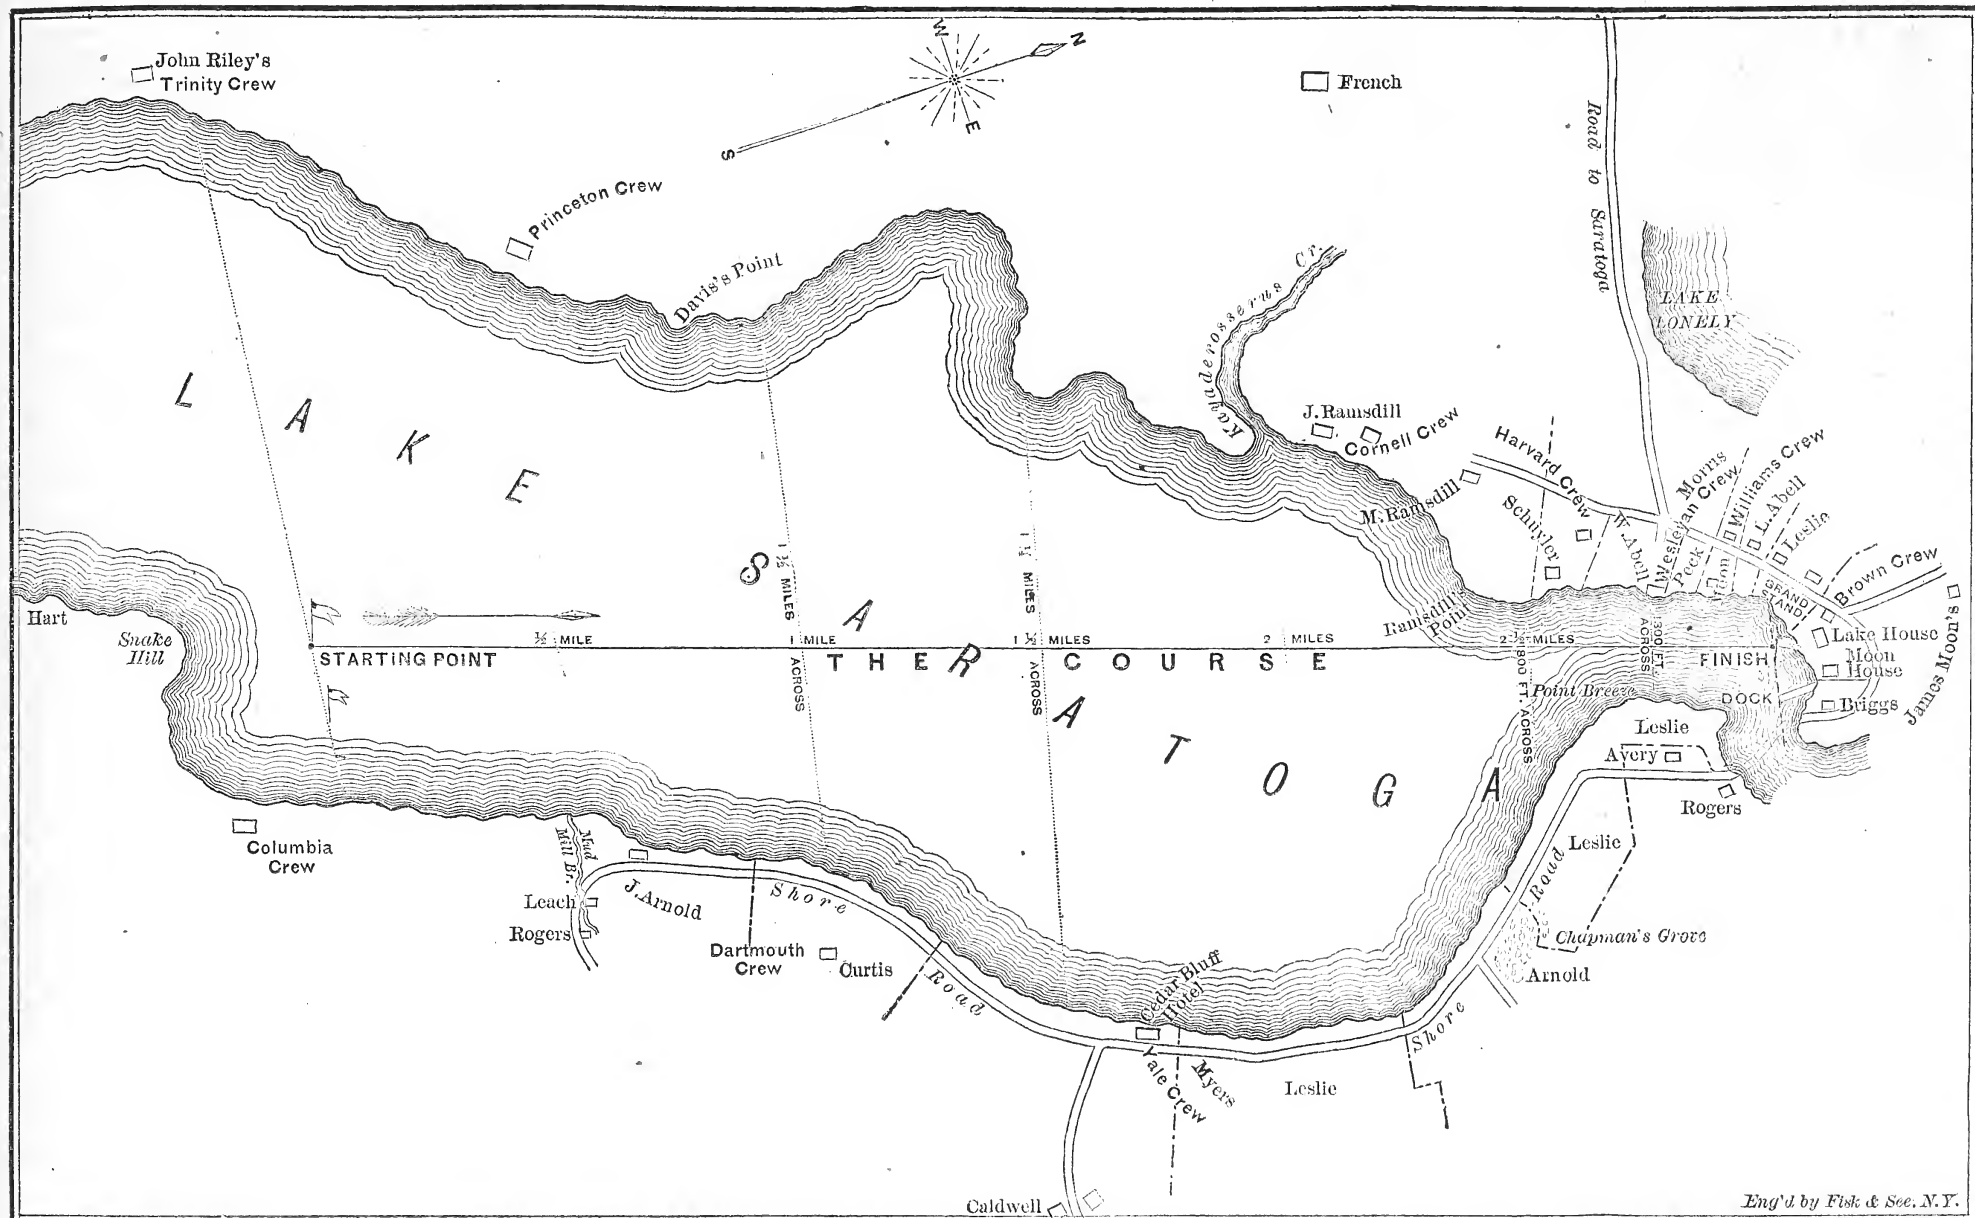

I am now a little nearer my journey's end than when I wrote you last. We will take a boat up the Missouri River in about two days. General Custer left Fort Lincoln on the morning of July 3d (to-day). There is a party of miners fitting out in Montana to visit the Black Hills. There are thousands of ducks, willets, godwits, avocets, &c., breeding on the prairie between Brainerd and Bismarck. Our party (the Boundary Survey) left Fort Buford several days ago. Our commission, Mr. Archibald Campbell and myself, are the last to join the party. There is an escort awaiting our arrival at Fort Buford. Will write when I can.

Very truly yours,

JOS. H. BATTY.

P. S.—The thermometer stood at 108 degrees to-day. It is very hot here and has been for several days.

THE SARATOGA COLLEGE REGATTA COURSE.

WE present to our readers a carefully prepared map of Lake Saratoga. An examination will show the various headquarters of the crews, the position of the starting point, where the finish takes place, and the distances from the start. A map of this character, both for present use and future reference, is worth more than indefinite pages of description.

The crews which take part in the races include Yale, Harvard, Williams, Trinity, Wesleyan, Dartmouth, Cornell, Columbia, and Princeton. Amherst, Bowdoin and the Massachusetts Agricultural do not enter the lists this year. Princeton make her maiden entry. The colors of the crews are as follows:—Brown, brown; Columbia, blue and white; Cornell, carnation; Dartmouth, green; Harvard, magenta; Princeton, orange; Trinity, green and white; Wesleyans, lavender; Williams, purple; Yale, dark blue. The following is the composition of the

HARVARD CREW:

Bow—Walter J. Otis, Law S. S., of Chicago; age, 21; height, 5 feet 9 inches; weight, 158 lbs.

Port Bow—William R. Taylor, '77, of Jefferson, N. Y.; age, 22; height, 5 feet 11 inches; weight, 169 lbs.

Starboard Waist—Henry L. Morse, '74, of Boston; age, 21; height, 6 feet; weight, 170 lbs.

Port Waist—Wendell Goodwin, '74, of Jamaica Plain, Mass.; age, 21; height, 6 feet 2 inches; weight, 179 lbs.

Starboard Stroke—Daniel C. Bacon, '74, of Jamaica Plain, Mass.; age, 19; height, 5 feet 11½ inches; weight, 177 lbs.

Stroke—Richard H. Dana, Jr., of Boston; age, 23; height, 5 feet 10½ inches; weight, 161 lbs.

WILLIAMS COLLEGE.

H. A. Barker, Burlington, Vt., '76, age 20, height 5 ft. 7½ in., weight 141 lbs. (bow); J. H. Haynes, Rowe, Mass., '76, age 25, height, 5 ft. 10 in., weight, 146 lbs.; A. S. Keyes, Bennington, Vt., '77, age, 19, height, 5 ft. 8½ in., weight, 154 lbs.; M. P. Washburn, East Boston, Mass., '77, age 19, height 5 ft. 8½ in., weight 144 lbs.; Charles Gilbert, Wilton, Ct., '76, age 19, height 5 ft. 10½ in., weight 155 lbs.; John Gunster, Scranton, Pa., '74, age 23, height 5 ft. 11 in., weight 150 lbs., (stroke and captain.)

YALE.

G. L. Brownell of East Haddam, Ct., class of '75, Sheffield Scientific School, age 20, height 5 feet 8 inches, weight 155 pounds (bow); F. Wood, Jr., of Norwich, Ct., '75, Scientific School, age 20, height 5 feet 10½ inches, weight 166; D. H. Kellogg of Spuyten Duyvel, N. Y., '76, age 20, height 6 feet ¼ inch, weight 165; C. N. Fowler of Lena, Ill., '76, age 21, height 5 feet 10½ inches, weight 170; R. J. Cook of Fayette City, Pa., '76, age 25, height 5 feet 8½ inches, weight 166 (captain); J. Kennedy of Struthers, O., '75 Scientific School, age 22, height 5 feet 11½ inches, weight 178 (stroke).

The Freshmen crew is as follows:—

C. B. Rockwood of Indianapolis, Ind., Scientific School, age 21, height 5 ft. 10 in., weight 153 (bow); M. G. Nixon of Chicago, Ill., Scientific School, age 19, height 5 ft. 11 in., weight 170; C. A. Clafin of Hopkinton, Mass., Scientific School, age 21, height 5 ft. 8½ in., weight 170; C. S. Merwine of Milton, Pa., age 23, height 5 ft. 9 in., weight 158; W. W. Collin of Penn Yan, N. Y., age 18, height 5 ft. 10 in., weight 181; E. C. Cooke of Worcester, Mass., age 22, height 5 ft. 10 in., weight 175 (stroke).

TRINITY.

George M. Dubois of Fairbault, Minn., '74, age 23, height 6 ft., weight 163 (bow); S. D. Hooker of Watertown, N. Y.,

'76, age 20, height 6 ft., weight 158; John D. McKennan of Washington, Pa., '76, age 21, height 6 ft. 2 in., weight 178 (captain); W. J. Roberts of Detroit, Mich., '75, age 25, height 6 ft. 2 in., weight 180; H. M. Hooper of Griggstown, N. J., '75, age 24, height 6 ft., weight 167; H. O. Dubois of Faribault, Minn., '76, age 20, height 6 ft., weight 160 (stroke).

WESLEYAN.

Stroke—John S. Eustis, '74, Hammond, N. Y.; age 27; height, 5 ft. 11 in.; weight, 168 lbs.

Starboard Stroke—Cyrus P. Marsh, '77, West Newton, Pa.; age, 22; height, 5 ft. 8½ in.; weight, 158 lbs.

Port Waist—Clarence A. Waldo, '75, Gouverneur, N. Y., age, 22; height, 5 ft. 7½ in.; weight, 175 lbs.

Starboard Waist—George M. Warren, '75, Deer Isle, Me.; age, 24; height, 5 ft. 7 in.; weight, 155 lbs.

Port Bow—John W. Whitney, '76, Sprague's Corner, N. Y.; age, 24; height, 5 ft. 10 in.; weight, 146 lbs.

Bow—Walter H. Downs, '75, South Berwick, Me.; age, 21; height, 5 ft. 9 in.; weight, 148 lbs.

A seventh man for any exigency is Harry C. Hermans, '75, Corning, N. Y.; age, 22; height, 6 feet; weight, 166 lbs.

DARTMOUTH.

Bow—W. G. Eaton, Lowell, Mass., '75, age 20, height 5 ft. 11½ in.; weight 164.

No. 2—W. F. Westgate, Haverhill, N. H., '75, age 22, height 5 ft. 11 in.; weight 175.

No. 3—B. F. Robinson, Manchester, N. H., '77, age 21, height 6 ft.; weight 155.

No. 4—C. W. Eager, Manchester, N. H., '77, age 19, height 6 ft. 1 in.; weight 170.

No. 5—F. W. Mitchell, Manchester, N. H., '76, age 21, height 6 ft.; weight 180.

Stroke and captain—C. O. Gates, Summerville, Ct., '74, age 21, height 6 ft. 2 in. weight 180.

Substitute—A. Eaton, '74, age 24, height 5 ft. 10 in.; weight 160.

DARTMOUTH.

Bow—S. J. Bradbury, Providence, R. I.; age, 20; height, ft. 10½ in.; weight, 146.

Port Bow—Arthur G. Griffin, Litchfield, N. H.; age, 20; height, 5 ft. 8 in.; weight, 143.

Starboard Waist—G. W. Dow, Lawrence, Mass.; age, 22; height, 6 ft.; weight, 171.

Port Waist—W. R. Stiness, Providence, R. I.; age, 20; height, 6 ft.; weight, 168.

Starboard Stroke—C. M. Lee, Newport, R. I.; age, 20; height, 5 ft. 10½ in.; weight, 149.

Stroke—W. A. Peck, Barrington, R. I.; age, 19; height, 6 ft.; weight, 161.

Totals—age, 121; height, 35 ft. 5½ in.; weight, 938.

COLUMBIA.

Bow—Philip Timpson, S. of M., age 22, weight 161 lbs., height 6.

No. 2—Gaspar Griswold, academic '77, age 18, weight 167 lbs., height 6 ft.

No. 3—James Wells, S. of M., age 21, weight 160 lbs., height 5 ft. 11 in.

No. 4—Edward S. Rapallo, academic '74, age 21, weight 165 lbs., height 5 ft. 9½ in.

No. 5—Robert C. Cornell, academic '74, age 21, weight 189 lbs., height 6 ft.

Stroke—B. F. Rees, S. of M., age 20, weight 160 lbs., height 5 ft. 9 in.

1st Sub—I. N. Seligman, academic '76, age 19, weight 158 lbs., height 5 ft. 8½ in.

2d Sub—J. Goodwin, academic '76, age 24, weight 164 lbs., height 5 ft. 11 in.

PRINCETON.

W. M. Smith of Paterson, N. J., '74, age 20, height 5 ft. 8½ in., weight 147, (bow and captain); C. B. Cross of Baltimore, Md., '75, age 20, height 5 ft. 9½ in., weight 154; R. J. Hall of New York city, '75, age 18, height 5 ft. 11½ in., weight 160; J. M. Taylor of Philadelphia, '76, age 19, height 5 ft. 10½ in., weight 160; W. A. Addicks of Philadelphia, '74, age 20, height 5 ft. 9 in., weight 153; F. A. Marquand of New York city, '76, age 18, height 5 ft. 11½ in., weight 150 (stroke).

The Freshmen crew is as follows:

C. G. Greene of Cedar Rapids, Ia., age 19, height 5 ft. 7 in., weight 142 (bow); J. A. Campbell of Washington, D. C., age 19, height 5 ft. 8½ in., weight 144; C. Halsted of Newark, N. J., age 19, height 5 ft. 9 in., weight 147; J. F. Williamson of Osborn, O., age 20, height 5 ft. 9½ in., weight 152; J. S. Ely of Cedar Rapids, Ia., age 21, height 5 ft. 10½ in., weight 189; B. S. T. Nicoll of New York city, age 18, height 4 ft. 10½ in., weight 152 (stroke).

CORNELL.

From the following eight men of Cornell six will be picked out:

John N. Ostom of East Randolph, N. Y., '76, age 23, height 5 ft. 10 in., weight 160 (bow and captain); Richard W. Corwin of Narrowsburg, N. Y., '75, age 22, height 5 ft. 11 in., weight 168; James H. Southard of Toledo, O., '74, age 23, height 5 ft. 9 in., weight 148; Madison M. Graver of Pecatonica, Ill., '76, age 25, height 6 ft. 1 in., weight 193; Perry Clark of Bemus Point, N. Y., '77, age 21, height 6 ft. 1 in., weight 179; Louis F. Henderson of Ithaca, N. Y., '74, age 21, height 5 ft. 11 in., weight 156; Ira H. Myers of Nunda Station, N. Y., '77, age 21, height 5 ft. 11 in., weight 175; Charles C. King of Belmont, N. Y., '75, age 25, height 5 ft. 10 in., weight 165.

The weather during the first two days of the week was not propitious, the rain storms on Monday preventing the base ball game between Yale and Harvard, though an impromptu single scull race was rowed between Mr. C. H. Ferry, of Yale, and Mr. Wm. Appleton, Jr., of Harvard. The water being too rough for shells, Whitehall boats were used. Distance, three miles straight, won in a fraction over a half hour by Mr. Appleton.

Unfortunately for the completeness of our report in this week's issue, we go to press on Wednesday of each week, which happens to be the first day of the regatta. However, we have three representatives on the ground, so that, if our summary next week does not prove full and accurate, it will not be for lack of reporters.

—The second season of the Saratoga Rowing Association will take place on Friday, Saturday, and Monday, August 28th, 29th and 31st. First day, August 28th, single scull shells, New York State championship, and double scull shells. Second day, August 29th, pair oared shells and single scull shells (senior). Third day, August 31st, single scull shells (junior), and four oared shells. There will be an extra single scull race of one and a half miles and return, open to any one who is a member of an amateur rowing club; recognized professional rowers excepted. Entries must be made positively on or before the 15th day of August. Address the Saratoga Rowing Association, Saratoga, New York.

Sporting News from Abroad.

[FROM OUR SPECIAL CORRESPONDENT.]

THE irrepressible rabbit has just had another narrow escape; Mr. Pell nearly spotted him this time with a formidable bill, but so badly drawn and in many points so contrary to common sense that it prematurely expired. Ever since the invention of landlords and tenants this wretched little animal has been a source of continual strife and litigation, and a question which no one can solve is, whether the tenant or the landlord ought to kill rabbits, or whether they ought to be classed with stoats, weasels and other vermin, or take the more exalted rank of hares and pheasants. The rabbit is no doubt of considerable importance to the shooting landlord, and he is of great service even at the battues. Boiled rabbits cut up small and mixed with rice and eggs, form the very best food for young pheasants; and if you have a large stock of them, they make the bag at the end of the day look more respectable, if the foxes and "gapes" have thinned the number of your birds. It is wonderful how the poor appreciate them. The country policemen, the waggoners off duty, and even the numerous clod-hoppers who hang about public houses and live by doing nothing, all scent out the days when the covers are shot with the keen instinct of vultures. They are content to scramble through briars and brambles on the roughest country, very often when the snow is on the ground, if they can only get a rabbit and some bread and cheese and beer for their hard day's work. The least sign of a rabbit in their garden is sufficient stimulus for them to walk ten miles to borrow a steel trap.

I do not myself think that the coney does half as much harm as grumbling agriculturists would have you believe. Badly drained, ill-farmed lands, where the manure is put on by the ounce, are always sure to be "eaten up by them rabbits." If it be carefully attended to, a wire netting fence will always keep them out of young wheat; and when it is in the ear they won't hurt it. Turnips they certainly damage unless they are kept back by netting, but swedes and mangolds are but little injured. There is no wild animal amongst all the *fera natura*, as the lawyers call them, which affords such a large amount of sport and benefit to the table. Not one man in a hundred can afford to kill pheasants or grouse, but every country bumpkin boasts about his old single barrel and the number of rabbits he kills. On large tracks of our waste land, on barren moors and desolate commons where the delicate southdown sheep and comparatively dainty cattle would starve, there are rabbit warrens and earths in abundance, and many hundreds of pounds are made out of their flesh, whilst their skins form a species of commerce for many of the Gipsy tribe.

Leaving rabbits to their uncertain fate, I find our legislature has invented a far surer doom for the unhappy betting man. The new act extends to Scotland, and advertising being placed under a ban, the Glasgow and Edinburgh Commission Offices will be closed, and no longer will the plungers be able to invest with as much impunity as if they were buying three per cent stock. I do not, however, think that our moral reformers will ever put down betting altogether, or that fools can be made wiser by parliamentary measures or legal commandments. In the days of Lord Palmerston the "powers that be were too much tarred with the same brush" as the turfites, to interfere with the sporting fraternity.

Cold and windy weather, had the visitors to the Ascot course, though this re-union is certainly the most brilliant one of the racing season, so gay is the ground with fashion and beauty, whilst the horses engaged are the best that England can produce. The added money amounted to close upon £7,000, which showed a considerable increase on former years, and this was excepting the gold vase, a race of no little importance. On Tuesday the royal procession was headed by the Master of the Buckhounds, Lord Hardwicke, and in the first carriage were the Prince and Princess of Wales, and the Duke and Duchess of Edinburgh. The chief features of this day were the winning of the gold vase by Organist, a bay three year old of Mr. Vyner's, who has run so well this spring, and upon which a large amount of money was laid at 11 to 8, and the defeat of Prince Charlie by Mr. Lefevre's Blenheim. Prince Charlie, or as he is usually called, the "Prince of the T. Y. C.," is one of the best, if not the very best of the horses of his day. He is intensely popular with the public, and has won fourteen races without being once defeated. Over and over again Mr. Lefevre has had a cut at him with Blenheim, but it was no use before this, and he is to be congratulated on his plucky perseverance. It has been said that the gallant Prince is a roarer, but be that as it may, at a certain distance he has beaten many a good horse. The Royal Hunt Cup was won by Mr. Bird's chestnut Lowlander, who started first favorite at 4 to 1, and the second favorite Mr. Sturt's Mr. Fox, was beaten off a long way. Blenheim also ran in this race, but was nowhere. There was a large field of twenty-six competitors, the stakes' net value being £1,050.

The "Cup day" on Thursday was very cold and wretched, which was a very lamentable circumstance, for the fair sex especially, as they always appear in the most *recherche toilettes*, and indeed most of even our sporting papers devote half a column to a description of the dresses in the enclosure. The display of silks and satins was never more magnificent, and it seemed as if the whole science of millinery and the costumer's art, had been taxed to the utmost. The taste of last year had been changed. Then it

was strange combinations of opposite tints that captivated the beholders; but now everything the least *outré* had disappeared and given place to delicate shades of French grey, blue, lemon, and canary colors. Mrs. Murrieta, untitled but distinguished, was generally admitted to bear away the palm in her picturesque Spanish hat and feathers, which caught the eye at once amongst a sea of bonnets; but there were many costumes too elegant for any one but a *Parisienne* to describe faithfully. The Royal party was received with the usual loyal shouts, and after two comparatively minor events on the card rendered devoid of much excitement by the absence of George Frederick, the Derby winner, came the *piece de resistance* of the meeting, in the shape of "The Cup." Never perhaps before was there a more splendid array of talent. The six starting entries comprised Doncaster, a quondam Derby winner, Marie Stuart, winner of the Oaks and Leger, Flageolet of the Goodwood Cup, Gangforward, named after the motto of the Crawford family, who won the two thousand guineas last year, and started first favorite for the Derby, Kaiser of the Prince of Wales's stakes, and Boiard, whose prowess on the French Derby and grand prize of Paris had made his name a household word over the water. Marie, the queen of last season, was not much fancied, as his off-hock was disfigured with a thorough-pin, but the backers of Flageolet were very confident, and friends in Gangforward's cause were not found wanting. Boiard, however, started first favorite, and it was soon found that the bookmakers were not far out in their judgment. Fordham, who rode Flageolet, was at one time at least twelve lengths to the good at Swinley bottoms, but though he eased his horse wonderfully, and did all he could to win, he could never get up to the Frenchman at the finish, who won by three parts of a length, without much to spare, as the spur marks on his side, where Carver punished him, bore witness. We are thus retaliated upon by the racing part of the French community, but it is worthy of note that whilst our horse Trent was received with cold silence, the victorious Boiard had a warm and enthusiastic reception. M. Delamarre is one of the oldest and most popular members of the French Jockey Club, and no one deserved success more, if a straightforward love of sport and fairness merit it.

Prince Battiany's Galopin won the "New Stakes," leaving a lot of good horses behind him, and Friday the only race of much popular importance, (if I except the Wokingham Stakes,) was the Alexandra Plate, where Lord Lonsdale upset Boiard *coup* by winning with King Lud, so that the unfortunate plungers who backed the favorite, by way of getting home comfortably, were rather out of it. Possibly the Frenchman was somewhat the worse for his severe gruelling in the Cup race.

The sale of the Royal yearlings at Hampton Court was not so successful as had been expected. The best lot was a bay colt by St. Albans out of Julie, brother to Julius, and most of the horse men at the sale came solely to see him. After some severe competition, he was knocked down to Captain Machell at £1,600, and aptly enough named Julius Caesar. Captain Machell, it may be remembered, is one of the finest judges of horseflesh at present on the turf, next to Sir Joseph Hawley and Admiral Rous, and a few years ago he justly distinguished himself by winning the Derby with a horse called Hermit, who started at 30 to 1, and no one would have him at any price, though the Captain backed him largely in conjunction with his *confre*, Mr. Chaplin. That year the Derby was run in a snow-storm, though it was May, and a gentleman in one of the clubs, a few weeks before, having made the assertion that he expected it would snow when the Blue Ribbon was decided, he was at once offered 1,000 to 1 that it didn't, and curiously enough he won these astounding odds. There seems to be a lack of new blood at Hampton Court; St. Albans, Young Melbourne, who is very old, by the way, and Trumpeter being the only stallions at the breeder's disposal, and many colts and fillies fetched under £50.

The inter-university bicycle match was ridden from Oxford to Cambridge, a distance of 85 miles, though the competitors were not obliged to adhere to the same route. Three men started on each side, but the race was rendered somewhat devoid of interest by the early retirement of the Oxford dark blue, only one out of the three going the entire course. At 9:30 the half dozen started on the Headington turn-pike road. The first to arrive at Cambridge was Mr. St. John Mildmay, who completed his journey at 5:54, having stopped a short time for lunch at Dunstable. At 6:34 the Honorable J. Plunkett arrived, and at 7 o'clock Mr. Penrose, the surviving Oxonian, tottered in. Mr. Plunkett and Mr. Penrose rode on machines made by the Coventry Machinist Company, measuring respectively 53 and 50 inches. Mr. Mildmay's bicycle was a Timber Lake of Maidenhead and measured 47 inches. The victor was heartily cheered and "chaired." Bicycling has become quite an established fact, and there are numerous clubs whose meets are well attended.

The longest score in an innings possibly ever made at cricket was run up the other day in the match between St. John's College and that of Corpus Christi, no less than 681 runs being the total.

I have to report a sad accident at Polo. During the game at Windsor Park, between the First Life Guards and the Foot Guards, Captain Dansey's pony on charging cannoned against the grey which Captain Reynardson rode. Both horse and rider fell, the pony rolling heavily on to Captain Reynardson, who was prostrate on his back. He was carried off the ground insensible, and sustained serious if not fatal injury.

IDSTONE, JR.

Sea and River Fishing.

FISH IN SEASON IN JULY.

Salmon, <i>Salmo Salar</i> .	Salmon trout, <i>Salmo conifinis</i> .
Trout, <i>Salmo trutta</i> .	Michigan Grayling, <i>Thymallus tricolor</i> .
Land-locked Salmon, <i>Salmo gloyeri</i> .	<i>micropterus nigricans</i> .
Black Bass, <i>micropterus salmoides</i> .	Sea trout, <i>Salmo tinnuclatus</i> .
Striped Bass, <i>Roccus lineatus</i> .	Weakfish.
Bluefish, <i>temnodon saltator</i> .	

—Very little change in the fish market. Salmon abundant, retailing at twenty-five cents. Blue fish *en masse*, and worth six cents, and take 'em for five. Spanish mackerel, almost six pound fish coming from Long Island, Babylon, worth sixty cents. In three or four weeks from now they will be down to twenty-five cents. Striped bass, small sized ones, being the most choice, scarce, and gone up to twenty-five cents, while the big ones are more plenty, and selling at fifteen to eighteen cents. The little fish are coming from Baltimore, the big ones from around Newport. Very handsome game looking Canadian trout in fair quantity, selling for a half dollar a pound. Seabright, N. J., is making itself a reputation for fine lobsters. On Tuesday quite a handsome lot came in, the highest turning the scale at eighteen pounds. Sea bass, small yet, three pounders coming from Jersey coasts. In three weeks they will weigh up to seven pounds, and will then be worth talking about.

—Dr. Kenworthy writes under date of July 11th, as follows: "Through the influence of the FOREST AND STREAM, visitors to Barnegat have wonderfully increased. Hotel accommodations are insufficient, and more boats are required than can be supplied." He adds: "Last Tuesday evening an immense school of very large fish entered the bay, and the slaughter commenced. At the Light House, all who could not obtain squids, used *rakes* and *hoes* to haul them in. This is no fish story. About three weeks ago, Kinsey, of Kinsey's Hotel, landed eleven in a few minutes with a garden rake, fish weighing 60 lbs. We have on hand some very valuable papers on the habits of blue fish and their resorts, prepared by the Doctor, but these, like a mass of other material, equally valuable, we are obliged to defer.

—To those wishing to know the route to the Blue Fishing at Barnegat and the Sheephead, and Weak fishing at Tuckerton and Beach Haven, we say: "You can take the boat at pier 8, at 9:40 A. M., and go via Sandy Hook and Whittings to Barnegat, reaching there at 1:56 P. M., in time for a sail and fish in the P. M.; or, take the same train and same route, reaching Tuckerton at 2:42 P. M.; or you can leave New York, foot of Courtlandt street, Pennsylvania railroad, at 12:35; Newark, 12:55 P. M., via Trenton, New Lisbon and Whittings, reaching Barnegat at 6:25 P. M., Tuckerton, 6:55, and Beach Haven, 7:25 P. M., in time for a good supper, engage boats, and a good night's rest, and ready for sport early next morning. Trains leave for Philadelphia and New York in the morning; also leave Beach Haven 3:30, Tuckerton 4:06, Barnegat 4:35 P. M., reaching Philadelphia at 7:05, Newton 7:52, Newark 9:51, and New York at 10:22 P. M.

The best blue fishing is often found at Barnegat, but for the last three weeks, it has been just as good in Little Egg Harbor or Tuckerton Bays. Outside one is as good as the other. The same is true of black fish and sea bass, but for weak fish and sheepheads, Little Egg Harbor and Tuckerton Bays lay over them all.

Passengers can leave Philadelphia at 7:45 A. M., and 3:45 P. M., foot of Market street, no change of cars, though. As to hotels, the Clarence and Mullen Houses at Barnegat, the Everett and Carlton Houses at Tuckerton, are good country houses. Terms, \$2 per day or \$10 per week. Parry House, at Beach Haven, and Bonds at Long Beach, are A No. 1—terms \$2.50 per day or \$14 per week. Both of these are on the beach, near the Inlet, and convenient to the fishing grounds. Good boatmen, fine yachts, and good fishermen to be had at either and all of these places. Terms from \$3 to \$5 per day, according to size of boat and length of time engaged.

—An enthusiastic dealer in puts and calls, longs and shorts, general averages, and all that sort of thing, current in Wall street, tells us in the following note what he and his two friends did at Barnegat on the "Glorious Fourth." He says:—

"We left New York at 4:30 P. M. on the magnificent steamer of the New Jersey Southern Railroad Co., bound for Waretown, N. J., where we embarked for Captain Charlie Cox's Club House on Long Beach. Mr. E. P. M., a wealthy gold broker, Mr. H. A. H., a famous banker, Mr. F. W. V., a retired cotton planter, composed the select but enthusiastic company. After a delightful repast at the Club House, (appetites freshened by the salubrious breezes) consisting of raw clams, fried clams, stewed clams, and by way of change, clam chowder. We started for the hunting ground under guidance of that noble and accomplished searcher of the "briny deep," Jesse Birdsall of Barnegat, N. J., who as the sequel proves well merits this reputation. Invitations having been forwarded in advance to all the schools in the vicinity, a fair percentage put in appearance, *primaries*, excepted. The first day's log showed the great haul (not *Oakey*) of sheephead; second day, twelve; third day, fifteen, together with any number of small fry, which we consider good sport for novices. We think 262 pounds of sheephead a consummation sufficient for our expectations.

ONE OF THE PARTY.

—Dr. D. C. Estes writes from Lake City, Minnesota, July 10th:—"Have had one week of glorious camp life on Rush River, largest trout two pounds and ten ounces. All the streams have yielded finely. Lake fishing rather poor. The Mississippi has been on a regular tear, is awful high, and has been all the season."

—The Great South Bay of Long Island is full of big blue fish, the catches rivaling those of Barnegat. Thumbstalls and sticking plaster are in demand. Go to Babylon, Islip, or Fire Island.

—Squeteague have struck into the waters of Buzzard's Bay.

—June 26th a school of young whales known as black-fish floundered into Maddequet harbor, Nantucket, and were driven ashore by parties in boats. Only two or three escaped, the number captured being ninety-one. They vary in size from six to twenty feet. The captors expect to realize about \$2,000 from the oil.

—Col. H. D. Jarvis, of Boston, caught at Noman's Land, July 7th, eight striped bass, with rod and reel, the largest weighing 60 pounds and the smallest 37 pounds. The total weight of the lot was 328 pounds. Large bass were very plenty at the island, and if the Colonel had not been short for bait a tremendous catch would have been made. Two lobsters were all he had.

—Our attentive correspondent, F. W. S., writes that trout-fishing in the region around Portland was never better than now.

—Friends recently returned from Moosehead Lake, in Maine, report the fishing of all kinds to be much better than for many years previous. Lake trout, bass, speckled trout, etc., are now to be had in remarkable abundance, while those who defer their trip until September will enjoy the shooting and the gorgeous tints of the autumn foliage.

—The editor of the Calais (Me.) Times while casting his flies on a meadow near that city Saturday, June 30th, was attacked by six mink, four of which he dispatched. This sounds like a fish story, but it is vouched for.

EDITOR FOREST AND STREAM:—

We are informed that among those who annually visit Grand Lake Stream, in Maine, there is one over whose official head the frosts of many winters have gathered, and whose years of experience as a fly fisherman ought certainly to entitle him to the appellation of a true sportsman, but when he seeks out the best position for fishing, holding it at all hazards, through cloud and sunshine, through storm and wind, through good report and evil report, sometimes ordering his meals brought to him, or if going himself, leaving his rod and guide to hold the spot till his return, and fishes from twelve to fifteen hours a day, and who remains from two to three weeks on the ground, making some days very large catches, and then sends them to the market, when he does all this, all true sportsmen must regret it, and he must not be surprised to hear that he is called the "fish hawk."

It is an open question whether such a man is a sportsman, angler or day laborer; whether or not it would be advisable for the "fraternity" to fit up a raft with a good supply of fishing tackle, gaffs, nets, etc., etc., and prevail on him to drift out over the dark blue ocean, whose depths and resources are inexhaustible and in which he could indulge not only in deep sea fishing but deep sea bathing.

SALMO.

The foregoing complaint comes from a most trustworthy and honorable witness. We regret to say that it has been attested to by three or four of our personal friends who have recently returned from the Grand Lake Stream. It is certainly a most extraordinary case of untiring selfishness, and challenges duplication.

—"Trout fishing was never better, not a day passes but I see large strings, many of them havin' trout weighing from three to five pounds. The woods also are alive with deer."—Letter from H. K. M., Marquette, Michigan.

—Parties thinking of visiting Yarmouth, Nova Scotia, can secure passage and staterooms on S. S. "Linda," or procure any information in regard to fare &c., by writing to Messrs. J. G. Hall & Co., 64 Chatham street, Boston, Mass.

—Rev. J. Clement French and Rev. C. Hall Everist, both of Brooklyn, we understand are booked for the Nepigon River this month. From this time on until October is the best time to visit this magnificent region. Take a heavy rod. A light salmon rod is the best. One of the best spots for fishing is in the eddy of the island that divides the rapids at Pine Portage or Camp Campbell, the fourth of the series of rapids. It can be reached by canoe. Anchor in the eddy. This is one of our secrets that we sometimes let slip in a spasm of generosity.

—Last week we tested for the first time the qualities of Fowler's rubber reel, and found it worked to our complete satisfaction. Its lightness is charming. We noticed two of these reels in use by experts at the Fly casting Trial at Oswego.

—Those in quest of superior angling resorts this summer, will do well to examine our advertising columns. The routes of travel which we designate, lead up to the very best fishing grounds in Canada and America—to Umbagog, Androscoggin, Moosehead, Schoodic, Sebago, all the famed resorts of New Brunswick and Nova Scotia and the less known but superb regions of Cape Breton and Prince Edwards Island; to all the great Lake Superior region and the North-west, the Thousand Islands and the St. Lawrence; and to the altogether new and attractive summer resort of Muskoka Lakes and the Magnetawan River in Canada. A few select sportsmen's houses are mentioned—Pelsue's, in the Adirondacks, the Twin Lakes, in the Housatonic Valley, and Garrett and Maus' at the Great Falls of the Potomac. The Rossin House, Toronto, and the International, at Niagara Falls, are always popular places of resort with sportsmen, because their proprietors are first-class sportsmen themselves, and a "fellow feeling makes them wondrous kind."

Persons seeking refreshing breezes and change of scene nearer home, will find that Long Branch possesses all that is needed to complete enjoyment. Six trains run daily

from New York. See advertisement in this paper of railroad time table and desirable hotels.

—The International Steamship Line between Boston and St. John, N. B., touching at Portland and Eastport, is the most desirable thoroughfare to some of the finest sporting regions in the States and Provinces. Moosehead Lake, the Grand Lakes of the St. Croix, the St. John River, the great game and fish districts of Nova Scotia and the Gulf of St. Lawrence, as well as the more remote regions of Prince Edwards Island, Cape Breton, and Newfoundland are reached by this and connecting routes. The time between Boston and St. John is about thirty-two hours, but can be shortened by taking the railroad to Portland and the steamer at that place. At Eastport, take steamer for Grand Lakes or Schoodics. The steamers accommodate several hundred guests, and fifteen years experience of our own will attest to the excellence of the table and the civility and kindness of the officers. Staterooms should be engaged in advance at Boston or Portland. Three months remain to the tourist and sportsman of the most desirable part of the year.

—The Williamson House at Lackawaxen, Pennsylvania, which was destroyed by fire a year or two ago, has just been rebuilt and reopened, with increased accommodations and improvements. It is located in a beautiful valley on the Delaware River, and is in the centre of a game and fishing region for whose excellence Pike county has long been noted. It is accessible by railroad from all parts of the country, and is the point from which carriages start for Blooming Grove Park, from which it is fourteen miles distant. Sportsmen and families can find good board here at old time country rates, either by day or week.

THE OLD QUESTION—DO BLACK BASS TAKE A FLY?

PROVIDENCE, R. I., June 29th, 1874.

EDITOR FOREST AND STREAM:—

I have read the pros and cons on the subject of fly-fishing for black bass in your valuable paper, and have about come to the conclusion that they will, and that they won't take a fly. But who knows whether they will or not in certain locations until somebody tries a fly or flies for said fish?

Acting on the supposition that black bass might be induced to chew feathers, or something more substantial, I started with Dr. C. for a pond ten miles distant, which had been stocked with black bass some three years ago, through the indefatigable efforts of our most worthy but unappreciated Fish Commissioners.

But said Commissioners are appreciated by some, and all will sound their praises by-and-by.

Arriving at the pond—Swampscott North Scituate, R. I.—we procured a boat of a Mr. King—stranger to us, but a gentleman and an angler—who would not let, but would lend us a boat; a spirit to be appreciated in these days of the "last dollar."

So far, we prospered; time now 5 P. M., sun shining bright and hot, wind blowing strong from northwest—not much of a fishing day. Friend C. made first cast with a "minnie," but could not get a rise, which was not very encouraging, but like a true angler, persevered. Thinking the bass were not quite ready for substantial, perhaps might be tempted by shams, I tied on a nondescript fly made of peacock herl with prairie chicken wings on No. 2 Sproat bend; for drop fly, a red ibis, same size hook, both of which were of my first attempt at fly tying, from directions given by Norris in his "American Angler," and FOREST AND STREAM.

Honor to whom honor is due.

After making a few bungling casts with a heavy rod made for trolling only, I got a strike and soon landed my first black bass.

Worth a dollar! though it would hardly weigh half a pound.

But I had demonstrated the fact that the unappreciated efforts of our Fish Commissioners were a success, and that black bass in this pond, will take a fly, even under the most unpropitious circumstances—such as a novice throwing a crude fly in a gale of wind with a hot sun and roiley water. Suffice it to say, our bag was small, but nevertheless highly satisfactory, consisting of only a few bass, but one was estimated to weigh two and a half pounds. One good fish and two flies were lost by the parting of a leader which was defectively tied—my fault.

Should say from this one trial that bass are quite plenty in this pond. As regards flies the red ibis seemed decidedly the best, as it was the fly struck at every time. I understand that the local fishermen use worms for bait with some success; but their spoken opinion is that fish are scarce, but I differ with them.

When we learn more about the manner of catching black bass, I presume we shall find plenty of them. Yours respectfully,

ESPRIT FORT.

NEWARK, N. J., July 8th, 1874.

EDITOR FOREST AND STREAM:—

On the afternoon of July 1st a party of five Newarkers might have been seen wending their way to the depot, arriving in time for the 2:30 P. M. train for Barnegat, N. J., in anticipation of enjoying the delightful sport of catching the bluefish. We arrived at Barnegat at 10:30 P. M. Next morning we were up bright and early, and meeting with Capt. Joel Ridgway and Capt. Jesse Burdell, we were soon under sail with our two boats; with squids out, we were soon busily engaged in catching the fish. At one time each of us had a fish on his line. We were fishing 6½ hours and caught 300, weighing about 700 pounds. Weakfish and sheepheads are beginning to bite, but they will bite better in a few days. Both of our Captains are men who thoroughly understand their business, and are polite and gentlemanly, and I would advise all those who are going down to Barnegat this summer for the bluefish to secure the services of Capt. Joel Ridgway or Capt. Jesse Burdell, and they will have a good time and plenty of fish.

F. H. A.

—A resort that ought to be brought more generally to the notice of the people outside of Connecticut, is the "Thimble Islands," lying between New Haven and New London, and reached by the Shore Line Railroad from Stoney Creek, Branford or Guilford stations. There are several hundred of these islands, with bold shores, and splendid sea fishing of all kinds convenient, offering greater variety and change of scenery than is usually afforded by any single pleasure resort. A cruise among these islands in a yacht gives perfect *dolce far niente*. The old Double Beach House, a famous resort for fifty years, the Branford Point House, and a dozen new ones, offer abundant hotel accommodation. Many of the islands are occupied by private cottages. The pleasantest way to reach the islands from points south of New York, is to take the New Haven steamboat line at Peck Slip, New York, at 11 P. M., sleep all night comfortably, and reach Stoney Creek in time for breakfast.

Yachting and Boating.

All communications from Secretaries and friends should be mailed no later than Monday in each week.

HIGH WATER, FOR THE WEEK.

BROOKLYN YACHT CLUB.—The annual cruise of the Brooklyn Yacht Club begins on Wednesday, July 22d. The following is the programme:—

1. Wednesday afternoon, July 22, (high water at 4 P. M.)—rendezvous at Glen Cove.
2. Thursday, July 23.—Get under way for Morris Cove, New Haven.
3. Friday, July 24.—Get under way for Greenport.
4. Saturday, July 25.—Excursion and clam-bake at Shelter Island.
5. Sunday, July 26.—Divine service on board the flagship.
6. Monday, July 27.—Under way for New London.
7. Tuesday, July 28, (full moon).—For Newport.
8. Wednesday, July 29.—Regatta at Newport.
9. Thursday, July 30.—The fleet will visit Rocky Point.
10. Friday, July 31.—The fleet will get under way for Martha's Vineyard and await the further orders of the Commodore.

Yacht-owners intending to join the squadron on the annual cruise will report to William T. Lee, Secretary, at the club rooms, corner of Court and Montague streets, Brooklyn, or at No. 114 Wall street, New York.

—The 4th of July regatta of the Perth Amboy yacht club, which was noticed in FOREST AND STREAM of the 2d inst., came off as advertised, and was quite successful. The following is a list of the yachts which started:—

FIRST CLASS.		
Name.	By Whom Entered.	Length.
*Lizzie.....	A. B. Smith.....	29 7½
Brooklyn.....	Ira Smith.....	27 5
*J. M. Chapman.....	J. M. Chapman.....	25 8½
SECOND CLASS.		
Emily P.....	James Sweeney.....	21 8
*Chi Psi.....	Messrs. Scott & Boggs..	20 7½
Hyacinth.....	Charles Soffield.....	22 2
*Hitty McGinn.....	J. L. Kearney.....	21 8½
Jno. M. Lanthier.....	A. S. Brush.....	21 4½

*Perth Amboy Club boats.

The first prizes (\$100 and \$75) were taken by the Brooklyn and Emma P. The second prizes (\$50 and \$30) were won by the Chapman and Chi Psi, as were also the club pennants. During most of the time the wind was light and baffling, but increased on the home stretch to a light breeze. The whole affair gave general satisfaction to a large number of spectators.

BROOKLYN, July 12, 1874.

EDITOR FOREST AND STREAM:—

I send you herewith a report of the regatta, sailed at Greenport, L. I., on the 4th instant. It is cut from the local paper.

When the number and size of the boats, length of course, (i.e., etc.) is taken into consideration, I believe it will be found to be one of the closest races on record, and as such worthy of note.

It is seldom necessary to reckon time in yacht sailing by seconds and fractional parts of seconds as in horse racing. Yours truly,

MELVILLE BRYANT, M. D.

We thank our correspondent for his courtesy and attention. The record will be useful for reference, but want of space will prevent our giving more than a brief summary of the events. In the scull-race over a distance of 1½ miles, ¼ of a mile out and return, the Annie won. The Annie was rowed by Frank Homan and Gilbert Raynor. Time—18 min. 34 sec.; Fannie, 19 min. 16 sec.; Belle, 19 min. 31 sec. In the sailing race, a distance of fifteen miles for the 1st class, the Fannie won by 1 min. 42 sec., the whole corrected time being 2-11-7. The Irving C. Wells won the second prize by 1 min. 40½ sec. A lady's prize for a single scull rowing match was won by Miss Richards. The programme was further varied by tub races, scrub races, etc.

BOSTON YACHT CLUB.—Commodore Dean has designated Saturday, July 18th, at Meridian, as the time, and off the Club House at City Point, South Boston, as the place for the annual review of the yachts of this club. Immediately after the review the fleet will start on their annual cruise, sailing for Hull Harbor, where they will anchor for the night, and thence to Gloucester, where the peremptory cruise will terminate. The cruise is made short, so that the smaller yachts may participate. If, after arriving at Gloucester the yacht-owners so desire, the cruise will be lengthened. It is now some years since the squadron has been formally reviewed.

SWAMPSCOTT, MASS., July 6, 1874.

EDITOR FOREST AND STREAM:—

The first regatta of the Beverly yacht club took place this morning in Swampscott harbor. Distance, five miles; the first class sailing twice over the course. The preparatory gun was fired at seven minutes past twelve, and the gun for the first class five minutes later, when the following sloop yachts started, with a good, free southeast breeze, namely:—Ariel, W. D. Schier; Eva, W. H. Bangs; Sunbeam, W. S. Nickerson; Surf, W. C. Loring; Fanchon, A. Burgess; Leslie, F. H. Peabody; and the cat boat Ruby, G. W. Preston.

The second and third classes started at intervals of five minutes, all the boats being cat rigged, namely:—Peri, S. W. Burgess; Ibis, H. C. Leech; Thetis, A. B. Denny; Curlew, W. Tappan; Lady Clara, C. W. Reed; Hebe, G. A. Goddard; Mona, H. Richardson; Water Lily, P. Grant, Jr. Third class—Bluebell, W. A. and W. H. Jeffries; Tulip, W. Burgess; Virginia, A. C. Plimpton; Pink, I. B. Mills, Jr.

The largest of the sloops was Mr. Bangs' Eva, 25 feet, 9 inches in length; the cat boats of the second class averaged about 19 feet, and the third class 16 feet.

The Surf took a reef in her mainsail before starting, but afterwards shook it out. After rounding the stakeboat off Little Nahant the yachts encountered a strong head wind, with a heavy chop sea, which told greatly on all the small boats except the Tulip. The whole fleet beat up the Nahant shore to the Egg Rock stake boat, except the Ariel, which had parted her peak halyards and hauled out of the race. From the

stake boat quick time was made to the judges' yacht Halcyon, which was rounded in the following order:—Eva, Fanchon, Sunbeam, Peri, Surf, Ibis, Lady Clara, Curlew, Leslie, Ruby, Water Lily, Hebe, Thetis, Tulip, Mona, Bluebell, Virginia, and Pink.

The first class boats, in making their second round, found even more sea than in the first, and the crews got pretty well soaked before crossing the home line, which they did as follows:—

Yacht.	Actual time. H. M. S.	Corrected time. H. M. S.
Eva.....	1 30 20	1 55 02
Fanchon.....	1 42 06	1 58 09
Surf.....	1 53 00	2 06 17
Leslie.....	2 05 48	2 14 40
Sunbeam.....	Not timed.	
Ariel.....	Not timed.	
Ruby.....	Not timed.	

Yacht.	Actual time. H. M. S.	Corrected time. H. M. S.
Peri.....	56 25	56 25
Ibis.....	57 08	58 33
Lady Clara.....	58 13	59 58
Curlew.....	59 59	59 59
Water Lily.....	1 01 51	1 02 16
Hebe.....	1 03 01	1 03 22
Thetis.....	1 06 53	1 07 33
Mona.....	Not timed.	

Yacht.	Actual time. H. M. S.	Corrected time. H. M. S.
Tulip.....	1 01 01	57 53
Bluebell.....	1 05 59	1 02 41
Virginia.....	1 10 16	59 32
Pink.....	1 13 06	1 07 35

The prizes were a piece of silver plate as first prize, and cup as second prize in each class. A champion pennant was also given in each class for the best time over the course, to be held till the next regular race, and at the end of the season to become the property of the boat winning it the majority of times.

The winning yachts are the Eva, first prize and pennant; Fanchon, second prize. Peri, first prize and pennant; Ibis, second prize. Tulip, first prize and pennant; Pink, second prize.

The noticeable feature of the club is that it is a Corinthian club, each member sailing his own boat, thirteen successful regattas having been sailed under these rules. Yours truly,

BLUE WITH A GOLD CASTLE.

—Arrangements are being made to have a grand regatta at Provincetown, Mass., on or about the 27th inst., in which all boat owners on the Cape are expected to participate.

—The yachts of the Dorchester yacht club will sail on their annual cruise under command of Commodore Bangs August 22d. It is the intention to be gone a week, and to visit Portland during the cruise.

—The sloop yacht Starile, Capt. Plummer, of South Boston, participated in the sailing regatta July 4th at Gardner, Maine, carrying off the honors.

—The judges in the city of Boston sailing regatta, July 4th, last week made the following awards to the third class keel yachts:—First, to the Ruby, \$70; second, to the Fearless, \$35; third, to the Gleaner, \$25.

—Five persons were drowned at Atlantic City on the 10th instant by the capsizing of the yacht A. B. Thompson.

—The cruise of the yacht Starile is unavoidably deferred until our next issue.

—The fourth regatta of the Dorchester yacht club will take place next Saturday, at 2:30 P. M., from Commercial Point, Boston. It will be for third class centre-board yachts over course No. 2, and the prize will be a solid silver cup.

—The judges of the regatta of July 1, of the Eastern yacht club, have notified Captain Boardman that his yacht, the Foam, was entitled to the first prize, the owners of the Brenda having forfeited it by disregarding the rules of the race. Captain Boardman has tendered the prize to the club, to be again sailed for.

—The America, General Butler's yacht, was on a cruise to Vineyard Haven last week, having the General and a party of his friends aboard, among whom were his son-in-law, Governor Ames, Mr. Ames, Sr., Commodore Benjamin Dean and Colonel R. G. Usher.

ROYAL HALIFAX YACHT CLUB.—On Wednesday evening, July 1st, the Commodore and a number of the members assembled at the club house for the purpose of presenting to Alexander W. Scott, Esq., Rear Commodore of the club, a testimonial of their appreciation of his valuable services while filling the office of Secretary for many years. Commodore Wood presided and ex-Commodore Wyld read an address, which was gracefully responded to by Mr. Scott. The testimonial is in the form of a nautical cup, beautifully wrought in gold and silver. It is surmounted by two dolphins intertwined round a trident. The chasings, which are elaborate, are in gold, and in addition the cup is ornamented with drawings of yachts and other appropriate designs, including the arms of the club and the city of Halifax. It was manufactured by Messrs. Edward Barnard & Sons, Angel street, London, and reflects great credit on the donors, the manufacturers, and on the taste displayed by Charles Cogswell, Esq., M. D., London, by whom it was selected. The cup bears the following inscription:—

Presented to
ALEXANDER W. SCOTT, Esq.,
by the members of the
ROYAL HALIFAX YACHT CLUB,
Dominion of Canada,

In appreciation of the valuable services rendered by him to the club while holding the office of secretary for many years.
1874.

PORTLAND, July 13, 1874

EDITOR FOREST AND STREAM:—

A match has been arranged between two amateur scullers of this city for a three-mile turning race for \$200, to be rowed at 6 P. M. on the 27th instant. The contestants are Aleck Stewart, of the Emerald Club, and John O'Donnell, who hails from the Orienta House, although not a member of that organization.

The yacht club had a pleasant and satisfactory cruise last week. The schooner Sparkle did not return with the fleet but kept on to Mount Desert, and Mr. Knowlton's new steam yacht starts for the same locality to-day with a small party of pleasure-seekers. The sloop Lurline, Captain Fuller, is being altered and improved.

THE ARGONAUTS AND ATALANTAS.—On Saturday, by half past eight o'clock in the morning, the river above the Fourth avenue bridge was crowded to witness the race between the Argonauts and the Atalantas. Course three

miles straight away, from some four hundred feet above the bridge to Morris' Dock, above High Bridge. The start took place at half past nine, Mr. Frank Bacon, the referee, giving the send away. Without very fine style, but amazing propelling powers, the Argonauts got away, while their adversaries were models as to precision and neatness of stroke. With a stroke of about forty-one to forty-two to the minute, the Argonauts took the Westchester side, both crews being rather close in shore. At about McComb's dam the Atalantas were fully three quarters of a length astern. Here there was apparently some indecision about the course of the Atalantas, as they headed for the middle of the channel and quickened their stroke; but the Argonauts still kept forging ahead. Near High Bridge, despite a plucky effort on the part of the Atalantas, which closed up some of the gap, the Argonauts, still a trifle elegant, seemed not to have lost an ounce of pull in them, and without any amazing effort came in as winners—time, 17 min., 57½ sec.; not quite up to some other performances by the winning boat, but was accounted for by the tide just setting against them at the conclusion of the race, and somewhat of a breeze.

Summary.—Argonauta Rowing Association, Bergen Point, N. J., vs. Atalanta boat club, New York; four oared race; three miles straight; Argonauts challengers:—

ARGONAUTA CREW.	Pounds.	ATALANTA CREW.	Pounds.
Edward Smith, bow.....	140	Edward Blake, bow.....	140
Walter Man, 2.....	150	William H. Spear, 2.....	149
Benjamin Stephenson, 3.....	154	Theo. Van Raden, 3.....	155
Fred. C. Eldred, stroke.....	160	Dr. R. Withers, stroke.....	158
Total pounds.....	604	Total pounds.....	602
Time, 17:57½.		Time, 18:03½.	

—The Triton Rowing Association of Pamrapo, New Jersey, enjoyed a very delightful festival and reunion at their club house on Saturday evening, July 11th, at which the ladies participated. We tender our thanks for courtesies.

INTERNATIONAL BOAT RACE.—On the 8th of July, at Springfield, Massachusetts, was decided the much talked-about contest between George Brown, of Halifax, and Wm. Scharff, of Pittsburg, Penn. Brown, the Halifax champion, stands 5 feet 9½ inches, and when in good training will weigh from 158 to 160 pounds. Scharff is Brown's junior by fully ten years, is an inch or so less in size, and weighs 145 pounds. Both men are exceedingly quiet and gentlemanly, and have shown their skill and pluck on many former occasions. At half past five o'clock both men were ready, Scharff using a cedar shell made by Epsy, of Pittsburg, and Brown an English boat, made by Jewett. The course was from the bridge, two and a half miles, to the stake boat and return. At a very few minutes after half past three Commodore Brady gave the word "Go." Both men struck the water almost simultaneously, Scharff leading. After about one hundred and fifty yards Scharff buckled to his work, and challenged Brown, the latter making forty-one strokes, the former fully one stroke more a minute. It looked for the first mile and a half an even thing, but after that either the strength, stamina, or skill of Brown put in for the lead. Now Scharff put on spurt after spurt, but without effect, as Brown seemed able to snake off his opponent when he felt like it. After the two miles were passed Brown led fully two boat lengths, and turned the stake boat two and a half lengths ahead of Scharff. Coming home the quick work caused both men to lower the rapidity of strokes; Brown's was now below the forties; Scharff's certainly very little over the thirties, with Brown still increasing his lead. Now the power or the reserve strength of Brown was manifest, for though Scharff had plenty of pull left in him he never let things loose to get ahead again but that Brown was better. Brown finally came in ahead just one and a half boats length, and won the race—time, 36:25, though the Canadians claim a few seconds less. The race was a splendid one, and highly creditable to both oarsmen. All hands were fortunate in having Commodore Brady as referee. It is now possible to contemplate the chances of a race between Sadler and Brown. It is Brown's ambition, so it was stated to us by Mr. Vose, of Halifax, who arranged the preliminaries of this race, to have a tussle at the oar with the redoubtable Sadler. Scharff may find this consolation, that he is at the age when he may do even better. He certainly in this race worked nobly to win.

—The Northwestern Amateur Boating Association will hold its sixth annual regatta at Toledo on Wednesday and Thursday, July 22d and 23d. The programme will include races of six and four oared shells, double and single sculls, barges, etc. Address E. T. Waite, Secretary, at Toledo.

CANOE CRUISING.

NUMBER THREE.

IN my last paper I described the canoe which I believe will be found best adapted for cruising in. To show that I am not singular in my opinion of the Nautilus type of canoe as a cruiser, I give an extract from the English *Field* of May 16th:—

"NORTHERN BRANCH ROYAL CANOE CLUB.—The 'Nautilus' has been tried as a cruiser and unanimously condemned, and double canoes are very unfavorably regarded by the canoeists of the Mersey. The only Ringleader in the branch is about to be discarded for a Rob Roy. As the members of the Northern Branch have had considerable experience of both river and sea work, their opinion is fairly entitled to some weight, although it militates against the views held by such renowned cruisers as Ringleader and Banshee."

That is, as regards the Ringleader canoe, this is the opinion of the members of the Northern Branch of the Royal canoe club. As they appear to have only one Ringleader in the club, however, their experience of them cannot be said to be very extensive. They recommend "an improved Rob Roy canoe, with about six inches sheer! and plenty of comber." I believe, however, that a canoe such as I described, which closely approximates the Ringleader type, will be found a better canoe all round—faster under paddle and sail, with the wind free, a better sea boat, and of greater carrying capacity.

I may here observe that I had a hatch, such as I described in my last paper (*FOREST AND STREAM* May 7th), fitted to my boat this season, and find it to answer admirably. It is quite water tight, easily shipped and unshipped, and cannot incommode the canoeist in the event of an upset, as it is not made fast to the canoe in any way. The

size of the sail will vary with the taste of the canoeist and his skill in managing his sail under it. Too much sail should be avoided, especially by a beginner. To "get on swimmingly" is not a desirable thing on a canoe cruise. I give the dimensions of my lateen sail as a guide. Head, 6 feet 9 inches; foot, 7 feet 4; after leach, 6 feet; fore leach, 9 inches. The yard is slung exactly in the middle, and the foot is hooked to an eye screwed into the side of the mast 18 inches from the fore leach. This sail is too small for my canoe, and might with advantage be a foot higher. The gear should be as simple as possible. For the lateen sail two strings only are required, halliard and sheet; the halliard passes through a shreeve hole at the top of the mast, and is led aft through a small brass pulley at the side near the deck; the sheet is made fast to the boom at the foot of the sail, where it will least interfere with the paddler, and hitched to a cleat on the deck close to the paddler's seat. No rudder is required; the paddle is the best and safest steering apparatus, it is advisable to have a small O shaped rowlock fitted to the gunwale abaft the paddler's seat, in which to rest the paddle when steering.

The "sliding spreet" rig has been recently described in *FOREST AND STREAM*. I believe it has been quite discarded in England, and it is far too complicated for a small craft like a canoe. A Ringleader rigged with a long lateen sail, such as I mentioned, would leave a Nautilus out of sight with her three sails, going with the wind abaft the beam.

The outfit I generally carry with me when going on a cruise of any length, is the following:—1st. An oblong waterproof bag, about 3½ feet long and 14 inches wide; into this I put a change of clothes, blanket, etc., and it serves as a cushion to sit upon. 2d. A copper locker, about nine inches square, which holds a supply of tea, cocoa, sugar, biscuits, and similar things that would be spoilt by wet; this fits into an opening in the deck behind the cockpit, so as to be capable of being removed and carried separately when a portage is necessary. 3d. A small tent, like a tent d'abris, which weighs only 3½ pounds, waterproof sheet, also very light, a fisherman's waterproof coat and trousers, small hatchet and fishing basket; these can be packed into and strapped on to the fishing basket, and stowed underneath the deck in front of the stretcher. A fishing rod and landing net stick are made fast to the bottom of the canoe, close to the flooring boards, and a small kettle, tin plate, and frying pan are stowed in behind the locker and made fast to the kelson by a strap. When a portage is necessary, the heavy gear, as waterproof bag, locker, etc., is taken out of the canoe, strapped together, and carried across at one trip, then the canoe is taken on my back and carried over.

Sleeping in the canoe is to be avoided, if possible; it is very uncomfortable for one thing, and strains the craft and causes her to leak for another. A much better plan is to carry a small cotton tent, and make a camp in the regular way, cutting spruce boughs to sleep on. In this country there is no difficulty in getting fire wood, so the necessity of carrying an elaborate "euddy" with spirit lamp, etc., is done away with. I subjoin a description of a cape tent invented by Professor Parkes, of the Army Medical School, Netley, England, which, I believe, will be found very useful for canoeists and travellers. This consists of a quadrangular piece of cloth or canvas, waterproofed, which is 7 feet 4 inches long, and 2 feet 2 inches broad; on one of the long sides is a row of tapes or buttons, and on the other side are two triangular pieces, slightly rounded, and each measuring 3 feet 8 inches at the base, and having a height of 3 feet; along the inner edge of each is a row of buttons. When used as a cape the triangles fall in front, and are buttoned; the quadrangular piece covers the shoulders, and the two ends being brought together behind and buttoned a cape is formed which completely shelters a man of usual height from the neck to the middle of the leg. To make a tent, two of these capes are joined together and stretched over two stakes, connected by a ridge pole, or cord; the mast, paddle and yards of the canoe might be made to serve for these. The tent is thus composed of a quadrangle, 4 feet to a side, and of two triangles, each 4 feet across, and 2 feet from base to apex. The total length is therefore 8 feet, but only 7 feet are available. The weight of each cape would be about 2½ pounds.

NOTE.—Since writing the foregoing I have seen in *FOREST AND STREAM* of May 7th a letter signed "K. Newman," questioning my criticisms of the Nautilus type of canoe. The craft of this type that I am acquainted with are built of English oak, and I estimated their weight, by handling, etc., at 100 pounds at least. Those that he refers to are probably built of pine or cedar, and so weigh much less. The oak canoes also draw more water; but even 6 inches is too much for a canoe to draw. The "Passenger Bird," with a full cargo, does not draw more than 4. As for the rig, unless I am greatly mistaken, Mr. Newman would find his canoe sail better with a fair or leading wind if he had all his canvas combined in one piece, as in a lateen or lug sail, than divided into three sails, and it would certainly be much more handy to set, shorten, or take in. As to the sailing powers of the Nautilus, would Mr. Newman sail a match with his canoe against a 12 foot, centre board boat, cat rigged, round a course, with a fair amount of beating to windward? I should like to see a match of this kind tried, and the respective positions of the canoe and boat at the finish.

Halifax, Nova Scotia, June 6, 1874.

C. M. D.

PHILADELPHIA, July 6th, 1874.

EDITOR FOREST AND STREAM:—

The Fourth has come and gone, and instead of the record of races that will come from so many localities we have only to regret that you could not have been numbered among the many crews who breakfasted at "Strawberry Mansion," "The Falls," or "Wissahickon."

Bights, sixes, fours and singles carried up goodly parties, and the consumption of waffles, catfish and coffee was immense. As an appetizer, rowing has no equal. By-the-bye, September will be an eventful month here, for in addition to the Navy Regatta of the 26th, several single scull races are on. It is rumored that the redoubtable man Schmidt will pull against Little Joseph, of the Quaker City (though in justice to Mars the challenge comes, or will come, from Leibert), and it is more than rumored that Schmidt and Larens will try it about the same time. It is to be hoped the parties will get together and put an end to the discussion as to who can make a boat travel best.

The Undine's Club Regatta seems to hang fire, and will not come off before September, perhaps not then. This is to be regretted, as they have no lack either of boats or men. It is to be hoped that some one will represent us at Troy in the National, for there is no reason why the Quakers, Pennsylvanians and Vespers should not send their fours.

Commodore Ferguson goes to Europe on the 16th, and will bring back some boating ideas for us from beyond the seas.

"SCULLS."

The Horse and Course.

Third day at Monmouth Park, July 9. First race, the Selling Race, all ages; distance one and a quarter miles, eight horses starting. B. F. Carver, Quits, Kadi, Theodora, Wizard, Conductor, Utica and Visigoth. Won by J. Coffee's Carver in 2:13½. The Monmouth Oaks then followed, for three-year-old fillies, one and a half miles, six horses, Bonaventure, Bannerette, Countess, Ida Wells, Regardless and Christine. Time—2:45. The Mansion House Stakes were then in order. The interest in this race was not very great, because it was evident that it was an easy thing for Tom Bowling, only two other horses running against him, Whisper and Ransom. The Mansion House Stakes is for four-year-olds, two and a half miles. Tom Bowling was good enough to take the lead whenever Swain, his jockey, wanted to let him have his head, but was harder to check. Just at the finish, when Whisper, by no means an ordinary horse, was given a full burst of speed. Tom Bowling going easy, was suddenly forced into a rapid gait, and won in 4:53. A hurdle race, two miles with eight hurdles concluded the racing, six horses entered. Won by L. A. Hitchcock's Limestone, in the very good time of 3:53½, by two lengths. Limestone is a four-year-old.

Fourth day, July 11th, at Monmouth Park, the July stakes for two-year-olds, three quarters of a mile, nine horses entering. Won by McGrath's Calvin. Time—1:38½. The Four Mile Race then followed, for all ages, five horses, Arizona, Whisper, Fellowcraft, Jury, Shylack starting. M. A. Littell's Fellowcraft won by ever so many lengths, in 7:43, with Whisper a bad second. The mile and an eight dash for all ages, Atilla, Survivor, Vandalite, Carver, Artist, Woodbine and First Chance starting. Won by P. Lorillards' Atilla, in the very good time of 1:58, beating Survivor by a length and half. The mile and a half race then was run for. Won by Sandford's Radi, in the nick of time only, in 2:43½.

—On Wednesday last, at the Deerfoot Driving Park, Ladie Annie won an undecided heat and the race in 2:38½. The fact is remarkable inasmuch as she ran eleven heats in two days, winning two races. On the same day for trotting horses, Phil O'Neil won in 2:41½, 2:45½, 2:46 and 2:45. For 2:30 horses Molsey, won in 2:30, 2:37½, 2:39½, 2:44½, and 2:35½.

—At Indianapolis on July 8th, second day of races for 2:28 horses, mile heats, the first race was won by Kansas Chief—Time, 2:31, 2:32½, 2:35, 2:33½, 2:33½. The second a pacing race, best three in five, was won by Sealskin. Time—2:22, 2:29½, 2:26½, 2:30, 2:32. Over the same course on the 9th, a fine race was won by Robert Hunter, best time, 2:36½.

—Indianapolis July 11th, trot for five-year-olds. Won by General Grant. The "Free for all" trot, Goldsmith Maid, Red Cloud and Fullerton starting. Won by Goldsmith Maid. Time—2:23.

Indianapolis races of July 13. The race for 2:45 horses, was won by Ned Allen. Time—2:36½, 2:40, 2:39½, 2:41. The next race for 2:22 horses, was won by Red Cloud. Time—2:30, 2:26, 2:23.

WALKING HORSES.—A writer in the *National Live Stock Journal* thus dwells upon the importance of training horses to walk fast:—

"One of the most desirable and valuable gaits for a horse is a walk, and it should be the aim to first develop this gait in the handling of the colt. The good walker will always make good time on the road when a day's journey is to be made, without wearying himself, while the slow mope must be constantly kept on the trot if the time is to be made. A horse that will walk five miles per hour will go as far in a day, confined to this gait, as an ordinary horse can be driven when kept half of the time to the trot, and with much greater ease to himself. If one half the pains were taken by the youngsters' boys to make fast walkers of the youngsters on the farm that is usually taken to make them trot, the result would be much more beneficial, and we would find plenty of teams that could do their five miles an hour with ease. But instead of this, as soon as the colt is bridled, the sole aim of 'the boys' is to make a trotter of him, and both gaits are spoiled. Make the colts walk, boys; make them extend themselves in a long, sweeping, square walk, and don't be satisfied with anything less than five miles an hour. When he gets to trotting he will go all the faster for this preliminary training to the walking gait; and if he cannot trot fast enough to beat Dexter or Goldsmith Maid, or Occident, he will have a gait that is invaluable for business purposes. We hope to see more attention paid to fast walking than heretofore, and we respectfully urge upon agricultural societies the importance of offering liberal prizes for walking horses at the fairs for the coming year."

Ask your Dealer, or send direct to our

works for a supply of PURE TOBACCO

VIENNA, AUSTRIA, Nov. 30, 1873.

Messrs. Wm. S. Kimball & Co.:

SIR:—A friend of mine sent me, with a transport
of Indian Skulls, two pounds of "Vanity Fair," which I declare
to be the best Tobacco I ever smoked. We have very good
tobacco in Vienna—Turkish and Hungarian, but "Vanity Fair"
is the King of all, by its aromatic flavor and the right sort of
strength. My friend in New York got an appointment in
California, by that reason I apply immediately to you, begging
you to send me for the enclosed ten dollars, a supply of "Vanity
Fair," and send with the next steamer to Germany. If there
is a German firm that sells your excellent "Vanity Fair," I
beg you to enclose me the address.

119 Maiden Lane, 20 & 22 John street, N. Y.
BREECH LOADING GUNS
A SPECIALTY.

We would call the attention of the public to our large assortment of

Breech-Loading Shot Guns,

Manufactured by the following celebrated makers: Messrs. W. & C. SCOTT & SONS (winners at the International Gun Trial of 1873); P. WEBLEY & SON, W. W. GREENER, WESTLEY RICHARDS, J. HOLMES & SONS, and other makers.

A full line of fine
PISTOLS AND RIFLES CONSTANTLY ON HAND.
DIXONS & HAWKLEY'S SHOOTING TACKLE.
To insure good shooting from Breech-loading Guns, we would recommend the use of the

STURTEVANT BRASS SHOT SHELLS,
manufactured by the Union Metallic Cartridge Co., Bridgeport, Conn. These shells are the cheapest and best in the market, can be easily re-capped with ordinary caps, without the use of the implements necessary in priming all other styles of shells.

BUSSEY'S PATENT GYRO PIGEON AND TRAP,
WITH CASE, AND 100 BIRDS.

Black's Patent Cartridge Vest.

This Vest affords the best arrangement yet in rying cartridges. The weight is ted that it is tridges can be heads down in of great impor- shells are used them with the of the shot off- forward, when result.
In ordering send measurement around the chest. Price \$7.50.

AGENTS FOR THE
Union Metallic Cartridge Com-
pany's Ammunition,
WARRANTED THE BEST IN THE MARKET.
SEND FOR CIRCULAR.

In offering this Trolling Bait to the public the mann facturer feels confident he has brought this artificial bait to such perfection that it needs but a trial to establish its superiority over all others for catching Bass, Pike, Pickerel, Trout, Salmon Trout, Muska- longue, &c. Three sizes made—No. 20 for fish under 3 pounds weight; No. 21 for fish under 10 pounds, No. 22 for very large fish. If not to be found at your fish- ing tackle stores, these Spoons will be forwarded by the manufacturer by mail. Price \$1.00 each.

Weight, 28 inch, 8½ lbs. 30 inch, 8¾ lbs. 2¼ inch Drop. 14 inch Stock.

DECARBONIZED STEEL BARREL.

We are now prepared to furnish these Guns, 28 and 30 inches, No. 12 guage, at \$45. Discounts to the trade only. Will have Twist and Laminated Barrels at \$60 and \$75 about July 1st, 1874.

Hegeman's Patent Portable Folding Boat.

For use as LIFE-BOATS, LIGHTERS, Dingies, Do- rys, on board Steamers, Yachts and other Vessels. Also for Sportsmen, Tour- ists, Trappers, Exploring Expeditions, Parties Camp- Out, &c. &c.

These safe and perfectly por- table boats will admit of the roughest usage. A very light, strong and durable frame of ash or other tough wood, with canvas cover, and can be folded in one-eighth space, for trans- portation, and carried in a light buggy wagon, on horse- back, or by single person, and can be unfolded ready for use, in three minute's time. Boats neatly foded, packed and shipped by ex- press anywhere at same rate of freight as ordinary goods.

JOHN HEGEMAN, Ballston Spa, Saratoga Co., N. Y.

This arm was submitted in competition with over one hundred different systems, American and Euro- pean, to the Board of United States Officers, appoint- ed by Act of Congress, 6th June, 1872, for the pur- pose of selecting the best arm for the service, and of which Brig. Gen. A. H. Terry was President. It suc- cessfully passed through all the tests.

The following is the report of the Board:
"Resolved, That the adoption of magazine guns for the military service by all nations is only a question of time; that whenever an arm shall be devised which shall be as effective as a single breech-loader, as the best of the existing breech-loading arms, and shall at the same time possess a safe and easily manipulated magazine, every consideration of public policy will re- quire its adoption.

Resolved, further, That the experiments before the Board with the Ward-Burton Magazine System have so impressed the Board with the merits of this gun, that they consider it as more nearly fulfilling the con- ditions above specified than any other tried by them or of which they have any knowledge, and it does recommend that a number of magazine muskets be made on the plan for further trial in the field." (See Ordnance Report.)

We are now receiving orders for these guns, and due notice will be given in this paper when they are ready for delivery.

The following is our scale of prices: Special Maga- zine for large game, carrying from 3 to 8 cartridges, 70 to 85 grs. of powder, 350 to 400 grs. of lead, 8 to 10 lbs. weight, from \$60 and upwards, according to finish. Special Long-range Magazine Rifle for Creedmoor shooting, 90 grs. of powder, 480 grs. of lead, carrying 3 to 8 cartridges, weighing 10 lbs., from \$100 and up- ward. Magazine guns for general use, carrying 3 to 9 cartridges, 60 grs. powder, 350 grs. lead from \$40 and upward. Single Breech-Loader, Creedmoor shooting, for long range, 90 grs. powder; 480 grs. lead, from \$60 and upward. Single Breech-Loader for general use, 6 to 7 lbs., 60 grs. powder, 350 grs. lead, from \$30 and upward. The calibre of all our rifles, unless otherwise ordered, will be 45-100 in.

THE GREAT PRIZES.

OF THE

Fourth Gift Concert

OF THE
Kentucky Public Library

WERE DRAWN AS FOLLOWS:

The first prize of \$187,500, the capital prize, by clubs in Memphis, Tenn.

The second gift, \$75,000, was paid to State Bank, Madison, Mo., J. H. Wakefield and A. L. Sims, of Trenton, Ky., H. H. Bollinger, Pembroke, Ky., P. W. Dooner, Los Angeles, Cal., W. G. Byerly, Portsmouth, O., Flint & Chamberlain, Waco, Texas, and others, the tickets having been sold in coupons.

The Farmers' National Bank, of Richmond, Ky., drew the half of the third prize, \$37,500. Wm. E. Oates, Vicksburg, Miss., J. M. Copeland, Franklin, Ky., Armstrong & Sawyer, Gransburg, Ind., each one-tenth. The remainder was held in clubs.

The first prize in the third drawing was all in one ticket, and owned by L. H. Keith, Esq., Kingston, Mass., to whom was paid \$100,000 in cash.

The Fifth Gift Concert,

which is positively the LAST THAT WILL EVER BE GIVEN UNDER THIS CHARTER, will come off in Public Library Hall, at Louisville, Ky.

FRIDAY, JULY 31, 1874.

\$2,500,000

divided into twenty thousand gifts, will be distributed among the ticket-holders.

W. W. GREENER'S

PATENT TREBLE WEDGE

Fast Breech Loader

Indestructible by Gunpowder.

This gun is specially designed to meet the require- ments of American sportsmen. It will stand a larger charge of powder, and shoot stronger than any other system. For duck and pigeon shooting these guns stand unrivalled. The action is simple in construc- tion, quick and easy to load. They may be inspected this season at all the principle gun stores in the Uni- ted States. Prices moderate.

The second edition of "Modern Breech Loaders, Sporting and Military," will be shortly published by W. W. GREENER,
july 2 St. Mary's Works, Birmingham, England.

And published under the auspices of the Command

Steam Ship Co. and Brooklyn Yacht Club.

The Compiler has the honor to announce to profes-

sional Mariners and Yachtsmen that the above is now

in press, and will shortly be published. Price \$2 50.

The Life Saving Stations include the new districts.

The Tide Tables will be very extensive.

The Compilation has been carefully made, and is

complete and accurate.

The artistic and typographical work will be in the

best style.

Subscribers remitting the price of the work, with

name and address, either to the Compiler, to John

Filmer, 292 Broadway, or to FOREST AND STREAM

Publishing Co., New York, will have a copy forward-

ed as soon as published, mailed free. jly2

SHARPS'

Breech-Loading, Metallic Cartridge

Military,

Hunting,

and Target

RIFLES.

EXCELS ALL OTHERS

—IN—

Accuracy, Strength & Safety

No Premature Discharges Ever Occur.

Special attention is called to their LONG RANGE

RIFLE, weighing 10 lbs., for target practice. This

rifle won the AMATEUR CLUB MEDAL, at Creed-

moor Range, New York, three times, making eighty-

one points out of a possible eighty-four—best record

ever made on the Range. At same Range, Fall meet-

ing, in "All Comers Match" 500 and 600 yards, 75 en-

tries and 10 prizes, the SHARPS' RIFLES took five

prizes with seven guns. At the Opening Meeting,

Creedmoor, June 6 1874, Sharps' took four out of six

prizes in the match for military rifles at 500 yards;

the first and second prizes being won with it by scores

of 27 out of a possible 28.

Every Rifle Warranted a good shooter;

Calibres 40, 44 and 50-100 in., of any length

desired;

Charge of powder, 50 to 100 grains;

Weight of balls, 220 to 540 grains;

Stocks, plain, also pistol grip and checked;

Sights, plain, globe and peep, Vernier with in-

terchangeable front sight and wind gauge.

Price, from \$35 00 to \$125 00.

Every variety of ammunition for above guns con-

stantly on hand. Send for circulars

OH! WHERE SHALL WE GO?

Oh! where shall we go on the bright days of summer,
To search for new pleasures that out of reach seem,
And bring back before us the scenes of our childhood,
That long since have vanished and gone like a dream?
The sun of sweet summer, the stars of sweet summer,
Glad hours when we roamed by the Forest and Stream.

Oh! where shall we go on the bright days of summer,
And search by the banks of some river or stream,
To find the lost loved ones that long have departed,
Away, far away, where the little stars gleam?
The sun of sweet summer, the stars of sweet summer,
Gaze down o'er their graves by the Forest and Stream.

St. John, N. B.

J. NEWTON WILSON.

For Forest and Stream.

The Salmonidae of the Pacific.

THIS family is more extensive in north-western America than in any other portion of the world, and many of the species are so much alike that it requires much more than a superficial scanning to distinguish them, and give each its proper cognomen, for when doctors disagree, as many of the fish doctors do in their technical diagnosis, it must be hard for an apprentice to give a perfect one, or to agree with all the ichthyæsculapians.

The salmon run in the rivers of Oregon and Washington Territory at all seasons of the year, each species having its own time for entering the fresh waters. Those that enter in spring and early summer are, however, the best, and few of the later arrivals are deemed fit for the table by the whites, though the *siwash*, as our noble red men are called, eat all varieties, being, apparently, indifferent to epicurean qualities. All they care for is that the fish is capable of furnishing pabulum to the gastric regions, for they will never sacrifice the ventral orifice for the sake of the palate. The first of the family to visit the Columbia River is what is known in our vernacular as the spring silver salmon, and called by the Indians the *tyee*, or chief salmon. This is the *salmo gairdneri* of Richards, and is the best species of the entire family in every essential quality necessary for the table or commerce. It is the only variety exported from Oregon, except in a few isolated instances when an autumnal variety, rather large and somewhat lean, is prepared for the markets of the Sandwich Islands. The *S. gairdneri* begin to arrive about the middle of April and last through May and often up to the middle of August. They enter in myriads, and very often are so dense as to crowd each other ashore. The waters seem to be fairly alive with them from near the surface to the muddy bottom, and they appear to be as numerous in one part as another. The larger and older fish are at the head of each school, and they lead their hosts over many a weary mile, jumping cascades, hurling themselves down steep declivities, wriggling and twisting themselves over shoals, and finally selecting the grounds where their numerous followers are to indulge in their watery hymen. These leaders bear the marks of many dangers passed, when they reach the spawning grounds, the snout of the greater portion being worn away, while they are often minus an eye, and in most instances deprived of all their adipose tissue. For this reason all the fisheries are situated near the mouth of the Columbia, or at least only a few miles from it, as the fish are in the best condition when fresh from salt water. The tribes along the Fraser River think that the salmon select the old and experienced ones as leaders when about to make their hegira for the spawning grounds, hence they term the decrepid, maimed, and attenuated, but brave and persevering pilots, the *mee-oo-tees*, or chiefs.

When these have found a locality suitable for the deposition of their ova, they close toward the shore; the female then inclines her head against the current and by using the caudal retains her position long enough to deposit the eggs in the nest selected. This done she darts off suddenly and her place is assumed by the male, and when he has dropped

the impregnating milt he also shoots off to join his companion. In this way each couple succeed each other with the greatest regularity until they have accomplished that mission which a blind instinct has made them dare all dangers to perform. What becomes of them after, may be conjectured from the fact that millions of them die from exhaustion at the heads of streams, and that they furnish a feast that lasts for several months to the vultures, eagles, fish-hawks, fish-crows, gulls, and several species of carnivorous quadrupeds. It is supposed that the salmon do not eat any food after entering fresh water, and this fact coupled with their severe toil, readily accounts for their emaciated condition and the death of so many of them after having fulfilled their mission. This species when it first enters fresh water is about as handsome a type of the ichthyic order as one could desire to see. The head of the adult is large and pointed, and about one-fourth the length of the body; the snout is cartilaginous; the caudal deeply cleft, and the dorsal outline arched. The general tint of the back is a bluish-gray; sides ashy-gray with a silvery lustre; the back above the lateral line is studded with irregular rhomboidal spots, some of them ocellated; the scales are large, and the branchial rays vary from fourteen to twenty. This brave and handsome fish is the best known of the entire family, as its size, gastronomic quality and high commercial value have made it known in the four quarters of the globe. The usual mode of catching it is with traps or weirs, and seines, or nets; it is never to my knowledge taken with a hook.

The fishing season usually commences in April, and from that time until August the Columbia is a scene of activity where the fisheries are situated. These establishments, which are built in a shady nook, are composed of a long two-story building, and are divided into several compartments. One is devoted to the manufacture of barrels, another to the making of small round cans; still another is reserved as a cook-house, and here are situated the immense boilers in which the fish, when packed in cans, are cooked. In front of the house, and tied to the wharves, is a large number of Whitehall boats, in which are placed the nets, seines and other paraphernalia necessary for the capture of the fish. Out in the greenish waters may be seen several more boats, their brawny, picturesque looking crews engaged in hauling the net or depleting it of its contents. Farther in, toward the shore, another party may be observed clearing out a weir and pitching the fish into a boat where they are summarily killed by striking them on the head with a club-shaped bough selected especially for that purpose. These weirs are generally the property of a party of men who sell their catch to the canning and barreling establishments at so much per fish. The usual price is from twenty to thirty cents; and as the catch varies from 50 to 2,000 per night it will be seen that the business must be profitable. The latter number is not, however, of very frequent occurrence, yet a catch will sometimes exceed even this.

In seine fishing the larger portion of the work is done by day. The net being placed in the stern of the boat, one man on shore holds on to a rope attached to it; the boat is then pulled a certain distance out on the river, paying out the net as it progresses until it meets the current, when it swings around in a semi-circular manner and then moves to the shore with the other end. The seine is then pulled ashore gradually, and despoiled of its contents.

The third mode of fishing is confined entirely to the night, and the darker it is the better. The nets used are generally from 120 to 175 fathoms in length, two and a half fathoms in width, and have meshes which measure from six to eight inches diagonally. The net is thrown in the channel which the fish usually take, and is carried down the river by the current from three to five miles. It is then hauled in on the boats which accompany it, and to which it is attached by ropes, and after being cleared of the spoils is again thrown into the water. The fish caught in these nets are very large, as the small varieties can pass through the meshes. To eastern eyes, the pile of magnificent

salmon which lie in front of a fishing establishment in the morning, seems wonderful, for few of the number weigh less than twelve pounds, and some will exceed forty. The catch of a net varies from fifty to three hundred of a night, and often it will exceed the latter figure. During the month of June, when the annual freshet brings to the Columbia a large amount of sediment to darken its waters, the gill nets are worked both day and night, as the fish cannot then see them. On such occasions two gangs of men are employed, one for the day and the other for night work, for as the season is short no time is to be lost; hence, spirited activity is manifested at every establishment. When the fish are counted on the wharf they are handed over to Chinamen. One of these gangs, with a dexterity acquired by long practice, strikes off the heads with large knives placed on pedestals, cuts open the ventral region and clips off the cauda; another attends to washing and cutting the fish into pieces of a pound each, while a third is packing these into cans, boiling them, or soldering and preparing the cans. Some salmon are smoked, and some are salted and barreled, and when these are selected other parties of Celestials attend to their preparation.

The mode of canning the fish was formerly considered a great secret, and no one around the fishery who knew it was allowed to divulge it, but now that fisheries are quite numerous the ban has been removed to a certain extent; yet, the greater number do not care, even now, to tell all they know about the matter. The system, as far as we could learn, is to put a piece of salmon weighing a pound into a can, to add to it some spices, then close up the can, except a small hole on top, put it into a boiler filled with boiling salt water and keep it there half an hour; it is subsequently boiled in fresh water a certain time, then again in salt water for half an hour; the can is then taken out, soldered air tight, piled up with others, and after a few days is ready for shipment. This mode of treating the fish makes it very palatable, so it is purchased largely in England and the Continent of Europe. China and the Sandwich Islands are also becoming purchasers, and, ere long, promise to be excellent customers. The salmon captured in 1873 probably reached 12,000,000 pounds, of which about one-fourth was barreled or sent to market fresh, the remainder being canned. The total value of all caught was about \$1,000,000, but from this we may deduct the fish sold fresh in the markets of the State. This industry is capable of unlimited extension; in fact its only limit can be the capital invested, for the fish are numerous enough to employ thousands of large establishments. The number that die annually is sufficiently great to feed the population of the United States; and were this food now wasted prepared for consumption by capital, salmon would be abundant in the homes of the poor throughout the country, instead of being, as now, a rare luxury.

The species that earliest visits Puget Sound is called *satsup* by the Indians of Nisqually, and *semetleek* by those tribes on the headwaters of the Columbia. We are inclined to think that the latter is the species described, and also the *satsup* of the Sound Indians, though of this I am not positive, as I have not examined it. The fisheries on Puget Sound are few in number, and do not commence work before June, so at the time I last visited them I could not find any salmon.

The tribes along the Columbia and its tributaries catch the salmon by spearing them, or else they use a scoop-net at each little cascade, and these are numerous enough in the rivers of Oregon and adjoining Territories. To see a number of Indians, dressed in the garments of nature, perched on a cliff or rock in the seething river, and hurling with almost unerring accuracy the glittering spear into the mass of salmon that toss and leap or play beneath them, and bring it back laden with the rich spoils of the water, forms a scene picturesque in the highest degree. Their villages are always close at hand during the fishing season, and are the abodes of feasting and merry-making, for this is the great harvest of the lords of the sage plains. The fish when caught are cut into slices by the squaws and

dried in the sun, then packed away for winter use. Were the Indians deprived of this means of livelihood I think all would die of a broken spirit, if not of starvation, for dried fish has so long been an aliment with them that they are impregnated with its odor from hair to moccasins. It is to them what the buffalo is to the Sioux and Pawnees, or crickets and grasshoppers to the Diggers of California. The tribes of the Sound capture large quantities of salmon by trolling, a style of fishing quite interesting to those fond of their case. They first fasten a bait, usually a small herring, to the hook; six or seven feet from the latter is tied a stone which is used as a sinker, and this keeps the line from six to fourteen feet beneath the surface. The fisher then paddles his canoe quite slowly and noiselessly, trolling with a jerking motion at the same time with his left hand. In this way he manages to catch a boat load in a short time, for each salmon weighs from five to thirty pounds. If one would thoroughly enjoy this sport he should be out a couple of hours before day-break and have a *sicash* to do the paddling while he hauled in the fish.

The next visitor of this family calls in May and June. It is known as the "blue-back" along the Columbia, and the "weak-toothed" salmon on the Sound; but to science it is familiar as the *salmo paucidens*. The Indians along the coast denominate it the *quanich*, or second running salmon; and use it extensively as an article of food. It bears no comparison with the *S. quinnat*, so the fisheries devote but little attention to its capture. Its general characteristics are a straight dorsal profile, a forked caudal, teeth scattered and feeble—hence name—fins and tail unspotted. The back of the head and body is a bluish-gray, and the belly is white. Its average weight is between three and five pounds. It is closely allied to another species, the *S. argyreus*, yet is readily distinguished from it, even in the water, by its reddish spots or marks. Though frequenting all the tributaries of the Columbia, we have not heard that it ever took a fly, hence, conclude that it offers but little sport to the angler.

The preceding is followed by a very handsome and highly edible species, the *salmo tsupitch*, or white salmon, which arrives in September. Its specific name is of Indian origin, it being known to the Chinooks as *tsupitch*. Lewis and Clarke in their travels called it the silvery-white salmon, a name not inappropriate. Its distinguishing characteristics are a small conical head terminating in a pointed snout. The commissure of the mouth is slightly opaque; the dorsal profile rises gradually to the origin of the first dorsal fin, declining thence to tail, and the caudal is forked. The back of the head and body is studded with oval and circular spots, but the sides and fins, including caudal, are free of them. The teeth are small and sharp; few on the anterior end of the vomer, but the tongue has a double row. It is deemed an excellent fish for the table, so large quantities are sold fresh by the Columbia River Indians.

Another species highly prized is the *salmo truncatus*, or square-tailed salmon, so called from its truncated caudal. The Indians capture it extensively in the salt water with a baited hook, and spear it in the rivers. It bites quite freely along Puget Sound, so makes capital sport, as it weighs from ten to twelve pounds, though the average is less. This variety approaches closely the *S. trutta* of Agassiz, mentioned in his "*Histoire Naturelle des Poissons d'eau douce*." It has quite a small, square tail; a small head and small teeth, and the dorsal profile is arched. The color of the back and dorsal fins is a bright blue, spotted with black on the head and fins; the lower region is a silvery-white, but below the lateral line it becomes dusky, and the lower fins are pale and unspotted. To show its fine form I give a measurement made of one captured at Muckilteo, a fishing hamlet on Puget Sound:—

Upper measurement.—Length, 31 inches; head from tip of snout, 4 inches; nose to first dorsal fin, 13½ inches; nose to adipose dorsal fin, 23 inches; length along lateral line from nose to base of tail, 30 inches.

Lower measurement.—Nose to tip of tail, 32½ inches; nose to pectoral fin, 4 inches; nose to abdominal fin, 15 inches; nose to ventral, 21½ inches; nose to lower caudal rays, 28 inches; girth anterior to abdominals, 16½ inches.

It will be seen that very few excel this in outline and girth. It reaches the Columbia by August and the Sound a little later, and runs up the tributaries of both from that time to the middle of December. The Indians troll for it with a clam, or herring bait, and capture large numbers. It ought to make excellent angling, but then one must be in a boat or near the mouth of a river, and then I doubt its taste for flies, though its palate might be tickled enough to induce it to try them. It would certainly be capital sport if it could be done.

Another species, called *quachts* by the Indians, enters the Columbia in June in small schools. It is doubtless the *S. gairdneri*, though also called a spring salmon. It differs from its namesake, the *S. quinnat*, in its rounded instead of pointed muzzle, in its want of a toothless extension of the lower jaw anterior to the teeth, in its shorter and thicker head, and having a straighter dorsal outline. The back of the head and body is a bluish-gray, the sides ashy-gray, the belly is white and the tail spotted dark. Its weight ranges from five to twelve pounds; and the flesh, which is whitish, is quite good. It ought to be an excellent variety for commerce.

The *salmo gibbsii*, of Suckley, visits us in early spring and late in December. It is plentiful in all the streams, and is known to the inhabitants as salmon and mountain trout. It ranges from sixteen to twenty-two inches in length and weighs from three to seven pounds. It is closely allied to the white salmon, notwithstanding that it is known as trout. It bites readily at a hook, and makes capital sport, for it will take anything from a gaudy clad grasshopper to the sombre coat of a brown daddy-long-legs. The small rivers are the best localities to angle for this species, as it seems to have a preference for the cool, clear streams east of the Cascade Range. It is a very game fish. The profile of the body is subfusiform, the head is small, snout rounded, and the teeth are few, especially on the labials. The color of the back and head is an olive green dotted with black spots.

The *salmo confluentus*, which arrives in Puget Sound about the first of June, is the largest of the species frequenting the locality, as it weighs from eight to thirty pounds, though the average may be placed at from fourteen to seventeen pounds. It is speckled, with small black spots, and the scales are rather dark.

The hook-nosed salmon, (*S. scouleri*), frequents the fresh waters emptying into the ocean from September to January, but it is not caught except by the Coast Indians. After tarrying some time in rivers it becomes emaciated

and myriads die from exhaustion or some other cause. It derives its name from the outlines of the snout. It has an arched profile, and the teeth are strong, though irregular. The back, which has a leaden hue, is unspotted, and the belly is white, the branchial rays vary from 10 to 14.

The most peculiar looking of the salmonidae is the hump-backed species, (*S. proteus*), and it is no less singular in looks than in habits. It arrives in the fresh waters of this region every alternate year, and runs in such vast schools as to compare with the *quinnat*. It arrives, as a general rule, about the first of September, and for a couple of months rushes into every little stream it can find. As it is poor eating, however, it is unmolested by fishermen, so the few that survive the anger and labor of spawning return safe to the sea. The hump, which is the sole property of the male, rises from his spinal column into a small tower of seven inches or more in height. He has other characteristic outlines also which render him a kin in beauty to the low life which we see in cheap prints. These are an upper jaw which closes over the under, large hooked teeth, close and sharp, and the lower jaw ending in a dilated knob. To carry the similitude further it is also useless except for Indian pabulum, and always wears a dirty look. It weighs on an average about ten pounds.

The spotted dog, or fall salmon, (*S. canis*), arrives on the coast in immense shoals about the first of September; but after remaining any length of time in fresh water it becomes covered with red blotches, unsavory and unpalatable. Immense numbers die annually; in fact it is supposed that few return to the sea. This is a question that should attract the attention of observers, for it would be interesting to learn the cause of the destruction of so many salmon when they only perform an act which all other living creatures above a few of the lower insects accomplish without injury to themselves. The motive for naming this species is evident when one beholds the large strong teeth imbedded in the strong jaws. Its colors are a dingy olive on the back, merging into a brassy hue on the sides; belly a dirty whitish. The average weight is about ten pounds; its flesh is white and insipid.

The red spotted salmon trout, (*salmo spectabilis*), is the handsomest species of its genus, and also excels all competitors in gastronomic qualities. It is splendid material for the angler as it is quick, strong and plucky as fish can be. It goes for a fly with a vigor most pleasing to the angler, and then dashes madly about when it has found that it was deceived by the looks of the innocent orthoptera, and swallowed more than it intended. The reel has to be used carefully yet freely in such cases. It is no unusual occurrence for a couple of anglers to capture from twenty to twenty dozen in an afternoon with a line in almost any stream where they can enter. We have seen Indians capture it in creeks as far up as the Great Falls of the Snake River and the headquarters of the Clearwater and Salmon Rivers in Northern Idaho, both with hook, line and traps made of willow wands. It seems to be partial to certain streams, though we have seen it in cool, shady, quiet lagoons, and in muddy and clear, tranquil and turbulent waters. It was supposed that this species was not a adromous, but this has been proved an error, for it enters the Columbia and Puget Sound about the middle of May. Immense quantities are caught in the latter place by both whites and Indians with hook and line, nets and traps. The *tenasmen*, as the Indian boys are called, do the principal fishing with the hook, using salmon-roe for bait, for the simple reason that they do not understand fly fishing. In the streams the trout will jump readily for angle worms, so that they offer good sport in almost every style of fishing from May to December. The body of this species has a subfusiform profile, but it is rather compressed, and the head is one-fourth the length of the body. The maxillary bone is curved and extends to the vertical line. The dorsal region, upper portion of flanks and tail are spread over with darkish gray spots; sides spotted with a light red, but silvery beneath; teeth sharp and more numerous on lower than upper maxilla; weight ranges from five to ten pounds; length twelve to fifteen inches. Several species of trout allied to this in looks and anatomical structure are found in numerous rivers and lakes of the north-west; yet they are specifically distinct though known as salmon trout.

With the preceding, in excellence for angling, may be classed the *salmo aurora*, placed by Girard in the genus *fario*, as he says that it possesses all the characteristics of salmon, differing from them only by having one row of teeth upon the shaft of the vomer, the remainder of the bones forming the upper roof of the mouth being toothless. We have seen this species caught near Clatsop Beach, late in June, having apparently just come in from the sea, as they were in excellent condition, though biting at a hook readily. It is caught in the streams and rivers from June to January.

The *salmo masoni*, of Suckley, which has a brownish-gray back, sides silvery-gray, fins ash-gray, the dorsal and caudal spotted, and the upper regions of the head and body sprinkled with irregular blackish spots, is quite common in the principal streams of Washington Territory and Oregon during the months intervening between June and November. It furnishes excellent fly fishing; but anglers at Vancouver and the Dalles seem to prefer the half-dried, gelatinous roe of the salmon, as it adheres readily to the hook. This fish seeks the quiet, cool and deep holes during the heat of the day to rest itself; yet, it seems ready to bite at almost any time.

The Oregon brook trout, (*fario stellatus*), furnishes good angling at all seasons, as it bites readily at fly, salmon-roe, clam, angle worm or even a piece of meat. It frequents nearly all the streams, and not being anadromous, is convenient at all times. Its habitat is the reverse of that of its New York congener, the *S. fontinalis*, for this loves the shady, clear unrippled pools, and not the seething cascades. Its spawning season seems to be about the middle of December. It is on its best condition in summer, when it weighs from one-fourth of a pound to two pounds. In January it has the anemic look consequent upon spawning, but a few weeks later some may be found filled with ovi, which they discharge freely as soon as touched. They are the companions of a black speckled trout east of the Cascade Range, where they are numerous. As a table fish, this trout ranks high. At the invitation of a friend I partook of a dinner last summer, in which the *stellatus* was the principal dish, as he had it prepared in a style to suit his own palate, and to preserve its flavor he ordered a certain class of wine. After the small, but exceedingly energetic party had devoured the trout and their accompaniments, washing them down with the best of Johannesberg, brought out specially to honor that mess of fish, we concluded, while enjoying the post-prandial Havana—also out for the

occasion—that Oregon trout could not be excelled in edible qualities, especially, if accompanied by Johannesberg worth \$10 per bottle, and given out *ad libitum*.

That your readers may know what this very pretty fish resembles, let me say that the body is subfusiform and elongated; head full and one fifth length of body; jaws equal; anterior margin of dorsal fin a little nearer mouth than insertion of caudal fin. The colors are a bright olive on the back; belly a light silvery white; head, body and fins profusely spotted with black; spots on body black, paler in centre and numerous; pectoral, anal and ventral fins a reddish orange. These enumerated are the principal variety of the salmonidae in the north-west; and they are abundant enough to furnish ichthyic pabulum to the inhabitants of the United States. A species allied to them, and of the same family, is the eulachon, (*thaleichthys pacificus*), which is very abundant and so fat that when dried it burns like a candle. There may be another variety or two of these salmon around Alaska where the waters are thronged with them; but those mentioned, except one or two minor species, are all known in north-western America.

MORTIMER KERRY.

For Forest and Stream.

THE BEAVER RIVER COUNTRY.

IN the latter part of May and early in June of the present year a party of four of us took a brief trip to the Beaver River waters of the "North Woods," in Lewis, Herkimer, and Hamilton counties. We went by way of Utica, New York, and upon arriving at the Martinsburg station on the Utica and Black River Railroad were transported by Mr. Lewis to his hotel at Beach's Ridge, two miles distant, the same evening. There we were comfortably quartered for the night, and the next morning Lewis drove in with us, sixteen miles nearly east by a fair road, excepting the last five miles, to "Fenton's," or "No. 4." Our original plan was to remain here, but upon our arrival the "wildness" which we had come to see and enjoy was not equal to our anticipations, and we resolved to reorganize and push on to Smith's Lake, nearly fifty miles distant by the route to be traveled up the river.

We spent the afternoon and evening at Fenton's in securing four guides and supplies, and in making explorations of the surroundings. Fenton's has recently been amply described in your columns by the genial ex-editor and experienced woodsman "P.H.A.," and I will not repeat what he has already told so well.

The next morning we walked eleven miles to Stillwater, followed over the wretched road by our guides and a strong wagon bearing our scanty luggage, and stopped for breakfast at the end of our walk at Wardwell's solitary sportsman's hotel. There we took boats and began our ascent of the Beaver River, which for making the most turns in the shortest direct advance surpasses everything I ever saw. The water was high and the current strong, and our progress laborious. When evening came we extemporized a camp at South Branch, where small trout took the fly with great alacrity. As the darkness came on, and we gathered from our fishing before the high blazing fire, and threw our weary limbs on our couch of fresh boughs, we discovered to our consternation that one of our party and his guide were missing. What added to the unpleasantness was that nearly all the supplies were in the missing boat. However, we had fortunately dined and supped together at Black Fly Point (named for the occasion with painful appropriateness), and, as to eating, only wondered where our breakfast would come from. At length, more calmly considering the situation, we smoked, and then six of us slept on a bed of boughs and under a fragrant roof of the same material.

Morning brought a solution of the mystery and the doubt upon which we had in a primitive way gone to bed, in the person of the lost guide himself. Missing the Branch he had rowed five miles further up the river to Little Rapids (where we all ought to have gone), and then first discovered his error. Without axe, blanket, or camp kit, there was the promise of a sorry night to both man and guide. Quickly crossing the short carry up the rapids, they were so fortunate as to find two gentlemen from Catskill encamped for the night, and to their bed and board the wanderers were invited. All this the guide related to us as we rubbed our eyes after our first sleep in camp for the trip, and then, since breakfast was only possible to us at Little Rapids, we broke camp and proceeded thither as rapidly as possible and breakfasted. The eating—enormous as it was on our part—was moderate and temperate compared with the devouring which we suffered in the hot sun from myriads of black flies. When we left home we supposed we were nicely and in a soldierly manner stealing a march on this enemy; but if the season was late he was not, and our first day on the river had revealed to us our deplorable error. Here, however, we nearly perished, and were only too glad to push on up the river out of the reach of the swarms of flies that seemed to stand guard on this vantage ground against all invaders of the sacred solitude beyond.

Passing up the river to the foot of Albany Rapids, we came to our first serious work, a carry of three quarters of a mile. Every man carried his load, but the guides were compelled to make two or three trips before we were ready to launch again. A row of two or three miles up the river over what must be excellent fishing ground brought us to Albany Lake, a favorite resort for deer, with low, marshy shores in the mair, but with some good camping ground on the east and southeast. Out of the lake and into the river again we finally reached another, and our last, three quarters of a mile carry, before undertaking which we dined. Crossing the carry we took the river again at Denison's Dam, below which, in the rapids, small trout eagerly took the fly. Two miles more of rowing brought us to Smith's Lake, and we soon landed and took possession of Syracuse Camp, picturesquely situated on the west shore, commanding a fine view of the lake, with its seven islands, its bluff and winding shores, and all its manifold beauties. Tired out, we soon went to bed, making shift as well as we could on some old marsh hay in camp, the rain having put dry boughs out of the question. An all night's drizzle penetrated our old bark roof, and we arose in the morning generally demoralized.

The day proved delightful. New bark and boughs were obtained, and repairs made. The camp is one well known among sportsmen on "this side" (a phrase the guides constantly use as opposed to the eastern and northern woods). It had been occupied during a portion of the winter by my guide's "pardner," of whom we heard enough. How a

man could live there in such a season was a question we were unable to answer.

Here we spent several days, fishing in the lake chiefly, sometimes down the river, and at the dam and the rapids below. Unfortunately, we were early, or the season was late, and the water high. Consequently, the trout were all over the lake, and our success was only moderate. But we caught some very fine trout, and all that eight men, with voracious appetites, could eat, fishing as leisurely as we chose. We fished by trolling, baiting with the red worm (carried in from Fenton's); also, by still fishing with the same bait, off from rocky points and at the mouths of inlets, and caught with the fly occasionally in the lake and on the rapids. Fly fishing in the lake, however, was a failure, both with us and the Catskill party encamped near us. Half pounders and upwards, and occasionally a salmon trout, were taken by trolling, but the largest speckled trout—fourteen and a half inches, and weighing a pound and a quarter, with many others a trifle smaller—were taken still fishing off the rocks and on the reefs. The speckled trout were in good condition, of a beautiful, rather dark color, and of as fine flavor as any I have eaten anywhere. Unfortunately, we were too early for that locality (last year I was too late at Meacham Lake and the St. Regis waters), and we did not have the glorious sport for which Smith's Lake has in times past been famous. I confess to as serious disgust with trolling for speckled trout as for pickerel, and nothing but necessity will drive me to such base fishing again.

Finally, early one beautiful June morning we started homeward, reaching Lowville, on the Black River Railroad, in the early evening of the second day in time for a train for home. Some of us walked sixteen miles that day—from Wardwell's to Fenton's, eleven miles, and thence, after dinner, five miles out of the woods.

The trip was quite laborious, but in the main very pleasant and satisfactory. Those who contemplate the like will be interested in knowing that parties of four are carried from Martinsburg or Lowville to Fenton's for \$6, and thence to Wardwell's for \$6. Riding is out of the question over the latter road (eleven miles) except as a last resort. Guides, with boats, charge \$3 per day and board. It is well enough to know beforehand what is a fair day's journey for a guide to make, and then to require its accomplishment. Supplies of all sorts may be purchased at fair prices, and camp utensils hired at large prices at Fenton's, but not blankets. Parties should write to Lewis, Fenton, or Wardwell, via Lowville, Lewis county, New York, for transportation, but probably can procure it at Lowville without difficulty, but at somewhat increased rates.

Syracuse, New York, June 18, 1874.

For Forest and Stream.

BLACK BASS IN FLORIDA.

HEARING great stories of the size of the black-bass, or trout, as they are called by the Floridians, in Spruce Creek, a tributary of the Halifax River, I left New Smyrna with a boat and guide on the 23d of April at 9 A. M. to test the truth of these fish stories. We sailed down the Hillsboro with a westerly breeze to the Inlet, called Musquito from the abundance of that familiar insect, and passing through a narrow gut between two sand-bars, we saw a large turtle of the logger-head kind, which having been crippled by the attack of a shark, which had bitten off half of one hind flipper, had crawled upon the sand. It weighed probably one hundred pounds, and could have easily been captured, but we had no use for it at the time. Crossing the Inlet, we laid our course up the Halifax, into which near its mouth, Spruce Creek flows. At this place it is wide and shallow, winding through extensive marshes and mangrove islands, and much encumbered by oyster banks, many of which stretch across the stream. These oysters are large and well flavored, and so abundant, that hundreds of vessels could be loaded with them. Sailed up the creek for two miles, meeting only one boat, which was shark fishing. Then we stopped to get bait, and Lewis, my guide, with a few casts of his net procured for me a dozen mullet, the usual bait for all fishes in this region. Sailed on four miles further, when the banks began to be higher and wooded, and the water grew fresh, when I put out a trolling line with mullet bait, and caught a red fish or channel bass of five pounds and two salt water trout of two pounds each, *Corvina ocellata* and *Otolitus Carolinensis*. Here on the east side of the creek we found a bluff of coquina rock, some fifty feet high, covered with forest trees, and with its sides washed by water into curious forms. The river at its base is very deep, and is said to contain large fish, especially snappers and groupers. About a mile above this bluff, having put out a second line with a spoon, I took with it my first black bass, it was of about two pounds weight, and made the leaps characteristic of the species. Next I got a red fish of about the same size. I observe these fish caught in fresh water are higher colored than those of salt water, the back being of a rich dark brown, and the sides of bright copper color. The salt water trout taken here, are also of deeper colors, with larger spots than those taken in the salt water. Three miles further, rain coming on, we stopped and camped about 4 P. M. at a bluff on the west side, where the King's road, one hundred years ago, ran from St. Augustine down the coast. After the shower we rowed up the river a mile, and got half a dozen more black bass and lost several by their habit of shaking out the hook as they leap. I got two dogfish, *Amia calva*, a western acquaintance, and not a valued one, as this fish, though interesting to naturalists from being the only representative of an old world family, is worthless as food, and makes himself so odious by cutting lines and breaking hooks, that the angler regrets that it should have survived its kindred.

We swung our hammocks between two trees by the fire, and after a supper of bass, with bread and coffee, should have slept sweetly but for a band of hungry mosquitoes which lighted by the moonbeams, found us out, and sung in our ears their detestable song. Next morning we started at sunrise, and trolled up the creek with hand line and rod and reel, both having spoons attached. On the hand line Buel's propellor, in white metal; and on the reel line two brass flyers revolving round a brass wire—the latter seemed to be the favorite, and took more and larger fish. Got back to camp at 8 A. M. with twenty-five black-bass and four redfish. The former were from one to three pounds weight and the latter of about the same size; we lost three bass by shaking loose the hook. As the weather looked threaten-

ing we broke camp and returned down the river, taking four more bass by the way. We got entangled among the oyster banks at low tide, and lost an hour, the rain falling heavily. When we got out of these shallows, we set our sail to the breeze, and went down the river flying, almost running over a large alligator which lay on the mud, as we rounded a point. As we emerged into the broad Halifax, we saw two objects on the further bank which looked at the distance of half a mile like bears, but being quite near a house, Lewis thought they must be black hogs feeding along the beach, though they looked too large for hogs of this region.

We learned afterwards that bears had repeatedly been seen on this very spot, and had carried off hogs from the man who lived there. So that if we had sailed down upon them, my guide had his rifle and hound in the boat, might probably have killed one or both.

Having caught these black-bass, *Grystes salmoides*, in three rivers in Florida, the St. John, the Tomoka, and Spruce Creek, I find them to be of about the average size of the same species in the western waters, viz. from two to three pounds; and although they may grow larger here than in the western lakes and rivers, yet I am inclined to think that those weighing from fifteen to twenty pounds said to have been taken here, were estimated rather than weighed.

S. C. CLARKE.

For Forest and Stream.

GAME AND SPORTING IN TEXAS.

STATIONED at Fort Mason, Texas, Mason county, I went one August afternoon with my Lieutenant, three men, and Indian guide, or scout, south about six miles to the Llano River, to stop over night and have a little sport by way of an evening and morning hunt for turkeys. We soon arrived on the green banks of this small, clear, rapid, and beautiful stream—here not more than forty feet wide—when the tent was pitched, the horses lariat out to graze, and our "man Friday" (the cook) directed to cast his line into the sparkling waters and bring out some fish for our supper. The rest of us remained loitering in camp, but getting our guns ready for the little sport we anticipated just after sundown, when the turkeys would come in from their rambles upon the prairies to water and roost upon the tall trees which lined the stream. As directed, our man Friday went down to the stream with his coarse and uncouth line, with a little raw fresh meat on the hook, and cast it in. Soon he had caught enough fish for our supper; that is, he had a nice string of about a dozen good sized pan-fish. Not wishing to cook them immediately he threw his string in the water to remain a short time, taking care to fasten the other end of the line to a stake stuck in the bank of the stream, whilst he went to camp, a few yards distant. Returning soon after for his fish, he was astonished to see his line jumping and bobbing about most frightfully. He did not know what to make of it, but thought the turtles were eating up all his fish, whereupon he seized hold of his line and commenced hauling it in, but in the meantime felt something pulling back and jerking most desperately. He renewed his efforts, and after a short but decisive struggle succeeded in bringing his antagonist to view, when lo and behold! he discovered that a tremendous yellow catfish was fastened to his line, whilst his cherished string of fish were nowhere to be seen, the big catfish having swallowed them all, "hook and line." He hailed for help—called for the Lieutenant to come down quick with his pistol and shoot the big catfish which had swallowed all his fish. The Lieutenant, with pistol in hand, ran down and engaged in the fight. They soon got their antagonist partly above water, when Lieutenant H. gave him a shot through the head with his revolver, but too far in front to kill him. Most unfortunately, the ball cut off the line in his mouth, and the combatants parted, never to meet again—the fish back into the deep water, still retaining his supper, and the other party to camp with an empty string as their show. Comment:—I have rarely seen two heroes more dejected and crestfallen than were the Lieutenant and Friday as they came into camp with the bare string only and related their singular and sad adventure. At supper, on salt pork, I tried to console them, but in vain, by repeating that trite but true old saying, "There's many a slip between the cup and lip." "So may the cat well think," dryly replied the Lieutenant.

On another occasion my guide caught in this same stream, with hook and line, a yellow catfish weighing sixty-two pounds. It was so large that he hauled it into camp by a rope. These yellow cat are found in almost every fresh water stream in Texas, and of all sizes. They are very fat, hard meat, almost equal to the trout in flavor, and splendid for chowder. But to have spoken of fish at all in this article was not my purpose. I have only thrown in an incident to my hunt. Now what about turkeys? In a few words I will tell you.

A little after sundown they were heard coming by gangs into the bottom for water and to roost. What a chirping and rumpus they raised by their calls and cross calls, here, there and everywhere. It was Babel worse confounded. Now was our exact time for sport, as they took to roost. The scout and myself seized our guns, sallied forth, and commenced the fray. I used the single rifle, and got ten shots before dark, bringing down my ten birds. The guide got about as many more. Neither moved 100 yards after we got among them, but loaded and fired as fast as we could. As there was no moonlight by which to shoot more, we gathered our game and went to camp.

The next morning before daylight we were under their roost, and at the first "peep o' day" we opened upon them again. What a confusion of notes and flapping of wings among the tree tops! What a fluttering and dangling in mid air, and what a wallowing of the ground and beating of the earth as they fall one after another at our feet. The very ground trembles at their fall, and the noise thereof is heard afar off. Rest assured there was excitement and sport there for awhile; but by sunrise the living had flown off to the prairies, and having killed enough we did not care to follow them up. A truce. We now collected our game, brought it to camp, took our breakfast from a roast turkey hot from the spit, packed the extra horse with our spoils, mounted our horses and rode into the Post by ten A. M., having turkeys enough to supply the whole command, say two or three hundred pounds of meat. This was the result of less than two hours' shooting by two persons, and was about an average hunt, in point of game, to others habitually made from this Post. A perfect stranger, recently writing from this place, informs me that the game is yet plenty there, and invites me to come down and have

a hunt with him. This is Texas hospitality—no more, no less. The people there are frank, generous, and kind to all who deserve their friendship, and strangers are always welcome among them. This I add for the information of your many readers, who may desire to go there to draw the trigger, cast the line, or recruit their health. In a few words, Texas is the only place I know of in the States where game may be literally piled up at leisure and pleasure by the real sportsman. The game is there, the open hunting grounds are there, and the climate is there. These all combine to perfection, especially during the months of October, November, and December, when camping out is perfection itself, and everything just right. During the months of January and February, and sometimes March, a few days may be found when it is rather too cold in camp for comfort, but this does not apply to the southern part of the State, and Gulf coast, where frosts seldom reach. Here one may bask in the almost continuous sunshine the whole year round and find good sport, either by land or water, in hunting or fishing. Yours truly,

OLD SCOUT.

NEW MATERIAL FOR FLY RODS.

EDITOR FOREST AND STREAM:

Being a fly fisherman of thirty years experience, and an amateur rod maker for ten or twelve years—that is, I have made those used by myself, and a half dozen given to friends—I think the following may be of interest and advantage to anglers and rod-makers: Some five or six years ago while walking in the vicinity of Catskill I cut a barberry staff, or alpine stock, as it is called in the polite age in which we live. It was left in my office or house for a year or so, when I chanced to take it in my hands. Being surprised at its lightness and stiffness, I planed off the bark, examined the fibre of the wood, which was close grained, springy, and of a beautiful straw color, and at once made a duplicate second joint for one of my fishing-rods. On trial it worked well and stood the test of several days' fishing. The following winter I cut a few more barberry sticks, from which, during the past winter, I made a butt and duplicate tips. The rod is three jointed—handle of rod of sumac, one inch in diameter for four inches, at lower end, for reel, one and one-fourth inches for the next six inches; then tapering suddenly in the next two inches to the diameter of half an inch. Into this handle, before shaving down, had been bored a half-inch hole to the depth of six inches, in this was inserted and glued the first joint of barberry three feet and a-half long; this tapers gradually to the first ferule, which is of the standard size, the taper of the second joint and tip is in the same proportion to the end of the tip. The rod is twelve feet long, pretty heavily mounted with German silver, and weighs just nine ounces. I have a rod of the same size of iron-wood, or horn beam, as it is sometimes called, with black walnut handle, that weighs eleven ounces. I have just returned from Sullivan County, where I used the rod for eight days, taking with it some hundreds of trout of small size, three to eight ounces. On one occasion while out, I hooked at one cast, two trout, weighing respectively thirteen and a-half and six and a-half ounces. Twenty ounce of very lively trout; in very swift water, I towed, or rather followed them about fifteen rods down the stream, when I drew them out upon the thickly wooded shore of the stream, by thrusting the tip end of the rod into a small opening in the woods, and trusting to the strength of the rod thus held to draw out the fish. It bent until it was not unlike a horse-shoe in shape; when the trout were safely landed, and the rod relieved of the strain which had been upon it for ten or fifteen minutes, it was as straight as when it made the first cast. With the foregoing experience and tests, I am satisfied that barberry is one of the best, if not the best wood used for rods. It is nearly as light as cedar, quite as stiff and quick in its action, not as liable to take a set as hickory or iron-wood, and is I think as strong as lance-wood. The butt and second joints should be, as in the case with my rod, made from sticks from half to three-fourths of an inch in diameter after the bark is removed. The sticks soon after been cut, should be secured by clamps to a joist or plank in such a manner as to straighten them, if crooked, as they usually are to some extent, and to keep them straight until they are thoroughly seasoned. In planing or turning, care should be taken that the pith be as near as possible in the centre of the joint—the grain of the wood is thus concentric, and greater strength and evenness of spring is acquired than if this caution is disregarded, or the joint made from a side or section of the wood. The tips must necessarily be made from a section of the stick—i. e. a quarter or half of it when split or sawed. I used but one of the two tips thus made for my rod on my late bout, and have thus far found it equal to spit bamboo or lance-wood as regards strength and liability to set, and equal to the former as regards lightness. The small pin knots which are numerous in the barberry, are quite ornamental if the rod is unstained, while they seem not to impair the strength of the rod.

A word in regard to the handle of the fishing-rod above described. I adopted it, or, I may say invented, for I never saw or heard of such a one until I made my first rod, for the reasons that I prefer the rod, when grasped, at least 1½ inches through—most of my rods are 1½. It is much less likely to cramp or stiffen the hand than if smaller, and by this plan could use light wood—butternut or cedar—for the handle, while hickory or iron-wood could be used for the first joint; thus securing a joint large in the hand, of great strength, and yet quite as light as those made of ash in the usual shape. I intend to test my rod with a five or six pounder in Canadian waters before the season closes. Possibly you and your readers may hear of it again if you wish to.

New York, June 15th, 1874.

—We are indebted to W. L. Puffer, Esq., of Brooklyn for a fine photograph of Santanta, obtained by him at Fort Sill, Indian Territory last summer.

FOREST AND STREAM.—We can commend to our readers who take an interest in out-door sports, this weekly paper, published in New York, as a journal which is excellent in tone, well posted upon the topics which it treats, and full of information upon subjects which pertain to the field and out-door recreation. It is not a sporting paper in the general acceptance of that term, but it is a vigorous advocate of those recreations which carry men to the forest and the stream, and which make men happier and stronger when enjoyed with the instinct of a true sportsman.—Boston Journal.

For Forest and Stream.
NYMPHÆ ODORATA.

TREMBLING slow with the water's beat,
Heart all gold and robes all snow,
Floats the flower, the lily sweet,
Safely moored to her home below.

Dreaming thou? of thy cousin fair—
Lotus—on breast of Nubian wave?
Blue as the heavens' deepest air,
Idle as Pharaoh's favored slave.

Dreaming thou? of thy tribe's great queen
Throned in southern lakes afar?
Holding her court in wondrous scene
Under fierce sun and tropic star.

Sigh not thou for the Nile's deep flow,
Mystic, wondrous, of bounty free;
Sigh not thou for the Amazon's glow
And the air like perfumes of Araby.

Rest content by thy northern shore,
Canopied dark by fir and pine,
Anchored safe to the weed-grown floor,
Sought with an homage pure as mine.

ists' Association.

FLASHES FROM THE "BLUELIGHT."

The U. S. Fishery Commission—Its Opera-
tions on Long Island Sound.

FIRST WEEK.

NOANK is a pretty, busy little New England village situated on rising ground, about midway between New London and Stonington, Connecticut, and about seven miles to the westward of that very fashionable, but excessively sandy summer resort, Watch Hill. Noank is not so fashionable, but if first impressions are to be relied upon, a much pleasanter locality. Its pretty white cottages—many surrounded by fruit and horse-chestnut trees—rising one above another from the irregular nature of the ground, make a charming rural picture from the seaward, which is not found exaggerated upon landing, and from the windows we catch beautiful views of the sound, and of the various islands which dot this portion of its surface; and the delightful cooling breeze from the sea, which at nearly every point of the compass is visible, ensures refreshing nights and no mosquitoes.

Ship building and fishing are the important interests of the town. Messrs. Robert Palmer & Co., add yearly a fair percentage to the tonnage of our fishing fleet. Vessels of from four to six hundred tons have been built by them for the fruit trade to Para and the West Indies. The smaller vessels are employed in fishing the adjacent waters of Block Island Sound and the southward, from whence they bring in full fares of mackerel, bluefish, tautogs, flounders, porgies and squeteague or weak fish—called locally "chequit" and "yellow fins," and in the spring time cod and haddock; these latter work to the northward and eastward as the season advances, and the schooners follow them over to the Georges Banks. The fish are packed here and sent over to Stonington, whence by each evening's boat they are carried to New York and you get them fresh and sound in your market.

Captain Chester, the first officer of the *Polaris*, is a native of this village, and has one of the pleasantest homes within its limits. A wonderful contrast it makes, with its pleasant grass plots and orchard, its shaded croquet ground and loney-suckle covered porch, to the pack ice and bergs and fierce wintry blasts of those far off regions where he has earned a reputation that has made him a part of history.

The little "Blue Light," filled with every necessary appliance for her summer's work, dredges, trawls, sounding gear, apparatus for taking temperatures and specimens at depths, &c., has found her way down from Portsmouth, and to-morrow we start on our first dredging trip.

The Commission is under the charge of Professor Baird, the United States Fish Commissioner, who is General Manager, and following in whose track—the twin harbingers of civilization—the telegraph and express train with New York mails, have been led to make Noank a stopping place. The former result is of much value to the people here, and they appreciate it, and already enough business is transacted over the wires by the residents to pay the expenses. To Professor A. E. Verrill, the distinguished Head of the Department of Natural History at Yale College, is assigned the task of superintending the details of study and research; to him are submitted all unknown specimens, and all knotty questions, and from him flows a never-failing stream of knowledge and instruction. No questioning wearies him, and if it does, he does not show it, and it is very hard to find the problem that he cannot solve.

The following named gentlemen have reported for the work:—

Professor S. F. Baird, United States Fish Commissioner.
Mr. Rockwell, Private Secretary.
Professor A. E. Verrill, Yale College.
Professor A. Hyatt, Boston Society Natural History.
Mr. S. F. Clark, Mr. F. M. Turnbull, Yale College.
Mr. Robert F. Brown, University of Wisconsin.
Mr. G. Brown Goode, Wesleyan University.
Mr. G. Saltonstall, Mr. Richard Rathbun, Boston Society Natural History.
Mr. J. H. Blake, Artist, Museum of Comp. Zoology.
Mr. C. W. Sherman, Smithsonian Institute.

Captain Hubbard Chester, Captain Wm. Ashby and Captain Spicer, of this place, have also become members of our party as pilots and for special service in procuring fish, attending nets, &c., &c.

The following are expected and will soon arrive, viz:—
Dr. H. C. Chapman, Dr. Joseph Serdy, of Philadelphia.
Mr. T. H. Bean, Smithsonian Institute.
Mr. F. W. Putnam, Peabody Academy of Science, Salem.

Mr. Sidney J. Smith, G. R. Kleeberger, C. Harger, J. C. Olmstead, Yale College, and probably several others.

Several of these gentlemen bring first-class microscopes of their own, so that, altogether, we shall, probably, have at least twelve engaged in microscopic examinations, and rich results may fairly be expected.

We were fortunate in securing at this place very suitable buildings for our work. A large sail loft adjacent to the water gives us a room sixty feet by thirty, well lighted with windows on every side. We have an ice-house for our fish and a wharf for our own use. At each window in the laboratory, as we have christened the sail loft, the Professors have their tables, and there night and day they can be found looking into things. One with apparently one eye glued to a microscope, through which he is looking at a seemingly empty, (but for salt water,) dish; the other guiding his skillful fingers, as with his pencil he rapidly sketches in enlarged size the speck which close scanning discovers in the dish. It is but a tiny reddish speck, surrounded with a film of white. A peep through the glass confirms the accuracy of the sketch and shows a little object like a tiny

Figure 1.*

branch of coral, with red predominating, but mingled with yellow and other shades, but it is not now living matter. It is a little creature struggling into life from the egg. Each little branchlet has sprung from the original hydroid, and from each, in various stages of development, appear little buds. These buds will grow and expand, and assume a saucer-like form, like the cup of an acorn, and another will grow beneath it, and many others, and as each

Figure 2.†

Figure 3.‡

little saucer attains maturity, the ligature between it, and the next one in the nest will tighten, and soon it will become detached and float away, an independent living jelly-fish of the species *Cyanea Arctica*, and from that egg countless more will spring into life, and the waters will teem with them; and from microscopic creatures they will become monsters, from three to five feet in diameter, with tentacles thirty or forty feet in length, and one encountered by Mr. Alexander Agassiz lay quiet and permitted him to measure its huge proportions of seven feet diameter, with tentacles one hundred feet in length. It was but last week that the fishermen of Noank came grumbling home from their pounds and nets off Block Island, for the jelly fish left clinging to them by the falling tide had broken them down with their weight.

The *Cyanea* is not, however, common of this great size. Thousands of from six to twelve inches across are quite plentiful, and, floating in the noonday sun, on calm days, furnish shelter to little fish, which are often found among their tentacles, and shaded by the disk—"butter-fish" they are called, from their being very slimy and greasy to the touch. It is presumed that this slime protects them from the injurious stinging, nettle-like effect of the jelly fishes' rays, which is sufficient to protect them from the attack of larger fish. We find little fish of other species dead under

*Fig. 1—Hydroid, or young state of the red jelly-fish (*Cyanea Arctica*). a, one of the hydroids partly developed; b b, two runners from which buds will develop; c, a bud of small size.

Fig. 2.—The full grown hydroid, or "strobila," beginning to divide.

Fig. 3.—One of the young jelly-fish just separated from the "strobila."

this disk, and smaller jelly fish, which have either taken refuge or been drawn in to be devoured. But, lazy and well fed as the *Cyanea* is, "still he is not happy;" a parasite on him, which somewhat resembles a lively shrimp, of an inch in length, burrows at will through his soft and yielding body, and if he has sensations must give him no end of trouble; but it don't last long. He is born and dies within the year, and his bloated body, 99 per cent. of which has been found to be water, resolves itself into its original elements.

I hope in another letter to give you the result of a good week's work, but the wind is to the south-east to-night, and I hear the fog-horns on the light-houses as I write, and I have my doubts for to-morrow. PISECO.

REPORT OF COMMISSIONERS OF FISHERIES OF THE STATE OF NEW HAMPSHIRE—JUNE SESSION, 1874.—As a river running through various States is subservient to the greater or less care taken of it, as far as fishculture goes, at its mouth, the commissioners of New Hampshire, Messrs. Hatch, Fletcher and Sanborn, congratulate themselves on the erection of the dam at Holyoke, as its presenee must materially affect the fish interest of their state. The commissioners suggest that the law requiring fish ways to be built on the Merrimack and Connecticut rivers and their tributaries, be deprived somewhat of its sweeping character, as there are a great many tributaries on which fishways will never be needed within the meaning of the statute. Of the salmon, last year 165,000 young fish were carried to the head waters of the Merrimack, coming from Bucksport, and 20,000 other fish, matured from eggs received from Prof. Baird, were also placed in the stream. In about 1875 it is hoped that the salmon will make their grand voyage to the sea, and that after that a sufficient number will return, though some difficulty it seems exists about Lawrence. The commissioners state that at Meredith they have over 250,000 young salmon intended for the head waters of the Connecticut. Of land-locked salmon, the commissioners were unable to procure the quantity they desired. A certain number placed some time ago in Newfound Lake, will be searched for this year. Of white fish, the attempt to secure eggs having failed, an effort will be made to procure them this fall. Of shad, a large number of eggs will be carried to Lake Winnipissiogee this season. Black bass (*Gristes nigricans*) have done remarkable well in the State, showing a wonderful capacity for propagating their species. The commissioners stocked quite a large number of ponds last fall, and propose placing this useful fish in various small lakes this fall. Salmon trout were hatched out at Meredith last fall, and were placed this spring in Ossipee Lake.

—The *Boston Traveller* has an interesting account of lobster canning at Mount Desert. Twenty-five thousand cans are put up weekly, employing fifty people. Cans contain one pound. Only the claws and tails are used. The concluding paragraph contains what is most interesting to us. "The parties who set the nets cull out the large lobsters for Boston and other markets." Now of course all the small ones go into the cans. The consequence of this is told in another sentence. "Lobsters are not now very plenty, and are rather small." Now it is fair to suppose from the small size of the catch, three lobsters, as the claws and tails are only used, must go to fill up a pound can. That means 75,000 or 100,000 pounds of small lobsters used up every week. This is simply another phase of killing the "goose which lays the golden egg." Though the coast of Maine is long, its bays and estuaries numberless, the time will come when there will be no lobsters, big or little to can. It is unfortunate that the law of the State of Maine in regard to the catch of lobsters, limiting them as to size, was not made uniform with that of Massachusetts. France and England take all our canned lobsters, and the former country contracts for supplies years ahead.

—A large aquarium is in process of construction at Manchester, England. The tank will have a frontage of 750 feet.

—We have a deferred article on the Protection of Trout in Maryland, with a few notes from the Blackwater, Virginia.

—We have in type a deferred article from C. G. Atkins, Esq., State Fish Commissioner of Maine.

Natural History.

—In *La Nature*, M. Gaston Tissandier gives an interesting account of two orang-outangs now in Paris at the *Jardin d'acclimation*. M. Tissandier says "they are quite young, have a slow and indolent movement, but are most good natured. My brother the other day placed the male monkey on his knee, to draw him, and it was curious to see his sister scrutinize the paper and pencil. The two are very familiar, and offer their hands to any one who looks at them. Their keeper told us that though very young, they ate their soup with a spoon, and drank in a glass, much more nicely than would well grown children. The keeper who is a sailor never leaves them." A naturalist, M. Vayssiere, of Marseilles, who took careful measurements of these young orang-outangs says "these young creatures, never would amuse themselves with other monkeys animals on board ship. It was curious to see how these orang-outangs would play all day with the men and children, and were indifferent to all other creatures endowed with less intelligence than human beings. M. Tissandier adds that at present the orang-outangs are in excellent health, and delight in the trapeze and all kinds of amuse-

ments. He doubts, however, whether they can be brought to maturity, and is afraid that the winter will kill them. M. Tissandier in speaking of their many wonderful traits, which resemble the chimpanzee, cites Buffon's chimpanzee, which always offered his arm to visitors, and Jeffries' orang-outang which always washed out his own cage with a towel; and Brehm tells of another orang-outang on board ship which lit the fire, and watched the bread when baking." What a funny theory that was, we noticed sometime ago, which emanated in France, to wit: That it was the enlarged or amplified effects of speech, and its development into a language, which alone divided a man from a monkey, and that at one time the best speaking monkeys by the theory of selection, left out in the cold less talkative portions of their race, and so after a while man was brought from out of the animal neck. So much for gab!

—Mr. W. B. Tegetmeir of the *Field*, states that young pheasants are dying in England. He accounts for it from the fact of improper feeding, as it has been the fashion lately to give the young birds food highly spiced. This excellent authority says: "the employment of these condiments for young pheasants or fowls I cannot but regard as about as sensible as feeding an infant upon highly-spiced curries."

—One of our friends has just shown us a pretty white bird, caught last week at Setauket, Long Island. It was of a whitish plumage, with a tinge of lemon on the primaries. We pronounce it to be a gray kingbird, *Tyrannus domicensis*, common in the West Indies and Florida, sometimes seen in the Carolinas, and exceedingly rare to find in this section of country, though noticed sometimes as far north as Massachusetts. (See Coues' North American Birds.)

THE RARA AVIS.

EDITOR FOREST AND STREAM:—

Will you, or some of the readers of FOREST AND STREAM, inform me what bird makes its nest and lays its eggs under water. In hunting for the eggs of the water hen or coot, I have often found a bunch of lake moss about an inch out of water. On opening this would be found from five to seven eggs of a dirty white color, about the size of a quail's.

Yours truly,
Nicasio, Cal., July 6th, 1874. PIONEER.

CENTRAL PARK MENAGERIE.

DEPARTMENT OF PUBLIC PARKS,
NEW YORK, July 19, 1874.

Animals received at Central Park Menagerie for the week ending July 18, 1874.

Seven Porto Rico Pigeons, *Columba corensis*. Hab. West Indies. Presented by Mr. Henry Beste.

One Woodchuck, *Arctomys monax*. Presented by Mr. W. W. Arnold.

One Peacock, *Pavo cristata*. Presented by Mr. D. Messmore.

One Raven, *Corvus carolinensis*.

One Yak, *Bos grunniens*. Hab. Tibet. Bred in the Menagerie.

—In some countries frogs are used as barometers—the species employed for this purpose is the green tree frog. They are placed in tall glass bottles with little wooden ladders, to the top of which they always climb in fine weather, and descend at the approach of bad weather. This is a cheap and highly interesting weather glass where the green tree frog is to be procured in its natural state.—*Science Gossip*.

Woodland, Lawn and Garden.

ANSWERS TO CORRESPONDENTS.

F. WILLIS, Bergen, N. J.—"What will kill the cabbage worm?" This pest of our gardens, a species of *Pieris rapae*, has long been well known, and very troublesome to our gardeners in many portions of different States. This season it has been quite abundant. The butterfly lays its eggs about June, and sometimes earlier. We have used successfully damaged salt, dirty, and which was obtained for a few cents per bushel from storehouses destroyed by fire. Applied in small quantities around the plant, upon the top of the ground and hoed in, it acts as a dead shot to the cabbage worm, and is a good fertilizer also. I have used with unfailing success, without a single failure, "Gould's Fertilizer," applied as above. The fertilizer is sure, safe, and never fails. O. Q.

EMMA G. ROWE, New York.—"I grow good plants, but I find frequently my pots filled with large worms which clog my plants and almost kill them. Please tell me how I can rid myself of them?" By *boiling* the earth before potting your plants, will be found a certain remedy for earth worms and insect life contained in ova. Watering with a decoction, one gill to three pints of water, of "Gould's Fertilizer," will surely kill and expel all worms, and carbolic water will also prove the bane to hundreds of insects beside worms, if carefully applied. Use fifteen to twenty drops of carbolic to one quart of water, and pour over your earth in the pots. Where worms are known to be present we always take our plants out, especially the rose plants, and wash the roots in a weak solution of one pint of good soap suds water, and replace again. O. Q.

MARY MAY, North Andover, Mass.—The plant, of which you send a "leaf and flower," is the *Lapsana Communis*, or "nipplewort," quite common in some parts of this State. It is sometimes called "Swine's Cress"—is a branched plant of some two to three feet high, with regular rays of yellow leaves. It may be transplanted. We have a fine cluster of it now growing in our garden filled with its golden blossoms. Blooms from July to October. You can transplant it safely at almost any time. O. Q.

CHARLES CLINTON, Buffalo, N. Y.—On old and neglected plants you most commonly find the scale insect. Some plants, as the oleander, the caper tree, and sometimes currants are troubled with them. There are several insects that prey upon flowers and plants, as well as small fruits, that closely resemble the scale insect; but if you have any

doubt as to the real scale, you can at once solve it by placing a small portion of the leaf under a microscope. You will find him a little round fellow, totally unlike all others, and always on the under side of the leaf. As a remedy, have used a decoction of quinine chips—also, a brush dipped in whale oil soap. In plant houses, thoroughly ventilated, they seldom appear. I have used a wash made from half pound of pulverized hen manure, quarter pound of flour of sulphur, mixed in warm water—the above to two pails of water, carefully applied with a rose jet syringe at night. This with me has proved a quietus, only two applications being necessary. O. Q.

MARSHES MADE PRODUCTIVE.—The experiment made at Marshfield and Scituate by which a large amount of marsh land has been brought under cultivation by the erection of dykes promises to realize the brightest anticipations of those who were active in reclaiming the salt marsh and transforming it into soil adapted to the cultivation of vegetables, etc., etc. A crop of herdsgrass is now growing, samples of which were exhibited to several prominent agriculturists, which will yield three and a half to four tons per acre. In a few years it is anticipated that a large quantity of vegetables will be raised for the use of the Boston market.—*Boston Journal*.

—It is an admitted fact in Japan and China that the older the tree the better the tea. The shrubs which supply the nobles of Japan with their favorite beverage are said to be in many instances 500 years old.—*Land and Water*.

The Kennel.

THE RAYMOND-LAVERACKS.

FAIRY and Pride of the Border, two magnificent specimens of the setter, imported by us from Mr. Laverack for C. H. Raymond, Esq., of Morristown, N. J., arrived on Tuesday, the 14th, in the Inman steamer City of Brooklyn, in as fine condition as could possibly be desired. As before mentioned, Fairy is a lemon and white Belton, two years old, own sister to Fred. IV. A lithograph of this dog appears in Mr. Laverack's book on "The Setter."

Mr. Laverack, in a recent letter to us, says, "I shot over her all last season in Scotland, and consider her as good as any I ever had at all species of game, as purely bred and remarkably handsome. I sold her sister, Nellie, to Llewellyn for 100 guineas. Pride of the Border is liver and white. I have shot over him four seasons; he is now five years old, very good on all kinds of game found here, steady as can be, either single or double. He is very well bred, being out of my favorite blue bitch, old Belle, by Fred. II; he strains back thirty years to the old Edmond Castle breed, as good as mine. I kept him in order to breed back with my own, and now am using a blue dog, a son of his, out of blue Nellie. He will get blues, lemon whites and some liver and whites.

The price paid for Fairy was over \$600, and landed here she has cost \$650. The two of them stand Mr. Raymond in not far short of \$1,000. Large as the sum may seem to some of our readers, we still consider them well worth the amount. And to show how highly Fairy is appreciated in England, Mr. Laverack refused, just previous to her being shipped, £200 for her, also several offers from other parties in this country. She is in whelp to Blue Prince, a son of Pride of the Border. Blue Prince took the second prize at the recent Crystal Palace Show in the English open class. They are the only pure Laverack's, with the exception of Dr. Gautier's Ruby, in this country.

Bell's Life, in speaking of these dogs, says:

"The setters formed one of the grand features of the show, a collection of 119, comprising nearly all the crack dogs in the country, never being exhibited before at one time. In the English class there were five champions, and notwithstanding that Mr. Laverack's old Dash is 13½ years old, there could be no question about the judging being right, for if the old dog has gone a bit in his quarters, this is just the weak place amongst his younger competitors. Mr. Jones' Rap, the last year's winner at the Crystal Palace and Birmingham, being a beautiful and forchanded dog, but he is not so good behind, and he wants the curve of the thigh so remarkable in Dash. It is a fine finish up for Mr. Laverack's grand old dog, who was looking as fresh as paint, for undoubtedly Dash has done more for the "setter stud" than any dog that has ever breathed. As the sire of Bruce, Countess, Nellie, Sam, Garth's Daisy, Victor Pilkington's Dash and a lot of others, counted to be the best dogs of their day. Further honors awaited the old veteran, as a son of his, Mr. Hemming's Rock, a sweet dog to look over landed the English open class, with Blue Prince from Mr. Laverack's kennel, a very clever shaped one, second grandson of old Dash, being by Pride of the Border out of Nellie."

We have urged upon Raymond how absolutely necessary it is by no means to allow either the dog or bitch to be mated with anything except of the purest lineage and breed, and would advise him not to cross either of his animals with any other, unless they can show positively some Laverack blood, and so carry out the additional name of the breed, the Raymond-Laveracks.

These splendid specimens of the highly bred, inter-bred, inter-crossed, bred back, educated setters will be on exhibition at the office of this journal, as soon as they have recovered from their long sea voyage, due notice of which will be given in these columns.

The following letter is the only commission we have received, or require from any of our friends, for placing them in communication with breeders of dogs, or manufacturers of guns.

FOX FARM, MORRIS PLAINS, N. J.,
July 18, 1874.

EDITOR FOREST AND STREAM:—

It gives me much pleasure to inform you that Fairy and

Pride of the Border reached New York last evening on the City of Brooklyn.

Mr. Laverack himself very kindly brought them to Liverpool, packed in fine roomy lampers. They received the best of care during the voyage, and arrived in splendid condition.

Permit me now to assure you of my sincere thanks for your kindness and courtesy in arranging the correspondence with Mr. Laverack, which has obtained for me these valuable setters. But for your promptness and attention I should have failed to secure them.

It will not be prudent for several weeks to bring Fairy to your office as we have arranged; but I shall be gratified to have you run over here the latter part of next week, by which time, in addition to Fairy and Pride, I hope to submit to your critical inspection the first litter of pure Laverack setter puppies born in America.

With renewed assurances of my appreciation of your friendly services, I am very truly yours,

CHARLES H. RAYMOND.

A FIELD TRIAL MATCH.—Public performance in the forests and on the streams is the only true criterion of the sportsman and angler. Our correspondent, "Mohawk," has matched his red Irish setter, Dan, against "Gopher's" orange and white bitch Belle. The match is for \$100 a side on snipe, to take place at Pine Brook, N. J., and to be run under the FOREST AND STREAM's field trial rules, as published by us on April 9th, 1874. Both parties has naturally great confidence in their animals, but as Dan has a very high reputation, being considered by many field sportsmen second to no dog on snipe, with the exception of his sire, old Dash, the odds are slightly in his favor. Gopher's Belle is well bred on both sides, and we understand is working well on woodcock. The match will create much interest among field sportsmen, as both gentlemen are known as graphic delineators of the dog, gun and poultry, in several of our prominent journals. We trust that the day is not far distant when that which we have so urgently advocated, field trials, will be as thoroughly established here as in England. Then gentlemen will have an opportunity of testing the superiority of their dogs for a small entrance fee, without the necessity of resorting to private trials in order to determine the always much vexed question—whose is the best? The amount of benefit to field sportsmen and their breed of dogs is beyond estimate. To insure success some other place than Pine Brook will have to be selected, as it may do well for a private match like the above, but not for a large entry field trial. We are glad that this match has been made, and hope it will lead to the establishment of other field trials, so that there will not be so many magnificent animals who have performed such extraordinary wonders in private. In our next issue we shall treat the subject more fully, and publish for the first time in America, the Quail field trial stakes for setters and pointers, the Puppy stakes on Snipe, and the All-aged stakes for Setters, also submit a proposition for the immediate consummation of this much to be desired object.

PERSONAL.—We have lately received letters from "Old Calabar," and Mr. Teasdale-Buckell, of England, containing personal criticisms of members of the Kennel Club of England and other gentlemen dog breeders. We have repeatedly stated in these columns that we cannot afford space, nor do we wish our journal to become a paper to discuss personal grievances. At the same time we shall be glad to afford space to any gentleman in England or at home willing to favor us with practical information about the breeding of field dogs, whether they are "Idstone's," Laverack's, Macdonald's, "Old Calabar's," Price's, Llewellyn's, or any other breed.

DOD MUZZLE.—We are pleased to recommend to our numerous friends, owners of dogs, the new patent automatic dog muzzle, invented by W. T. & J. Mersereau, of 62 Duane street. The muzzle is made of galvanised wire, light and easy of removal. By an ingenious spring attachment the animal can open his mouth, drink, pant, &c., without causing him the slightest worry or inconvenience. We agree with Mr. Berg when he says "it is the most humane invention of the age."

—The appointment of regular officials to catch the vagrant dogs in New York, is a step in the proper direction. The fifty cents heretofore paid to vagabonds for stealing dogs, will be the emolument of the duly authorized dog catchers. Two hundred dogs were killed last week. In Brooklyn dogs are shot on sight by policemen, if they are found straying. This is a dangerous practice, and it is a wonder some human being has not been killed yet. The mad-dog scare, like other mental epidemics, is gradually passing away.

—Believing that, no matter how calmly we might discuss the question of Rabies and Hydrophobia, it would only add oil to the flames, we have for some time abstained from discussing these subjects. We still repeat, incise deeply, when bitten use fuming nitric acid, or if not obtainable, lunar caustic, and favor the discharge by poulticing. We notice the use of ligatures, as proposed by us, as coming into vogue.

—Philadelphia kills her useless dogs by the use of carbonic acid and carbonic oxide. The former mothers, but the latter gas kills outright. The gasses are simply made by burning charcoal and turning the fumes into a close chamber. In less than ten minutes all the dogs are dead.

GORDON SETTERS AND RETRIEVERS.

FAVERSHAM, June 23d, 1874.

EDITOR FOREST AND STREAM:—

I can get broken Gordons at £25 to £40 the brace, and ordinary setters, well broken, at about £30 the brace; spaniels at about £15 the brace; beagles at £12; retrievers would be about £20 apiece wavy or curly.

I have now two retrievers—bitches—one wavy and one curly, tolerably broken, at £20 apiece. I will start any dogs you want by the steamer, but of course the buyers must stand carriage and all risks after the dogs leave my hands.

I am, however, not much "taken up" with dog dealing, as the men who buy dogs are always disappointed, and always abuse the vendor frightfully.

I cannot send dogs without first receiving the money, nor can I return the money and take back the dogs. What I will do is this: If a friend of yours wants a £20 setter, for instance, let him send me £20 through you and I will use my best discretion in procuring a setter worth £20 by trying him beforehand, &c. I shall not require any commission.

I merely throw out these suggestions in case you may require any dogs. I really don't care about the business; you get so much abuse and annoyance. My father is sick of it and talks about selling out, though he has been very successful.

IDSTONE, JR.

NEWTON, SUSSEX CO., N. J., July 9th, 1874.

On the day of the unveiling of the Waddell and Anderson kennel at this place, I had the pleasure of meeting and dining with not only yourself, but with Col. Skinner and Mr. Busby, field and agricultural editor of the *Turf, Field and Farm*, Mohawk, Gopher, Shipman, Northrop, Morgord, and others, all gentlemen after my own heart in the way of sportsmanship and fellowship. Since you were here Mr. Morgord sold his famous setter Joe at a high figure—\$500. This would appear to many persons a very high price to pay for any dog, and it is certainly a very liberal one, but I have done considerable shooting over this dog, both in Iowa, Wisconsin, and in this State, and can aver that he is not only a splendid specimen of a high bred setter, but is superbly broken, has a stylish way of going, has an excellent nose, very staunch on game, and is perfectly broken to retrieve on land or water. Although I have never had the pleasure of shooting with Mr. S., the purchaser, yet from conversation with him I am convinced that he is a skilful shootist, and will appreciate such a dog. I would say, however, that Joe is a slashing high strung dog, and it requires a prompt, energetic master to control him.

Since Mr. M. parted with Joe he has taken in hand and is now shooting over Frank, a full brother to Joe, also a splendid looking and very superior setter, which will, I think, in such skilful hands, soon be as valuable a dog as Joe. When you gentlemen were at this place you saw a very stylish, white young setter named Bob, owned by Mr. James Northup; this dog was got by Joe, and is out of Fly, Jr., bred from my old imported white setter bitch Fly. Since the woodcock season opened Harris and I have had some shooting over this dog, and now, although I have been shooting full forty-five years over the very best dogs I could procure in this country or in Europe, I can truthfully say I never saw a better, if as good, a dog of his age. He is only sixteen months old. I am now shooting over my setter Czar—the Blue Belton described in *FOREST AND STREAM* some weeks ago—and a better broken, more staunch, better retriever, or more pleasant dog to shoot over has rarely ever fallen to the lot of

Yours truly, HORACE SMITH.

Shot Gun and Rifle.

GAME IN SEASON FOR JULY.

Woodcock, *philohela minor*. Squirrels.

Details of pigeon shooting and scores of rifle matches, and other interesting matter, should be mailed so as to reach this office on Tuesday morning in each week.

—Woodcock in the market, fairly plenty. Of course New York draws all the birds of the United States into the market. From a pretty close calculation, we suppose about 1,800 single birds come into New York weekly. Long Island birds scarce. Bulk of cocks coming from Kewana, Illinois. Some few from Michigan. Price \$1.50 a pair. Birds generally small, though in good condition.

—The bay snipe are beginning to arrive off Cape May, but not in quantities.

—A letter from St. Paul, Minnesota, speaks of excellent woodcock shooting on the Minnesota River bottom about twelve miles from that city, and bags of thirty to sixty per gun each day are mentioned casually as if nothing remarkable. The birds are still small, yet have been shot at for three weeks past. Pity 'tis, 'tis true.

PINNATED GROUSE IN IOWA.

CEDAR RAPIDS, IOWA, June 15th, 1874.

EDITOR FOREST AND STREAM:—

In answer to a correspondent as to where he could find chicken shooting, with elk or deer, you directed him to Norway, 18 miles from this city. Let me say that you are partly in error. Chickens are scarce in that vicinity. A person might go out after the 14th of August, and find once in a while a covey of chicks; he might, with a good dog, bag from seven to twelve chickens, and have to work mighty hard. Now, if one wants a good chicken country West, let him either take the Illinois Central from Chicago to Cedar Falls, then the Burlington, Cedar Rapids, and Minnesota Railroad to Greene, or the Milwaukee and St. Paul to Plymouth (both roads run into each other), and from Greene (look at the map), above Austin, Minnesota—don't talk of shooting, but slaying—a couple of good shots with dogs can bring in from 50 to 150 brace of chickens. I will guarantee any sportsman, or party, good sport, quail and pheasants all he wants, and up to the 15th of December the Canada geese, brandt, sand hill cranes, ducks, except canvas backs, and a few wild turkeys. You can refer them to me any time. For elk and deer you have to go farther North into Minnesota. Yours, &c.,

FRED. DAY.

—The tournament of the Cincinnati Shooting and Fishing Club commenced at the Carthage Fair Grounds on Tuesday,

21st instant, to continue four days. Prizes to the amount of \$1,000 offered. On the fourth day are single and double bird sweepstakes.

—The pigeon shoot of the Skaneateles Sportsmen's Club on the 11th instant was very interesting, although wind and rain operated unfavorably. First match, 10 birds, for the champion pitcher: J. H. Earll, 7; G. Rawlins, 8. Second match, sweepstakes at 10 birds, 21 yards, three prizes, with the following score: E. D. Wheadon, 9; H. Thurlow, 6; George Rawlins, 2; R. B. Harmon, 8; J. P. Wheadon, 10; J. Horatio Earll, 8; W. H. Crosier, 7. J. P. Wheadon won. The tie of 9 was shot off at 26 yards, 5 birds each: E. D. Wheadon, 5; George Rawlins, 2. The tie of 8, 5 birds each, 26 yards rise; R. B. Harmon, 5; J. Horatio Earll, 2. Third match, at 5 birds, 21 yards, 80 yards boundary, nine contestants; won by Mr. Shepard with 5 birds; five ties of 4 birds each. Fourth match at 5 double rises, 18 yards rise, 100 yards boundary. The sun at this time was shining directly in the contestant's faces, making it almost impossible for them to see their birds as they rose from the trap: E. D. Wheadon, 5; George Rawlins, 9; W. H. Crosier, 5. There being but 10 birds left, Messrs. Guppy and Shepard bought them and shot them off on double rises with the following result: W. H. Guppy, 5; M. Shepard, 2.

—Capt. Bogardus and Mr. Joll shot a match at pigeons for \$250 a side at Beacon Park, Boston, Mass., which resulted in a victory for the former, Joll giving up at the seventy-fifth bird. Joll had ten dead birds to start. Score: Joll 56, and Bogardus 69 out of 100.

—A match for the Champion Pitcher of the Skaneateles Sporting Club took place on Wednesday July 8th, between Wm. H. Crosier, challenger, and G. Rawlins, holder, with the following result:—

Ten birds each, 21 yards rise, 80 yards boundary. New York State rules.

W. Crosier.....—7 | Rawlins.....—7.

One shot off the tie at 26 yards, Rawlins retained the pitcher with the following score:—

Crosier.....1 1 0 0 1—3 | Rawlins.....1 1 1 1 1—5

TORONTO, July 13th 1874.

EDITOR FOREST AND STREAM:—

It is quite a long time since we have had a shoot for our monthly prize of a case of stuffed birds. The delay was owing to the scarcity of birds suitable to shoot. We succeeded in getting enough good pigeons together for a shoot last week, so it came off on Thursday, the 9th instant, on the Garrison Commons in the west end of the city. The following were the scores made:—

Name.	Yards.	Straight.	Total.
Dr. J. Ross.....	21	7	9
J. Taylor.....	21	6	9

*Killed, but fell dead out of bounds; scored against him.

The ties to be shot off at the next meeting, the contestants to fall back 3 yards on the respective distances. When it comes off I will send you the report. Yours very truly,

TORONTO GUN CLUB.

LAWRENCE, Kan., July 15th, 1874.

EDITOR FOREST AND STREAM:—

I send you herewith report of match shot here on the 4th of July, under the auspices of the Winkle Club of this place. The prize was an oil painting, painted for the occasion by Mr. L. C. Earle, an artist well known in the West, and who has just returned from a two years' course of study in Munich. He had the reputation, some three years ago, of being about the best artist in the West in his particular line (game subjects), and has lost nothing by his European trip. The match was participated in by a number of crack shots from different parts of the State, and was eventually won by Mr. Stuart, a member of the Winkle Club. In several cases the same party shot one string for himself and another for some one else; but in none of such cases was the shooter made aware of which string he was shooting on his own account until after the termination of the match. To save birds and expedite matters generally, several parties dropped out after missing two or three birds, considering their chances of winning virtually extinguished. The birds were tame pigeons, for the most part strong, old birds, and helped as they were by a prairie zephyr (another name for half a gale of wind) required no end of killing. The following is the score:—

Match for an oil painting, valued at \$100, 12 single birds, 21 yards rise, 80 yards boundary, 14 oz. shot. Ties to be shot off at 3 birds at 26 yards rise. H and T spring traps. Winkle Club rules. 20 subscribers at \$5 each. Referee, Charles Chadwick, c. f. after gunmaker's name denotes the central fire breech loader, and m muzzle loader.

ORTIX.

PATTERN AND PENETRATION.

EDITOR FOREST AND STREAM:—

For the information of those sportsmen who may be interested in the results of the Chicago Gun Trial, allow me to state that the penetration pads were almost exactly the same weight as the English pads of the same size, there being only about $\frac{1}{4}$ of an ounce difference. The inferior penetration was probably caused by the yielding support behind the penetration pad, and it is to be regretted that the pad was not placed against a solid wall, or iron plate, that the penetration might have been correctly determined, for while pattern can be had without much trouble by the present system of boring, penetration is difficult to obtain, and taxes the ability of the gunmaker to the utmost.

Mr. Greener very truly says in his "Modern Breech Loaders:" "We can get better pattern, but we consider this of less consequence than the penetration. A gun that will put 120 pellets in a 30-inch target at 40 yards, and penetrate 35 sheets, is to be preferred to one that will put 170 and only penetrate 25 sheets."

Your Jackson, Miss., correspondent is in error about there being but one muzzle loader tested, as he will discover by referring to entry No. 5, which was a Geo. T. Abbey muzzle loader, 10 gauge.

PIONEER.

HANNIBAL, Mo., July, 1874.

EDITOR FOREST AND STREAM:—

An article recently published from a correspondent, and afterwards substantially endorsed by an editorial in regard to metal shells, is so much at variance with the experience of the writer in regard to them that, conceiving the matter to be of much interest to those sportsmen who may be shooting far away from their base of supplies, where paper shells are difficult to obtain, and to those who, in shooting in wet weather, find it troublesome to keep paper shells dry, but more particularly to those sportsmen—and they are many—who desire to study economy in the use of ammunition, I crave the privilege of stating for the benefit of the above mentioned, some few facts in regard to metal shells that may possibly be of benefit.

Your correspondent states that there are about two sizes difference between the metal and paper shell of the same number, and the statement is endorsed by you. I will preface my statement by saying that the shells I refer to are those made by the U. M. C. Co., of Bridgeport, Conn. As they are more largely used than those of any other makers' the size to which I shall refer is the No. 12; but the others bear about the same relation to each other. The calibre of Ely's 12 shell, as well as the paper shell made by the U. M. C. Co., one 11 gauge, the 12 a metal shell, are less than $\frac{1}{4}$ size larger by standard gauge, all the difference being in the thickness of the walls or sides of the shell. The question is asked, Why are they not made of the same calibre of the paper? The reply is, it is simply a matter of weight. Mr. Fowle, of Newark, N. J., and some other parties bore them out of a blank piece of metal, making them the same gauge of the paper shell, but it increases the weight so much that they are not suitable to be carried in the field; besides it adds more than three times to the cost. When the U. M. C. Co. commenced to manufacture the metal shell they found that the chambers of different guns varied very much in size, and there were continued complaints from one that the shells could not be inserted; from another that they burst in the chamber, &c., &c. An investigation showed, as before stated, that there was no regularity in chambering guns; in fact in the same gun there would be so much difference that while the shell would work all right in one barrel they would burst in the other. The reason why so little attention was shown in the matter, especially in low-priced guns, was because the paper shell would bear some compression, if the chamber was small, and it made no difference if the shell burst in the larger one. In order to overcome this irregularity, the U. M. C. Co. built a quantity of gauges of the correct size, and forwarded them to the prominent English manufacturers who work for the American market, and urged on them the importance of adopting a uniform size. Among those receiving the gauges were Messrs. Scott, Tolley, Green and others, and their guns are now built with reference to the use of either paper or metal shells.

It is stated by your correspondent that a gun built to use paper shells is not suitable for metal. The causes may be as above stated in reference to his gun, or the fault may be in tapering the chamber, which can be corrected by any good gunmaker who has the proper tools.

That guns are, can be, and have been built for a long time, to use either the metal or paper shell with good results, is an established fact which cannot be controverted. Also, that a gun built without any reference to the use of metal can be regulated to use them, providing the chamber is the proper size for the paper shell. Scott, Green and Tolley, and many others, have fully established this fact. For proof, see the tables of the recent published Chicago Gun Trial. There were eight guns tested with both paper and metal shells, and the result proves beyond a doubt that it is and can be done. The metal shells made by the U. M. C. Co. are made to exact sizes, with more care than are paper shells; in fact before they are turned out they are gauged to the one-thousandth of an inch. When first made they were made straight on the outside; now they are tapered, the 12 gauge fourteen-thousandths of an inch, and the 10's fifteen one-thousandths. The reason for so doing was because the barrel contracted and expanded more than the shell, causing them to stick, besides it allows more latitude in the size of the chamber.

The fact has been fully established that it is the gunmaker, and not the shell manufacturer who should be looked to. If any person who is interested in the matter will do as the writer has done—make a tour of inspection through the works of the Union Metallic Cartridge Company—they will find the gentlemanly Superintendent, Col. A. C. Hobbs, of lock-picking fame, ever ready and willing to exhibit and explain every detail, and show the visitor every courtesy. He will find that every care is used in the manufacture of the metal shells to make them supply all the wants of the sportsman.

The principal reason why metal shells do not work satisfactorily is on account of the too abrupt shoulder from the chamber to the gauge of the barrel, many foreign guns having a taper of little more than $\frac{1}{4}$ of an inch; if they are increased to from $\frac{1}{4}$ to $\frac{1}{2}$ of an inch it will almost surely improve the shooting with the paper shell, besides producing satisfactory results with the metal shell. Statements are made that there is danger in carrying metal shells about the person. I have yet to hear of an accident by so doing. Some few weeks since the editor of a prominent sporting paper mentioned an accident that recently occurred with a metal shell, and made some statements in regard to the danger of using them. The article came under the notice of the U. M. C. Co., who addressed a note to the editor and sent him a Starveant shell for examination, and giving their reasons why they thought them safe. After careful examination the editor frankly stated that the objection which he had previously entertained was wrong, and that he considered the shell safe to carry about the person, stating that it required a hard punching blow to explode the primer. Of the various kinds used by the writer, comprising those using the Orcutt, Berdan and Starveant primers, I consider the Starveant particularly safe: as the cap is small in size it is not home on the anvil until the bottom of the cap is below the face of the shell, and cannot be exploded without being struck a hard blow by some small, sharp instrument. In fact in re-capping the Starveant shell, if from any cause the cap sticks, it can be struck a smart blow with a hammer with no danger of exploding. The writer has often used a hammer to re-cap shell, using the No. 1 Berdan primer, the re-capper not being to hand, and never yet had an explosion, as they will not explode until the primer has reached the point of the anvil, and that is not done until the bottom of the cap is below the face of the shell. It is, however, a good rule, and one that always ought to be observed, viz: to always re-cap the shell while unloaded. Complaint has sometimes been made that the primers are not easily ejected when allowed to remain on the shell for some time after firing. They ought to be removed when the sportsman comes in from the field, it is true, but the necessity for so doing can be obviated by putting an oiled rag in the box with the primers.

The writer has no interest in the manufacture or sale of metal shells, but gives the above as his conclusions, arrived at after a careful examination and long use of metallic shells, and he also believes they coincide with the experiences of many others who have for years used metal shells.

Believing that the matter is of considerable importance to the sportsman, I would be pleased to see it discussed by those who may have had experience in the use of metallic shells. As before stated it is the matter of weight which causes the manufacturers to make a slight difference in the calibre, knowing as they do full well that the gunmakers can adapt their guns to the use of both the paper and metal; besides, in the case of the U. M. C. Co., they manufacture both paper and metal, the paper,

in the opinion of the writer, being better than Eley's of the same grade, besides being cheaper and more uniform in size. My experience, tests and measurements are the result of patient investigation, and if they may call out the views of others and result in a better understanding of the question by the shooting fraternity, I shall be content. And my advice to the sportsman who desires to use metal shells is, where you buy your gun try and ascertain if it has been built for the use of either kind of shell. If you have your gun already and it does not shoot to your satisfaction, get it regulated by some competent person, procure either the Starrevant or Berdan shell, put them either in a Hayden belt or a vest built for the purpose, and do not fear that you have a cordon of fire around you, liable to explode at any moment.

To those who do not care for the extra cost of using paper shells, and do not desire the trouble of carrying home the empty shells, these questions have little interest. But there are many sportsmen scattered over this broad land to whom the subject is of much importance.

HERBERT.

"MR. MACDONALD, THE WINNER OF THE CONLIN BADGE FOR RIFLE SHOOTING."—The subjoined letter explains itself. The badge referred to was shot for some eight weeks ago.—[ED. FOREST AND STREAM.]

In view of the interest taken in the rifle, and in order to create certain distinctions of merit for skill in shooting, it is my intention to distribute badges, as awards for the different modes of shooting. I therefore transmit to you a badge for "word shooting," to be given to Wilson MacDonald, Esq., he having made the best shooting at all distances, and under the rules of my gallery. The conditions under which this badge of the championship of America is given, and by which it is to be held by the present recipient, and all others who may come in possession of it, are as follows: The holder is subject to challenge for two years from the date of possession of the badge. The match for the championship to be thirty shots at suspended bullets, three-fourths of an inch in diameter; thirty shots at a bullseye an inch and a half in diameter; and thirty shots at paper targets, string measure—all at twenty-five yards, and at the word *one*—the winner of two of the three modes of shooting to be the champion; the match to be governed by rules to be entered into at the first contest for the championship.

You will please present the badge to Mr. MacDonald, and notify me of the same. Yours, respectfully,

J. S. CONLIN.

[The very handsome badge is now in our keeping, and will be transmitted by us to Mr. MacDonald.—ED.]

MAPLEWOOD, MASS., July 6th, 1874.

EDITOR FOREST AND STREAM:

I have often wondered why so little has been said in the papers about pistol practice. Would it not be well for you, through the columns of your well-known paper, to give us some idea about the size and kind of target best adapted to that class of practice, also the distance for army-size revolver, either Remington, Colt, or Smith & Wesson?

A party of four of us have been practicing of late with a Frank Wesson rifle-pistol, eighteen inch barrel, twenty-two calibre, with the shoulder attachment. We shoot off-hand, fifty-one yards, and use a common *air-gun* target, twelve inches in diameter, with half inch spaces between the circles and an inch and three-eighths bull's eye. Enclosed please find the last target used. It would please us very much if you would tell us whether you consider it passable shooting or not.

TARGET.

This target contains thirty-nine punctures, of which three have cut out the centre of the bullseye, and twenty-one others are within the six-inch diameter. There is nothing remarkable in the shooting, and a shoulder attachment to a pistol is not pistol shooting at all; it is simply rifle shooting. The size of a target for navy size revolver at twenty yards, would be a black bullseye, one inch in diameter, whole target eighteen inches across. If shooting is made at short distances with a navy revolver against an iron target, a rebound of the ball may take place. An expert in New York at the above distance, with a ten-inch revolver, Colt's pattern, at 125 feet, made six shots, measuring 10 inches. At 20 yards, 10 shots to measure 15 inches is very superior shooting.

The best revolver shooting ever made at Mr. J. S. Conlin's gallery, was six shots, 15 inches, at 125 feet; six shots, 50 feet, every bullet touching the other in a straight line, 7 inches; at 36 feet, 17 consecutive bulls rung, bullseye 2½ inches. All this shooting done off-hand, with various makes of repeating pistol.—ED.

—On Wednesday, July 15th, took place at Creedmoor the first series of competition matches for the purpose of selecting the best men for the team who are to measure weapons with the Irish. Capt. L. C. Bruce superintended the scoring. Fifteen shots were fired at each of the two ranges, 800 and 900 yards, and twenty shots at 1,000 yards. The following is the summary of the shooting:

Name.	15 Shots. 800 Yards.	15 Shots. 900 Yards.	20 Shots. 1000 Yards.	Grand Total.
General Dakin.....	49	50	60	159
G. W. Yale.....	51	46	56	153
J. Trageser.....	49	41	58	147
H. E. Fulton.....	43	44	63	146
L. E. Hepburn.....	39	47	53	144
A. Anderson.....	51	35	57	144
E. H. Sanford.....	53	43	41	140
A. V. Canfield, Jr.....	48	50	37	135
Leon Backer.....	52	36	41	132
L. M. Ballard.....	39	40	50	129
General J. R. Hawley.....	41	42	38	121
B. E. Valentine.....	35	33	35	103

The analysis of the shooting of Messrs. Dakin, Yale, Trageser and Fulton is quite good. General Dakin's score shows an average of something better than centres at every shot, being 3.18. When compared with that of Mr. S. S. Young, the gentleman of the Irish team who made 156 points in 45 shots, we find his average was 3.466. The whole score of the Irish team, when winning the Elcho shield, was as follows:

Name.	Score.	Name.	Score.
S. S. Young.....	156	J. Wilson.....	152
J. K. Miller.....	155	R. S. Joyce.....	143
J. Rigby.....	151	John Lloyd.....	143
W. Rigby.....	151	E. Johnson.....	138

We find the average of the Irish team to have been 3.319. We have, therefore, some work to do. However, the start is quite a promising one.

—On Thursday last, July 19th, the Sixth regiment, under command of Colonel Van Wyck, met at Creedmoor for rifle practice. We regret to notice that the regiment, at least the major part of it, seemed perfectly indifferent as to acquiring proficiency with the rifle. Regardless of the military instructor, the rank and file would not obey orders. At the close of the shooting, the regiment behaved in a most disorderly way. Every well-behaved military organization in the city should discredit all such rowdiness, and delinquent regiments should be ostracised. A continuation of such want of discipline must in time bring the range into discredit, and from no fault of the officers of the N. R. A. The following are the best scores:

<i>Name.</i>	200 Yards.		500 Yards.		<i>Grand Total.</i>
Private Yager, Co. C.....	3 0 2 3 3	10	0 3 2 4 2	11	21
Sergeant Koch, Co. D.....	2 3 3 3 3	14	0 3 0 2 0	5	19
Corporal Earnest, Co. C.....	2 0 2 4 3	11	0 0 0 4 4	4	15
Lieutenant Lefler, Co. F.....	2 2 2 0 3	9	3 0 3 0 0	6	15

—We are pleased to state that the marker who was hurt in a fair way of recovery. Superintendent Bostwick has recently attached discs to each of the traps covering the marker, thus indicating to the person firing when the trap is open, and thus preventing accidents.

—The second meeting for the selection of our riflemen to shoot with the Irish team, took place on Saturday, July 18. Wind variable, blowing strongly at times. The shooting was as follows, 15 shots at 800 yards, 15 at 900, 20 at 1,000 yards. The following are the best twelve:

S. M. Ballard, S. S., 800, 900 and 1,000 yards, total 155; G. W. Yale, S. S., 800, 900 and 1,000 yards, total 149; B. Fulton, R. S., 800, 900 and 1,000 yards, total 147; J. S. Conlin, S. S., 800, 900 and 1,000 yards, total 146; A. Anderson, S. S., 800, 900 and 1,000 yards, total 144; General Dakin, R. S., 800, 900 and 1,000 yards, total 144; J. Bodin, R. S., 800, 900 and 1,000 yards, total 143; J. T. B. Collins, S. S., 800, 900 and 1,000 yards, total 137; F. S. Gardner, S. S., 800, 900 and 1,000 yards, total 134; Col. Gildersleeve, S. M., 800, 900 and 1,000 yards, total 120; A. V. Canfield, Jr., R. S., 800, 900 and 1,000 yards, total 127; L. I. Hepburn, R. S., 800, 900 and 1,000 yards, total 127. Some nine other members of the N. R. A. competed in the match, M. J. Crouch making 129, but unfortunately Mr. Crouch not being to the manor born, precludes his being enrolled in the American team.

The analysis of Mr. Ballard's score, 155, gives 3.10 for every shot, being 10 better than centres. Taking the first fifteen shots of Mr. Ballard at 1,000 yards, we find it amounts to 47.133, or .133 better than centres.

—On the same day the 79th Regiment shot for the Bruce medal, range 200 and 500 yards, 7 shots at each range; won by Mr. Edmonstone with a score of 46. In looking over the score, which we append, it will be noticed that the averages are higher generally at 500 than at 200 yards:

Name.	200 Yards.	Total.	500 Yards.	Total.	Grand Total.
Private Edmonstone.....	3 2 4 4 3 3 3	22	4 4 3 3 4 3 3	24	46
Captain Lindsay.....	3 4 3 2 2 3 3	19	4 4 4 3 3 4	26	45
Private Stephenson.....	3 4 3 3 3 2	22	3 3 4 3 3 4	22	44
Private Pyle.....	3 3 2 3 3 0	16	4 3 3 4 3 4	25	41
Private Irwin.....	3 3 3 4 2 0	16	3 4 3 4 3 3	21	40
Private Keeler.....	3 2 2 2 3 0	13	4 3 3 3 3 3	22	35
Sergeant Cameron.....	3 3 4 3 2 2	19	4 4 3 2 2 0	15	34
Private More.....	3 3 2 2 2 4	18	0 3 2 3 4 0	15	33
Private Duke.....	3 3 3 4 3 3	22	4 0 2 0 2 0	8	30

The Fall meeting at Creedmoor will commence September 23d, and continue several days. The Irish team will shoot on the 26th of September.

—On Monday, the 20th of July, the Eleventh regiment, under command of Colonel Vilmar, were at Creedmoor. Order was rigidly observed, and the regiment behaved in a most creditable manner. The following are the best eight scores:

Names.	200 yds.	Total.	500 yds.	Total.	Grand Total.
Sergeant Klamp, Co. C.....	2 3 2 2 3	13	3 3 4 2 0	13	24
Private Gunther, Co. C.....	0 2 4 2 2	10	4 0 2 3 3	13	23
Captain Pohler, Co. F.....	3 2 2 3 4	14	4 0 2 2 0	8	22
Sergeant Lingler, Co. I.....	4 2 2 0 3	11	3 3 2 3 0	11	22
Private Roland, Co. B.....	2 3 2 3 2	12	0 2 3 4 0	9	21
Lieutenant Adler, Co. A.....	2 0 2 3 2	9	2 3 4 3 0	12	21
Lieutenant Colonel Hubekant.....	2 3 2 2 0	9	3 2 2 3 2	12	21
Sergeant Haaslicher, Co. F.....	3 0 4 0 2	9	4 3 3 0 2	11	20

The total scores made by the first twelve constituting the regimental team, was 246, which is a very fair average.

Answers To Correspondents.

E. L., AND OTHERS, Boston.—See answer in Editorial columns.

T. P. C.—We have not been successful in finding you a thoroughbred Cocker pup.

J. L., Galveston, Texas.—Where can I procure spoon oars and stockinette shirts? Ans. Kyle, boat builder, Harlem, N. Y. Lord & Taylor will supply the shirts.

F. G., 88 Wall st., N. Y.—Will you inform me what advantages a moccasins has over a boot or shoe? Ans. They are, or ought to be, impervious to water, comfortable to wade or walk in, easily slipped on and off, and will last a long time.

C. H. Hoff, N. Y.—Please inform me how to load a 10-bore, breech loading shot gun, 34-inch barrels, and how Wellington stands as a marker? Ans. 4 drachms of powder and 1½ oz. shot. The maker you mention is good.

A. W. T., N. W.—How is the gunning and fishing in Cumberland township, Sullivan county, and are the streams which flow into the Delaware at Pond Eddy navigable to the lakes for a small skiff? Ans. Small brook trout fishing in abundance. The only game bird in any number is the ruffed grouse. If the water is high in the streams you might get through, with a great deal of labor.

CRUSTY, Philadelphia.—Is the "Schultze" gunpowder for sale in this country, has it been carefully tested, and if so what is the decision? Ans. We do not think "Schultze" powder is for sale here. It has been successfully experimented upon in England, and is used by many field sports in preference to ordinary powder on account of its being smokeless.

S. DAVIS, N. Y.—Please state the reason why a 10-bore, muzzle-loading shot gun, 28-inch barrels, maker, Wm. Moore, kicks when I charge it with from 2½ to 3½ drachms of Hazard or Dupont powder? I have given it a trial three times and had it at a gunsmith's once, with no improvement. It shoots well, but I cannot stand the recoil? Ans. We cannot say, unless the nipple is ahead of the breech.

Tono, Albany.—Will you be kind enough to give me a receipt for killing fleas on a dog? Ans. Mix soft soap with as much carbonate of soda as will make it into a thick paste, then rub this well into the roots of the hair all over the dog's body; let it remain half an hour; give a warm bath and dry by exercise.

J. T. V. K. AGAR.—Where can I get a greyhound; one that would be sure of a fox after once getting in good sight of him; also the price of such a dog? Ans. We never heard of a greyhound running down a fox, and unless trained especially for that purpose we do not believe he would run a fox on sight; even if he were trained, we fancy the fox would have the best of it, not in a race, but in a fight. The price of greyhounds vary from \$25 to \$100.

W. J. G. D., Hanover, Mich.—What are Mr. Macdonald's prices for his setter pups, and what does it cost to import them? Do you know of any genuine Gordon setter pups in this country that can be bought, and what are the prices asked for them? Ans. From \$10 to \$25; the cost of importation would be about \$8. Read Idstone's letter on Gordons. We can procure two Gordon setter pups, never handled, nine months old, for \$50 the pair. What do you think of the Bussey gyro pigeon trap? Ans. Have tried it frequently and it affords excellent amusement and good practice.

F. W. B., New York.—Please advise me through your Correspondent's column, the best point for fishing in the Adirondacks, where there are accommodations for ladies, also the way to get there? Ans. Paul Smith's, St. Regis Lake, via Whitehall and Plattsburg, has the best accommodation for ladies, but the conveniences at Bartlett's, via Port Kent or Plattsburg, are all that can be desired, and the hotel is more central to good fishing localities.

E. S., Athens, Ga.—I have on my fish pond a number of ducks, a large puddle duck, scientific name not known. Do they destroy fish and fish spawn? Ans. All ducks will eat fish and frog spawn. We have found both in their stomachs, and in the stomachs of wood ducks. Some varieties eat more fish than others. Should say that your puddle duck would make havoc with your fish spawn, but would destroy none of the fish.

HUB, Pittsburg, Pa.—Where can I get the best trout flies and the size of hooks needed for Pennsylvania mountain streams? What flies for August 1st to 15th? Ans. Send your order to John Krider, Second and Walnut streets, Philadelphia. Always use small flies for trout and salmon, no matter how large the fish run. There are exceptional cases in which large flies are the most effective, but experience recommends small flies, and experts who formerly used large ones are now discarding them. August flies—August dun, orange fly, cinnamon fly, ibis, and coachman or stone fly for dark days and rainy weather.

H. B., New York.—1. What place at Lake Umbagog, Me., should one stop at to find good trout fishing? Ans. Go to Bethel, on Grand Trunk Railroad and take stage to Upton. 2. Can you give the name of some reliable guide there, also total expense per day for one? Ans. Charley Soule is a favorite guide. Pay for guides about \$1 per day and found. 3. Is there any other place in the above neighborhood you would recommend in preference to said lake, and if so, how do you reach it from here? Ans. Yes; at Kimball's, on Rangely. From New York to Boston, Portland, Farmington, by rail, \$11.50, thence stage to Phillips and Kimball's; total, 36 miles; fare, \$3.

J. A. B., Birmingham, Mich.—What will a sail boat cost, such as you have described in your paper, with an air tight bow and stern, full-rigged with sail, &c., to carry four or five persons? Are they durable? Ans. Do not know which style of boat you refer to. An open boat can be built for about \$5 a foot in length, sail and spars say \$15 additional. A regular centre-board, cat boat of the size you want would cost new about \$250, complete. Any well built boat is durable, if properly cared for.

DR. G., Baltimore.—Where on the Bay of Fundy is a good place to observe the highest tide, and at the same time to be well lodged and fed? Ans. At Petitcodiac, on the European and N. A. Railroad. Fair country inns. Good trout fishing in Pollet River and Anagance streams near by. Another better place, tide not quite so high, is at Windsor, Nova Scotia, on Avon River; pretty village, good hotel, no trout.

SUBSCRIBER, Boston.—Will you tell me what kind of a knapsack to take into the woods, and where can I procure one? Ans. Rubber one, with breast and shoulder straps. Go to R. G. Allerton's, Broadway and Fulton street. What clothes should I take with me? Ans. Plenty of warm woolen clothing, with an extra pair of boots. If you are not doing much tramping, a rubber bag, lacing at the end is preferable to a knapsack. See vol. 1, No. 10, page 153.

T. M. C., Lockhaven, Pa.—Can you furnish me the addresses of some responsible dealers in venison in New York and Philadelphia whom you could recommend? Ans. Robbins, Fulton Market, and Karr, Washington Market. The rifle you ask about is admirable in every way. This we know from our experience with the arm in the woods of Nova Scotia a fortnight ago.

T. J. P., Montreal, Canada.—Can you inform me of the proper charge of powder (Curtis & Harvey) and shot to employ for killing with a 14-bore, double-barrel muzzle loader, 30-inch barrels, at a distance of 30 paces, the following game:

	Answer.	Answer.
Duck (black).....	4½ drachms powder.....	1½ oz. shot.
Wild pigeons.....	3½ " " ".....	1½ "
Hare (larger kind).....	2½ " " ".....	1½ "
Grey squirrels.....	2½ " " ".....	1½ "
Pinnated grouse (partridge).....	3½ " " ".....	1½ "
Goose.....	5 " " ".....	1½ "
Plover and sandpipers.....	2½ " " ".....	1½ "
Snipe and woodcock.....	2½ " " ".....	1½ "

CLARK, Grand Central Depot, N. Y.—I am going to Canada in August and have got a Colt's revolving rifle. Would it be better to take a shot gun? Ans. We cannot say before we know what kind of game you propose to hunt. The rifle could not be altered. 2. Is Orange Lightning powder better than Hazard's for rifles? Ans. We do not know which is the best; it would cost you but a few cents to try them. 3. What would be the cost of an Indian bark canoe that would hold two, and which is the best fly for rivers in Canada? Ans. The canoe would cost about \$15, gold. We cannot say, unless we know the river you propose to whip. Try clarets and yellows.

J. F. C., Ottawa, Ill.—1. Which is the best powder for breech loaders, Hazard or Orange? Ans. The best is a good, clear powder, rather coarse grain. 2. What Nos. and of which brand for duck, pinnated grouse, quail and snipe, with price; I desire best quality? Ans. We do not know which is the best brand. We use the same powder for all game birds; for duck shooting a little coarser; size 6 or 7. 3. What book would best instruct me in care and use of breech loading shot guns? Ans. W. Greener's "Breech Loader," \$3.50; and "Glean," \$1.50.

INDEX, Battle Creek.—Wind galls, if not prominent, amount to very little. They may be dispersed by friction and bandaging, but generally return. They rarely affect the soundness of a horse. Don't know of any cure. Founder may arise from over feeding or giving food or water after excessive work. When a horse has most anything the wise and unwise call it founder. It may be alleviated in mild cases, but for regular founder it cannot be cured any more than can a galloping consumption be stopped in the man. No receipt for its cure. Give rest, bathe the feet, legs and thighs with arnica or Pond's extract. Give cooked food. Remove shoes, and put the horse on a soft floor. Patience cures a founder horse sometimes better than anything else; but then a founder horse is never worth anything after you have cured him.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INSTRUCTION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company,

AT

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,
[Post Office Box 2832.]
and 125 SOUTH THIRD STREET, PHILADELPHIA.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty per cent. for five copies and upwards. Any person sending us two subscriptions and Ten Dollars will receive a copy of Hallock's "Fishing Tourist," postage free.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, JULY 23, 1874.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Managing Editor.

WILLIAM C. HARRIS, Business Manager.

CALENDAR OF EVENTS FOR THE CURRENT WEEK.

FRIDAY, July 24th.—Beacon Park, Boston, Mass.—Dexter Park, Chicago, Ill.—Harrodsburg Trotting Association, Ky.—Annual cruise of the Brooklyn Yacht Club—Whitby running meeting, D. of Canada—Driving Park Association, Erie, Pa.—Mullen's walk at the Hippodrome.

SATURDAY, July 25th.—Practice day for cricket clubs—Trotting meeting, Manchester, N. H.—Practice day Harlem River boating clubs—Mutual vs. Hartford B. B. C. Union Grounds—Atlantic vs. Chicago B. B. C. at Chicago—Waverly vs. W. Kinsely & Co. B. B. C. at Elysian fields—First meeting Saratoga Association at Saratoga—Mullen's walk at the Hippodrome.

MONDAY, July 27th.—Atlantic vs. Chicago B. B. C. at Chicago—Brooklyn Yacht Club in New London, Conn.—Gig race—Trotting meeting, Manchester, N. H.

TUESDAY, July 28th.—Northern Ohio Fair Association, Cleveland, O.—Saratoga running meeting at Saratoga—Trotting meeting, Manchester.

WEDNESDAY, July 29th.—Practice day St. George's Cricket Club, Hoboken—Northern Ohio Fair Association, Cleveland, Ohio—Regatta of Brooklyn Yacht Club at Newport, R. I.

THURSDAY, July 30th.—Annual regatta, Stapleton Yacht Club—Northern Ohio Fair Association, Cleveland, O.—Saratoga running meeting at Saratoga.

THE UNIVERSITY RACES.

TRULY, if the scrutinizers of chances—the knowing ones—those founding their opinions on antecedents and backing them, those weighing deltoids and biceps, had made a selection at Saratoga, Princeton and Columbia would have entirely escaped their notice.

There is a sporting term unknown, perhaps, to most of our readers, expressed in the single word *fluke*, which conveys the idea of success gained by sheer accident. If not stated in the exact words, we have at least heard it intimated that both the winning crews owed their supremacy to chance. Nothing could be more unjust. We believe that success was due in each contest to pluck, courage, muscle, and skill. The Princeton crew in the Freshman race had not the lead at the start, but her men worked steadily for victory, and won it by a few inches and as many seconds. In the second race Columbia leads but a trifle at the start, holds her own, rows on unfurled, never loses a stride or stroke, shakes off her opponents, and claims the prize by a boat's length. Such a race is the hardest to win. She early asserted her position, and kept it.

As might have been expected, the favorite theory of town *versus* country is again ventilated, but we dismiss it as absurd. The argument that despises or questions metropolitan endurance does not cover the actual conditions. None of the crews, with the exception of Cornell, perhaps,

are made of agricultural components. Marked distinctions of classes, as designated by town and country, do not exist, either physically or mentally, in the United States. Our military experience has wholly disproved and refuted the assumption that city regiments could not march or fight with country boys. Such discriminations are as invidious as they are foolish.

That feature of the regatta which is to be most regretted is the foul between Yale and Harvard, emphasizing the certainty that a bitter feeling exists between the two crews.

It may add something to the fostering of a better sentiment, that both Yale and Harvard give full credit to Columbia, and in no way, by word or expression, wish to mar or disparage the splendor of the New York victory.

It is hard even to-day to decide which of the two crews—Yale or Harvard—was at fault; perhaps the exact amount of blame to be meted out to each of them may never be exactly determined. But certainly we have to rebuke what seem at present, as carefully reported to us, the words, expressions, and actions of the captain of the Yale crew.

Taken all in all, the week was one of continued unrestrained enjoyment. Students, professors, parents, ladies, strangers, the promiscuous lookers-on—all vied in being courteous, honorable, forbearing, patient, and happy. Fullest indulgence was tolerated within the limits of good sense and propriety, and all the quaint, boyish antics of the collegians became interesting by their novelty, and were dignified by the toleration of the elderly and prudish, and the participation of the more sedate. Not even the heat and dust and postponement from day to day served to abate enthusiasm or provoke impatience or malevolent criticism. There was evidently no disturbance of *ecclat* or good morals. Doubtless Saratoga will be voted a desirable locality for future regattas, and few will be foolish enough to attribute the fouls and the foibles of Harvard and Yale to disadvantages of place or condition. It may be a question whether Saratoga Lake is not more subject to sudden flaws and flurries of wind than other stretches of water, and also whether the morning hour is not altogether preferable to the afternoon for satisfactory competition; but this may be partially decided next month, at which time we hope all college dissensions may be settled and sink to the bottom. Of one thing we feel certain, which is, that the College Rowing Association is becoming too unwieldy to move with mechanical precision and continuity, or with integral harmony, and that both Saratoga and Springfield will have to greatly enlarge their lodging capacities in order to accommodate the annually increasing throngs that gather to witness the inter-collegiate regattas.

MR. SHIPMAN'S CHALLENGE TO ENGLAND.

WE publish the following challenge to English owners of pointers and setters, from Mr. Shipman of Iowa. We should wish to know, however, under what laws, rules and regulations, Mr. Shipman proposes to run this match. Whether by the English rules, which allow no points for retrieving, or by the rules suggested by us, which are now being adopted throughout the Union, which concede fifteen points for that useful characteristic in the setter.

Nothing would give us greater pleasure than to see this match taken up in a friendly spirit on the other side of the Atlantic, especially as we understood Mr. Geo. Macdona in a letter to us to state that he would probably be over here some time in August. An International Field Trial on the prairies of northwestern Iowa, over pinnated grouse, (prairie chickens) would indeed be a magnificent sight. If the match ever comes off, we will personally guarantee to find ten gentlemen who will enter their pointers and setters in an All Aged Sweepstakes open to the world, entrance fee \$100. This sweepstake with the match, would make three days of glorious sport, and would tend to improve the breed of our dogs more than all the talk in all the dog books that were ever published.

STATE CENTRE, MARSHALL CO., IOWA, }
July 18th, 1874. }

EDITOR FOREST AND STREAM:—

What has become of the International Field Trial of setters and pointers? Is it to end in smoke? Northwestern Iowa is the place of all others for such trial, and we claim Iowa has produced some of the best dogs in the United States or world.

Can not you get up such a trial, to take place in northwestern Iowa between the 5th and 15th of September next? The setter "Bismarck," frequently referred to in your journal, was raised and trained by the undersigned in this country. We will make a wager (provided his present owner consents) of twenty-five hundred dollars that he can beat any setter or pointer that can be produced to hunt pinnated grouse (prairie chickens), the match to take place during the time (5th to 15th of September) in Marshall, Story, or any of the adjoining counties of Iowa. If Mr. Price or Mr. Macdona will enter his favorite bitch Belle against Bismarck in this trial we will allow him five hundred dollars towards expenses of a trip from England here and return, and promise him an opportunity for as fine sport of the kind as the world can produce.

Yours Respectfully, V. J. SHIPMAN.

Here and elsewhere the usefulness of the English sparrows is destroyed by feeding them. There are localities where the trees are nearly stripped of their leaves, despite the presence of hundreds of twittering, chirping, droning, useless sparrows which roost every night on the branches which the worms have laid bare. There should be a law preventing the feeding of sparrows from the first of May to first of September.

THE NEW SPRINGFIELD.—Questions have been frequently asked us by correspondents, in what way the new Springfield rifle differs from the model of 1870, and whether the cutting off of the barrel would impair its accuracy and general usefulness. The ordnance officer in charge at Springfield, has kindly sent us the following replies to the questions.

The model of 1873 differs from that of 1870 as follows: The barrel is of low steel instead of iron. The calibre is reduced from 50-100 inch to 45-100. The rifling consists of three plain concentric grooves equal in width to the bands .005" deep. The rapidity of the twist is increased from one turn in 42 inches, to one turn in 22 inches. There are some other changes as to shape of hammer, screws, band, stock, ramrod, &c. The rear sight has been changed. Instead of the old leaf sight, the Enfield sight with the inclined base is used, which is placed further forward on the barrel.

The cutting off of the barrel about three inches would not affect its accuracy materially at established ranges. The only trouble would be that its trajectory would be curved, and consequently the "dangerous spaces," or margins of error in estimating distances at different ranges would be diminished. The explanation of this is as follows: If the trajectory was a perfectly straight line, it would not matter how closely we estimated the distances; as long as we aimed straight, the object would be hit. But the more curved our trajectory is the more close.y we have to estimate the object's distance to avoid passing over or under it, and the more curved the trajectory is the more he will pass over it, or under it, for the same error in estimating its distance. The trajectory of the carbine is more curved than that of the musket. Suppose we estimate our object to be 500 yards off when it is really 400, and we shoot at it consecutively with each of these arms with the sights set for 500 yards. We will pass over it in each case, but the deviation will be less in the case of the musket than in that of the carbine. We would shoot six feet above it in one case, and seven feet in the other.

For sporting purposes we should prefer the shorter arm.

NATIONAL SPORTSMENS' CONVENTION.—We have several important letters relative to the called National Sportsmens' Convention, which are deferred. It will be the purpose of this journal to further any earnest and honest effort to secure better laws for the protection of game throughout the country, and their better observance. We fear that very little can be accomplished in this direction before the 9th of September, as the time fixed is not only unreasonable, but so near as to give our sportsmen no time to discuss it.

A PRESENT FROM THE IRISH TEAM.—Col. George W. Wingate, President of the Amateur Rifle Club, was the recipient of a new breech-loading rifle, of the Swinburne model, a present from Mr. Arthur B. Leach, one of the Irish team. The weapon is a very elegant one. On the gun is a silver plate, bearing the following simple inscription: "Col. Wingate, from Arthur B. Leach, 1874." The gift is received by Col. Wingate as a token of the friendly feeling with which the Irish team regard their future opponents. We are more than pleased that the late efficient Secretary of the N. R. A., and the acting President of the A. R. C. should have been the recipient of this handsome testimonial. All we have to say is that if there is any shoot in the rifle, Colonel Wingate will get it out of the Swinburne.

ACTION OF THE N. R. A. IN REGARD TO THE LAWLESSNESS AT CREEDMOOR.—At the meeting of the Executive Committee of the National Rifle Association, on Monday last, it was determined that every possible precaution in the way of regulations should be taken to prevent drunkenness at Creedmoor. In furtherance of this end, it was resolved that after August 1st no lager beer should be allowed on the grounds. Col. Church, President of the Association, has addressed the commander of the Second Division N. G. in relation to the Twenty-eighth regiment's recent performance at Creedmoor. Gen. Shaler has also sent a circular to regimental commanders of the First Division N. G., calling attention to the necessity of preventing such disgraceful conduct. Official inquiry from headquarters at Albany has been made into the conduct of the regiment referred to.

PROVINCE OF QUEBEC RIFLE ASSOCIATION.—The sixth annual meeting of the Point St. Charles Rangers at Montreal commences on the 11th of August and will be continued on the following days. There are no less than eleven first-class prizes to be won, with over 200 prizes in all. The Strangers' Stakes, Ladies' Cup, and Small Bore Championship are open to *all comers*. Any information will be given by addressing the Secretary, Lieut. Col. Fletcher. We sincerely trust that some of the members of our Associations will enter into the list. The programme of the match may be had at the office of FOREST AND STREAM. We regret to notice the restriction made by this Association as to limiting military rifles to 50 calibre. This measurement will exclude almost all our American rifles save the Remington. The Sharp being 44, the Springfield 44, and the Ward Burton 45. We are led to suppose that if this disqualification was removed, as to American rifles, quite a number of our leading shots would be glad to participate in the match.

—We wish particularly to enjoin upon many of our correspondents the necessity of reducing the length of their contributions.

FISH STORIES.—Inclined as we may be to give credence to all kinds of stories about the devil fish, we can hardly stomach the yarn produced in the *India Homeward Mail*. The narrative tells of the Schooner Pearl off Cape Galle, pulled over by a devil fish, and all hands drowned, and the vessel sunk. The Japanese made pictures of junks overwhelmed in the same way. That the octopus, or squid, or cephalopod is much larger than was estimated, the facts told in our columns by the Rev. Mr. Harvey amply prove, but we can't accept the sad fate of the schooner Pearl. By the way, it is quite curious to see what strong stories emanate from the antipodes. The *India Homeward Mail* has inventive powers hardly surpassed by the *Virginia City Enterprise*, who told us the other day about a man who was frozen to death in the midst of the burning sands because he could not unbuckle in time a patent refrigerating apparatus he had on—*Credat Judeus*.

—It seems to be well authenticated that Mr. Keatly of Brooklyn, when bathing a week ago off Coney Island was bitten by a shark and had his thigh badly lacerated. Col. de Voe tells us that in 1865 a man swimming in the Sound, from off the schooner Catherine Wilcox, was attacked and fearfully mangled by a shark. The Greenport *Watchman* who reported the accident, said: "The case attracts attention because of the fact that the shark must have been of the species known as the 'man eater,' which are common in low latitudes, but are rarely seen in shoal water. The common shovel-nose shark of our waters seldom, if ever, attack mankind." We believe such occurrences are of rare character. The more we study the range of all kinds of fish, the wider we think it will be found to be.

Sporting News from Abroad.

[FROM OUR SPECIAL CORRESPONDENT.]

The Oxford and Cambridge Match at "Lords."
The Sales of Thoroughbred Stock. Polo
Between the Lords and Commons, Etc.

THE polo match between the House of Lords and the Commons created some excitement amongst lovers of the game, and I am no advocate of "accidental birth" and Norman descent, yet I will willingly admit that blood and breeding in man and beast generally mean pluck and perseverance, though put good education and good feeding in their place, and you will attain somewhat similar results, albeit a cart colt won't train into a Derby favorite. The Lower House played one man short, and their six opponents included the Marquis of Worcester, the Marquis of Queensberry, Viscount Cole, Viscount Downe, Lord Kilmarnock, and Lord H. Vane Tempest. The five M. P.'s were Sir Bache Cunard, Hon. T. W. Fitzwilliam, Hon. C. W. Fitzwilliam, Mr. A. D. de Murrieta, and Mr. C. de Murrieta. The latter had at first much the best of it, playing with great combination, and gradually forcing the ball away. After some desultory play, Sir B. Cunard obtained the first goal by a brilliant stroke. In the second game the Lords played determined to retrieve their losses, and after a very spirited struggle, Lord Tempest made one of the best hits of the day, and scored a goal after it had been unsuccessfully attempted by the Marquis of Worcester. After a rest, and change of points, the ball was set rolling again, and a race for the first hit resulted in the ball being jammed, honors being divided between Lord Kilmarnock and Mr. Fitzwilliam. A well-played run by Mr. C. de Murrieta followed, the goal being saved by the Marquis of Queensberry. Two goals were made on each side, the play being tolerably level throughout. Lillie Bridge is now getting to be quite a fashionable "rendezvous," and great pains are being taken to breed ponies small and active enough for this Anglo-Indian pastime, though the Dartmoor and New Forest breeds seem tolerably cut out for the purpose. The unfortunate part of it seems to be that, in the charges and scrimmages these plucky little animals are often very much cut and knocked about. The Marquis of Queensberry, whom I have mentioned, is the well known supporter of the almost defunct prize ring. He gives every year a number of silver cups, to be sparred for with the gloves by the heavy, middle and light weight champions. The cause he advocates is, I am afraid, almost hopeless. "Bell's Life" is nearly sick of it after fifty years of friendship, and though I believe the champion belt won by Tom Sayers is still at "the office," yet "The Ring" occupies a very unimportant place in the weekly sheet. The prize fighter of the present day is not a scientific gladiator, with self-control, honor and courage, but a low-lived ruffian, half bully and half coward, and very different from Mendoza and Len Caunt, or even Mace, Heenan and Coburn. The Marquis has, I think, done well in his endeavor to prevent the science of boxing from expiring, and if anything will revive and re-enoble the "P. R." it is the patronage of a man who won a severe steeple chase with a broken leg, and when but a boy, thrashed a gigantic and insolent "rough" into a cocked hat, at the expense of more punishment than that which "shut up" the celebrated Goss.

The May fly season is just over or drawing to a close, and the creels seem to have been pretty well filled this season. In many trout streams, especially those round Winchester and Southampton, the very best time of the year, the *creme de la creme* of sport is during the ten days on which the May fly makes its appearance. It goes as suddenly as it appears, and whilst it is on the water nothing else will tempt the trout. As soon as it arrives anglers have a fine time of it, and are sure to land some heavy fish and many

of them. The green drake, which is the favorite species of May fly amongst the speckled natives of the streams, is very difficult to imitate successfully, and although a hungry trout does not exercise much discernment in the choice of viands, yet when he has taken his fill of green drakes he looks suspiciously at their barmecidal imitations, unless a cunning hand has tied the feathers from the mallard's wing, and died the hackles to the exact olive tint. This difficulty in giving the blue steel Kirby hooks a delectable and inviting appearance has been got over by the suggestion of a practical entomologist. The natural transparent wings of the fly are coated with a peculiar varnish, which preserves their genuine appearance, and at the same time makes them tough and indestructible, and in this condition they are mounted on the hooks, and floating lightly down the stream, deceive the most wary. The fish that age and experience have rendered insensible of the charms of coachmen, black gnats, palmers and spinning minnows, rush eagerly at this gay deceiver, like town demoiselles to hear a new curate. I suppose you have in America your own peculiar fancies in artificial bait; but I tried last season a plano-convex minnow, made by Mr. Hearder of Plymouth, and the way it killed trout in the streams was a continual source of agreeable surprise to me, as also was its cost, some eight and twenty cents.

The sales of thoroughbred stock have been well attended, and Messrs. Tattersall have not had to send back many lots without purchasers. The Stud Company's sale realized no less a sum total than £9,570, giving an average of two hundred and ninety guineas for each lot sold, amounting to thirty-three in number. As I have it on the authority of "Bell's Life," that it pays wonderfully well to sell thoroughbreds as yearlings at £150 each, the profit could not have been much under £5,000, and as the company is only just out of debt, and was started more with a view to improve the race horse than to make much profit, the result is very satisfactory. As I glance down the catalogue I see the favorite stallions are Blair Athol, General Peel, Marsyas, and Beadsman. The success of Blair Athol at the stud has been almost equal to that of the famous Stockwell. I mean comparatively, for he has not of course had time enough. Marsyas got George Frederick the winner of this year's Derby, but for all that his stock did not fetch the high prices I had expected. Captain Machell was a very prominent buyer, and he commenced by bidding 1,000 guineas for a bay filly by Beadsman out of Eglantine, foaled May 11th. A Blair Athol chestnut colt, with three white legs and a blaze, fetched 1,050 guineas, to Mr. Peck, the trainer; and the observed of the sale was the brother to the yearling which last year sold for 2,000 guineas. There was, however, a lack of quality about him which prevented his filling the eye like his brother, and 600 was all he went for. Mr. Chaplin bought another son of Blair Athol out of Circe, at 1,200 guineas, and one of Gladiateur's offspring fell to Captain Machell at 620 guineas. The sale of the Middle Park yearlings on Saturday at Eltham produced the somewhat larger sale of 10,120 guineas, the average being 246 guineas. The death of the late Mr. William Blenkiron had rendered the fate of the annual gathering at Eltham rather problematical. It was found this year that he had a worthy successor in the person of his son, and that there was no fear of the ploughshare turning up the splendid paddocks that have been the birth place of so many steeds of fame. The loss of the original founder of the stud made necessary, however, the scattering broadcast of many gems of price, which had been collected at a vast amount of trouble and expense, but the present Mr. Blenkiron being a generous bidder for anything of real value in the equine world, he has got together a stud almost as large and well selected as the former one. The best of various lots offered was a daughter of Rosicrucian out of the dam of Blue Gown, a Derby winner who won, it may be remembered, when his owner, Sir Joseph Hawley, declared to win with another horse, and fancied him least of all his three entries. This bay filly fell to Mr. J. Porter, the trainer, at 1,500 guineas, which, being Americanized, means not less than 7,500 dollars. Mr. Chaplin went as far as 1,350 guineas, and Mr. Tattersall intimated that he had himself a telegram to give a cool thousand. A son of Lord Lyon sold at 620 guineas to Mr. J. Moon, and a similar sum was paid by Mr. Porter for a Breadalbane colt. Blair Athol, Macaroni, Beadsman, Gladiateur, Parmesan, and other famous stallions and performers on the flat, were well represented, and in the 44 lots brought to the hammer, there seemed no lack of variety in blood and breeding.

The Royal Cinque Ports Yacht Club held their channel match from Dover to Boulogne and back, under rather unfavorable circumstances as far as wind was concerned. There were fourteen yachts entered, and all but three started—comprising five cutters, seven schooners, and two yawls. The £100 town cup was won by the schooner rigged Gwendolin of 197 tons, belonging to Major Ewing.

On Saturday the Highland Brigade sports came off at Aldershot, between the Seventy-eighth, the Seventy-ninth, and the Ninety-third regiments. The sports consisted of flat, hurdle, and heavy marching order races, quoit throwing, and the usual games peculiar to the highland clans, and ancient as their old granite boulders and heirloom claymores—amongst these Scotch pastimes are tossing the caber, throwing the hammer, putting the stone, reel dancing, bagpipe playing, and the tug of war. The caber we know about, but the tug of war may be novel to you. The tug of war is generally more for the amusement of the spectators than anything else. It takes place over an artificial ditch full of muddy

water. Ten men are placed at each end of a rope which crosses this ditch, and they endeavor to pull the opposing party into it. The teams are taken from the strongest men of each regiment, and on this occasion the Ninety-third were victorious, having beaten all the rest. There were also prizes awarded for the best dressed Scotch soldiers, and the competitors were all such models of smartness and neatness that poor Sir Duncan Cameron, once a colonel in the Black Watch, of Ashantee prestige, was quite unable to decide which of the skilled warriors deserved the silver tankard. I believe it was eventually determined to call in the best looking woman that could be found as a referee. What with other headed sporrans, silver brooches set with yellow crystals, thistle pins, bog wood handled dirks and daggers, plaids and basket hilted swords, the Scotch soldiers in full costume, boast a "get up" which must have rather surprised the benighted Africans on the Gold Coast, where the men wear only a little paint and the women a broadish smile.

The cricket match between the rival universities of Oxford and Cambridge came off on Monday and Tuesday, and proved a very one-sided event. It could scarcely be called a two days' match, and the whole thing was over so soon that the spectators had to take the luncheons back, with champagne corked and the pigeon pies' crust unbroken. The first to go in were the Light Blue representatives, and they stripped (to use a turf word) in such good condition and had such fine previous form to recommend them, that it was popularly supposed to be a very close thing indeed. I may state that this was the fortieth anniversary of the match, and that Cambridge had won nineteen to Oxford's eighteen, the remainder being drawn or not played out. The only man who has made three figures in one innings is Mr. Yardley, who scored 100 in 1870, and 130 in 1872. As this match is only excelled by the boat race and Eton and Harrow contest in the public interest which it excites, the ground at "Lords" was densely packed. The result was startling. Oxford beat Cambridge in a single innings. The way the Oxford bats, especially Lord Harris and Mr. Wallroth slashed into their slows, was indeed a caution to snakes. Result—Oxford, single innings, 265; Cambridge, two innings, 109 and 64. Total, 173.

—Some of the matches of the Irish Rifle Association which took place on the 26th of last month, may be of interest. J. K. Millner won the cup, scoring 425; William Rigby took the second prize with 414; John Rigby the third with 414. Weather very bad—rain and heavy wind. At the conclusion of the match, Major Leech, chairman of the Association, made an appropriate speech. In speaking of the intended visit of the team to the United States, he said: "In reference to our match with America, I have only to express my confidence in the Rigby rifle and the Irish eye and nerve, for the greatest number of bullseyes at the longest ranges (hear, hear). We will not boast before the battle, but wish cordially that the best men may win. (hear, hear)."

—The following are the best scores made at the annual prize meeting of the City of Edinburgh, and Mid Lothian Rifle Association, at the Braid Hills on the 15th of last month: Sergeant Lamont, 7 shots, 200, 500, 600, 27, 22, 22, total 71; private B. Luke, 200 yards, 25, seven shots; Captain Hawley, 500 yards, 27, seven shots; sergeant McIsaac, 600 yards, 27, seven shots; Capt. Molineaux, 500 yards, 26, seven shots; Private Anderson, 500 yards, 26, seven shots; J. Todd, 200, 500, 600 yards, seven shots, at each distance, 67.

The selection for the English eight at last accounts, was going on. The method is, fifteen shots at 900, 1,000 and 1100 yards. It is difficult, with the new system of marking, to form an accurate idea of the shooting. According to the old method, 400 was the highest possible score, on the new system, 500. The following are some of the best scores made; Captain Screven, 438; Captain Heaten, 432; Captain Poxley, 430.

EDSTONE, JR.
FORTON BARRACKS, GOSPORT, July 17, 1874.
EDITOR FOREST AND STREAM:—

Like the Wandering Jew, unable for any length of time to remain in one spot, you will see by the above that I have once more shifted my quarters from the Emerald Isle to the southern coast of England. I have been here about ten days, and am likely to be a fixture till Christmas, when I shall get leave for the shooting. These barracks are one of our three headquarters in England, and are very large and comfortable. While on shore we are to all intents and purposes "soldiers," taking our share with the regular line regiments of all the garrison duties in the shape of guards, courts martial, etc., as I suppose your marines do also when disembarked. We have plenty of drill. I am on the parade at 6:30 A. M., drill till 7:45, then parade at 10 o'clock; drill from 11 to 12:30, and again from 2 to 3 o'clock. If the weather was warm it would be as much as one would care about; but so far there has been no summer, for though here, as elsewhere, there has been little or no rain, the winds have been strong and cool. We play cricket a good deal, and have been successful in most of the matches. Talking of that, the University match is, I see, just concluded, and though Cambridge began well, scoring seventy-four for the loss of one wicket, she has been defeated in one innings, and ninety runs to spare. Such is the glorious uncertainty of the game. The fielding of Oxford was, they say, something wonderful, and no doubt to that may be attributed in great measure her success. We are close to the Isle of Wight, and can run over to Ryde or Cowes by steamer in half an hour. The latter place is, as I dare say you are aware, the headquarters of the Royal Yacht Squadron, and a great many of our best yachts fit out there. Mr. Thellason, the commodore, has just had a new yacht built for him by Camper & Nicholson, of this place,

Gosport). Mr. T. owned the Guinevere for a number of years, and with her won a good many channel races; but he does not, I believe, intend to race his new vessel, the Boadicea by name. She is 395 tons, the largest schooner yacht, if I mistake not, on this side of the water. Her launch took place about ten days ago, and she is now preparing for sea with all dispatch. Her hull alone cost \$20,000, and by the time she has her spars, sails, and fittings she will stand the owner a good round sum. As his income is something like say £40,000 a year, or perhaps £200,000, I suppose he can afford it. Camper & Nicholson are fast becoming, if they are not already, the most popular yacht builders in this country. The Cambria and Livonia, both of which took part in the ocean race some years back, were launched by them, and one of the firm told me last week that they have as many orders as they can fulfill for the next two years. One gentleman has commissioned them to build a 500 ton schooner regardless of expense. Very truly yours, LIEUT. W. H. POE.

—We have by telegraph received the announcement that Scotland won the Elcho shield at Wimbledon on the 17th of July. England was second; Ireland was third. The latter fact may, to use a popular expression, put a little more starch into our own men.

Sea and River Fishing.

FISH IN SEASON IN JULY.

Salmon, <i>Salmo Salar</i> .	Salmon trout, <i>Salmo confinis</i> .
Land-locked Salmon, <i>Salmo gairdneri</i> .	Michigan Grayling, <i>Thymallus tricolor</i> .
Black Bass, <i>Micropterus salmoides</i> .	Sea trout, <i>Salmo immaculatus</i> .
Striped Bass, <i>Morone saxatilis</i> .	Weakfish.
Bluefish, <i>temnodon saltator</i> .	

—Weekly arrivals of fully 200 boxes of salmon averaging 150 pounds each, making a handsome total of some 30,000 pounds, keep up the supply of the big city. Whether the physical conditions of the crews at Saratoga, or the mental capacities of the visitors at the springs require this peculiar salmon diet, we are unable to determine. The only fact we record, is that the demand for salmon and fish in general, is enormous at Saratoga just now. Salmon worth only twenty cents a pound. Bass in profusion, coming from Cuttyhunk, a shade cheaper than last week. Spanish mackerel arriving more freely from Long Island, sixty cents a pound. Now the true mackerel is approaching his prime, coming from Boston to this market, and selling at from fifteen to eighteen cents each. Sheephead scarcer than when last noted, worth twenty-five cents. Blue fish are coming from everywhere and worth six cents. Black fish increasing in size and quantity on the slabs, and sold at ten to twelve cents. Halibut not plenty, a temporary scarcity not exactly accounted for. Worth twenty cents. Prime Jersey lobsters, some 2,000 pounds a day coming in. They will average eight pounds and are selling for ten cents. Soft crabs scarce. Worth \$2.50 a dozen.

—Long Island waters both outside and in the Sound seem bare of blue fish. A boat from the "Blue-light" (U. S. Fish Commission) went last week outside of Montauk Point, nearly to Block Island, starting from New London—day fine, breeze good, but no blue fish.

A dozen mackerel and a few flounders caught on Shagwana Reefs while anchored on bar in a calm, was one day's work. The report from Fisher's Island Pound—drawn next afternoon was, "not a blue fish." Bass, "chequit" (weak fish) and flounders were about the stock.

—A good haul of mackerel—7,000—was made at Smitty Nose Island, Isle of Shoals, N. H., on Tuesday of last week.

—Smelts are now being caught inside of Black Rock, North Cohasset, Mass., with hook, line and pole. The bait, shrimp, is at present quite scarce. The catching of these fish, which are excellent eating, furnishes hours of sport to many an Eastern angler from now through the fall and winter months.

—Blue fish are reported to be never so plenty as now, at Nantucket and in Buzzard Bay. The fine sport of hauling them in is being enjoyed by numerous parties. Many large catches are recorded.

—The membership of the Squidnocket Club is comprised in Messrs. J. Baush, W. L. Barker, Ed. Phalon, and James L. Flint, all of New York. They own a fine club house and fishing stands at Marthas Vineyard. During this month they have taken over 600 pounds of striped bass with rod and reel. The largest one caught by Mr. Flint, weighed thirty-four pounds. The total catch of the club last year was about 6,000.

—A letter from Mr. Fred Mather, who is now attached to the United States Fish Commission, dated at Holyoke, Mass., 9th instant, says:—"Seventy-three shad caught yesterday with fly from bridge and many from boats; water down now and shad plenty. Now is the time for parties to be here. Best fishing from four to seven P. M."

—Here is the latest news from Jersey:—

ATLANTIC CITY, N. J., July 18, 1874.

EDITOR FOREST AND STREAM:—

Whether the absence of fish here is due to the constant hauling of seines, or to some other cause, one thing is certain, that, save an occasional flounder, a half dozen sheephead, or a very few very small weak fish, nothing worth catching is to be found. On Thursday last several fine drum fish were taken, but none since then. "Outside" the chances are better. I tried it on Wednesday, Thursday and Friday last, each time succeeding in bringing in a fine

lot of splendid black fish, ranging from three to six pounds, a and single sheephead, all taken with a light line, and a light rod. But it is as much as any other than an old salt can do to retain his "vittals" at the wreck where we fish.

Atlantic City is a nice place for those who like comfortable hotels and first class bathing, but until matters improve, to be regarded as an indifferent place for fishing.

A. M. S.

WARETOWN, BARNEGAT INLET, July 16, 1874.

EDITOR FOREST AND STREAM:—

Blue fishing has been unusually fine here this season; for quality and size of the fish beyond anything known for years. The season generally begins about the 15th of May, but this year the first fish were not caught until the 23d, and since then thousands have been thrown away, and still the number seems not to diminish. Mr. Kinzey, proprietor of the Ashley House, makes this standing offer to his guests, that whoever comes to his house for the purpose of fishing and does not take a hundred pounds per diem, shall enjoy all the hospitalities of the house free gratis, but no one has had his board for nothing yet. Wednesday July 8th went ahead of any fishing known for years. Old fishermen tell me that they never remember any such a time. The channel runs close to the shore, about 150 yards from the house. This was lined with men, women and boys, all throwing the squid from the shore and hauling in fish. Over two thousand were taken, averaging seven pounds in weight.

Sheephead fishing has been fair thus far, but no large catch has been reported. Weak fish have commenced biting, but this fishing is never good while the blue fish continue in the bay. One party caught seventy-five yesterday, and I hear of their being caught in considerable numbers. Black fishing from an old wreck lying in the inlet has made considerable sport; this is a new ground, Mr. Gaskall, keeper of the light being the discoverer. He caught fifty-six one day not long since, one that I saw weighed eight pounds.

A. BRICK.

NEW SMYRNA, FLA., July 3d, 1874.

EDITOR FOREST AND STREAM:—

Our winter visitors think they have fine sport fishing, and I presume they do, but in the summer and early fall we have the best sport. Bass are now caught in abundance, I was crossing the inlet a few days since and a very large pompano jumped into the boat, striking me on the left shoulder with such force as to render my arm helpless for several days, and it was with the greatest difficulty I sailed my boat home. I see you quote pompano for one dollar per pound. I doubt not our fishermen would be glad of a market at twenty cents per fish.

Why do not some of the clubs in New York buy a tract of land here, erect a club house, plant an orange grove, and have winter quarters, plenty of game and fish, &c?

Truly yours,

GEO. J. ALDEN.

The Racquette and all the rivers of the northwestern part of the State, are bank full, interfering materially with the trout fishing this season, but laying up a splendid store of fine fish for the next. There will be no first rate river fishing until the trout gather around the mouths of the cold brooks next month.

—Mr. W. M. Cole, of the Brooklyn Board of Education, one of a party of three gentlemen who took their families to Twin Lakes, Ct., last week, upon our recommendation, reports having made a basket of 145 good trout in one day's fishing in the neighboring streams.

—We are permitted to print the following letter from Dr. Frank Clerk, the lessee of the Grand River in Gaspé, Canada. Gaspé is the peninsula formed by the river St. Lawrence and the Bay Chaleur.

CAMP ON GRAND RIVER, June 29th, 1874.

I feel very glad that Sunday has arrived. I never felt the wise provision for man more sensibly before. I was completely tired out; all my body, arms and legs ached from the constant run of salmon.

To-day I commenced with one opposite the camp before breakfast. I found fish in every pool as far as Pool Prince; I caught to-day in all about 12 salmon, the largest 21½ pounds; in five days' fishing I have landed 52 salmon.

I find the double hooks of great advantage; I certainly save more fish after they are hooked than with the single hook. I take fish with all kinds of flies, but the most successful, I think, are wild turkey wings, with jungle fowl body, black silver tinsel hackle, black, with grey tips and golden pheasant top-knot at the tail of the fly.

Tuesday, 30th, an easterly storm with rain; fished a short time; caught, 6 salmon, 3 in the pool at the rock below the camp, and 3 in the pool below the branch stream on 29th.

Wednesday, 1st July, went up, caught one of 25 pounds in the camp pool, one in the branch pool, 4 in the fine pool above the chain of rocks, one in the blue ledge pool, three in the ledge opposite the upper camp, one in pool Bruce, none in the Grand Pool, although it was full of salmon. I lost my flies twice with salmon running foul of rocks; eleven in all. Up to date, including 1st July, 70 salmon.

—At Port Rowan, Canada, July 21st, sixteen persons were arraigned before a Bench of Magistrates, and fined for violating the Fishery Act during the close season.

FLY-FISHING FOR BASS.

BOSTON, Mass., June 28th, 1874.

EDITOR FOREST AND STREAM:—

Spending last summer near that beautiful lake—Champlain—and often catching bass when trolling, the thought occurred to me to try for them with a cast of flies. I had some made and sent to me by Mr. Prouty, of the celebrated house of Bradford & Anthony of this city. The good people with whom I was stopping rather laughed at the idea of catching bass with the "rigging" I proposed fishing with (12 oz. rod, and reel holding about 300 feet of line). Nevertheless, I started early next morning, before the sun was up, and repairing to the lake launched my light Adirondack boat and pushed off. It was a beautiful morning. A light haze, with a gentle breath of air from the north—just enough to make a little ripple on the water; in fact just such a morning as could be desired for the trial I was about to make. After a short row of perhaps twenty minutes I reached a point putting out into the main lake, composed of slate, which rose abruptly from the water some fifty feet. This point, around which I had many times trolled, and always with success, had many advantages. The water was deep and the base was composed of layers of slate, in whose niches the black bass love to lurk; the high bluff kept off the wind, and the water at the side for some distance was as quiet as a mill-pond. I gently pulled out a little distance from the rocks and up pretty well toward the head of the point, where I could reach the eddy made by the waves washing by the point, and casting my flies

brushed the still water close as possible to the wake. I had hardly steadied myself to my work when the water broke, and on straightening my line I felt that a fish was hooked. No sooner had he felt the hook than away he went almost to the end of the line. Fearing for the rod yet not willing to lose my fish, I snubbed him gently. He resisted and I gave him the but hard, when with a spring he cleared the water a good two feet in the air, showing to me the dark back and polished sides of a good three pound bass. I was elated and highly pleased with this mode of fishing. No sooner had he struck the water again than with a sudden turn (peculiar to this fish) he came directly toward the boat. Then came work. How I did labor to reel in! My hand seemed as though it was incapable of action, so slowly did the slack of the line seem to take up! At last, just when it seemed that I must succumb, he suddenly turned and dashed away from me and then I breathed easy. In a moment more I had him well in hand, and once more began to enjoy the play of this splendid fish. What breaks he would make! Several times he was out of the water trying to shake loose the hook, but it was of no use. As last he began to show signs of exhaustion, and finally rolling over and over, he lay comparatively quiet on the water. Gently reeling him in toward the boat, I at length got him within easy reach of my gaff, when in stooping to reach the handle he seemed to realize what was in store for him, and the knowledge seemed to awaken him to one more effort for freedom. With the quickness of a flash he was away again, with as much freshness apparently as ever. Going to the end of the line he cleared the water, but with great effort, for as he fell again he gently rolled up on his side, and with a motion or two permitted me to reel him toward the boat, into which I took him with no effort on his part to escape. In lifting him into the boat he never moved, and upon examination I found he was dead. He had fought to the death, which I afterward found was so in almost every case. For two hours I cast with results far beyond my expectations. My catch amounted to 12 bass and 3 large perch. The bass averaged over 2½ pounds each.

Many mornings after was I on that ground, and never without success. That summer has made me a firm advocate of fly-fishing for black bass, and the good people with whom I was stopping no doubt will this summer use the same tackle in fishing for bass that I did, for at their request I left them mine.

I have a few of the flies left which I used, and would only be too happy to send you a sample from which to describe to your numerous patrons the fly which I know to be successful in fishing for bass in our northern waters, as several others have used them with success elsewhere, I having put myself out to test the reliability of the fly in other waters. Should any of your readers desire further information on this subject I should be pleased to correspond with them, and Mr. Prouty will also give his personal attention to the making of these flies for any desiring them.

"BLACK BASS."

BLACK BASS FISHING AT WEST PORT.

EDITOR FOREST AND STREAM:—

About sixty miles from Whitehall, on Lake Champlain, upon a bluff shore, stands the village of West Port. Nestled in the palms of surrounding mountains with the lake outspreading at its feet, the quiet loveliness of its situation has a fertile charm for us "poor fellows," who are ahint after "broad fields and babbling brooks." Such, at least, was its effect upon the writer, as our party sat upon the hotel porch awaiting a private conveyance to take us 20 miles due west into the Adirondacks pure. Accident had delayed the team, and the wait became tedious, when we heard, incidentally, that a trout stream was dashing down the rocks within a hundred yards of the hotel. In fifteen minutes I had jointed rod, adjusted reel, pocketed fly-book, postponed visit west for 24 hours, and was making lively casts right and left over the wafers of the brook. For an hour, without reward, I patiently whipped the stream, until a spot was reached where it poured over its rocky bed into the lake. The brook at this point was only two to three feet deep and about seventeen feet wide, with a broad meadow on either side. Standing back upon the right bank I made a cast into the centre of the stream, allowing, from negligence due to a long want of success, my flies to sink below the surface. In an instant a heavy bite was felt, and upon quickly withdrawing the line from the water, I found that the leader just below the second dropper was carried away. Big trout, these, thought I! The two flies lost were a white miller and red hackle. Hastily adjusting a new leader (double gut) with single fly (white miller), it being nearly dusk, a cast was made and the response was immediate—a heavy thug, a surging dash, then three feet into the air, and to my astonishment I found in lieu of a trout, a three-pound black bass had been hooked. An active play of ten minutes landed him upon the meadow. In about 30 minutes eight black bass were basketed, running from 2 to 3½ pounds each, with a single fly on a light trout rod. It was glorious sport. Thus did I go a-fishing for trout and brought home black bass.

I have been minute and doubtless tedious in description, yet the excuse lies in the fact that my short half-hour's bass experience on that summer evening has opened for this section a new delight—to wit: black bass fly-fishing. The minnow has been used here exclusively; and deep water fishing only followed, and the lively interest and thorough astonishment of the resident fishermen at the sight of my fine string of fish was only equalled by their looks of incredulity when informed that they were caught with said white miller and the rod before them. Of course these remarks apply exclusively to the waters adjacent to West Port, where a fly has never been used, and a brace of bass was considered good luck in a morning's fishing.

The waters abound in pickerel and perch, as well as black bass, and afford most excellent sport for the general fishermen, but it is especially virgin ground to the fly caster for black bass, and as such he may expect noble sport, not forgetting bodily comforts at a good hotel, the landlord of which, Mr. Nichols, will extend a cordial greeting and every facility to the sportsmen who visit this section.

The route to West Port from New York is via Albany and Saratoga to Whitehall, thence by steamer to West Port. Time, 14 hours; fare, 88¢.

W. C. HARRIS.

—W. Holberton, the trout painter, sends the following notes of a summer jaunt in Pennsylvania:—

"One day last June I happened to take up a book on a table in the parlor of the Ralston House, which turned out to be the map of Lycoming county. In looking over it I saw that a stream, the lower part of which I had often fished, headed a few miles back among the mountains and could be reached by a tramp up the hills quicker than by going down the valley eight miles to the mouth, then five or six more to the forks near the head. I soon found a companion to join me and a few days later we started on our trip.

We left the house before sunrise, and while the inmates of the house were yet asleep. We were prepared for a two day's trip if it were necessary to stay that long, for there was no path, and none had ever gone that way before us. An hour's sharp climb brought us to the top of the mountain, where we met the first rays of the sun. The view was charming; the valley lay in shadow, with here and there the blue mist floating about. A thin column of smoke rising from the houses was the only sign of life. We rested under the tall hemlocks for a few moments admiring the scene. We started again on our route, which lay through an old, deserted clearing, with here and there a tumbled down log cabin. Once it was a busy place, when in old times the mines were working, but now it is a famous runway for deer, rarely visited, excepting by hunters.

We kept on across the mountain down to a little valley, over a tumbling stream, up again the other side, and after three hours of hard work we overlooked the valley of Gray's Run. We came entirely by the compass, and proved the map to be correct, excepting, as my companion remarked, "the scale ought to read five miles to the inch instead of one." We started several families of ruffed grouse, saw several signs of deer and a couple of porcupines, and going down the last mountain followed a rather too fresh bear track for several hundred yards. We were right glad to reach the stream, and were soon at work. The trout were plenty

but small, owing to the low water, for we afterwards discovered a great many large ones hidden away under the saw-logs. At noon we stopped and built a fire and I cooked some trout in the ashes wrapped in buttered paper (the only way to eat them), with which, aided by a bottle of claret, we made a right good meal. The stream was bordered with laurel and rhododendron in full blossom, and anglers know how charming they look. I think there is nothing so pleasant or beautiful as a good trout stream away in the woods, particularly after a good roast and a bottle of claret. With our pipes a-going we slowly fished down stream, stopping occasionally to have a tussle with an unusually big trout or to admire a beautiful view, until we found ourselves down to familiar ground. It being yet time to catch the evening train by a short walk of a couple of miles, we unjointed our rods, wound our leaders around our hats and started. We were a tired pair of mortals that evening, but proud of our exploits, and held forth sagely to our friends around the supper table of the Ralston House on the dangers and success of our trip.

W. H.

BOTTLE vs. JUG FISHING.

EDITOR FOREST AND STREAM:—

An article entitled "Jug Fishing" in a late number of your paper reminds me of something in the same line, which is, perhaps, a more scientific, though equally unsportsmanlike mode of fishing. I use bottles instead of jugs to decoy the finny families. The "science" consists in winding a sufficiency of spare line around the neck of the bottle and then inserting it in a notch made in the cork sufficiently firm to hold it against the struggles of the small fish used for bait, but easily drawn free when the large fish takes hold. This is the *modus operandi*: Being provided with a dozen or so of empty bottles—champagne or claret the best—cork them tightly and fasten a line of suitable strength to the neck of each, winding the spare line upon it, leaving enough free that the hook may clear the weeds and bottom of the lake or pond where used; bait the hook with a live minnow, insert the line in the notch in the cork and throw bottles and bait overboard on the windward side of the proposed fishing ground. Off go the bottles "bobbin' round" every ripple, keeping things lively. Presently a big pike or bass take a pull at the bottle, frees the line from the cork and sets things spinning. Round and round whirls the bottle till the spare line is paid out; then dips, hobs, plunges, now under, now out, and always keeping a taut line on the "bottle-holder" below. Of course you go for it, and generally the fish comes up well "tucker'd out," as the saying is. With a dozen or so of these new fangled trippers afloat, and plenty of game fish about, this is a lively style of fishing; and though it lacks the nice dexterity of the light rod and fine tackle that makes bass fishing so enticing, it has the merit of spreading over a good deal of ground and putting the bait a great distance from the boat. At any rate on our beautiful twin lakes it is found so killing a method of angling that one cold-water man contemplates putting up a notice to the small fry not to take too long or strong a pull at the bottle.

—Annual Regatta of the Manhattan Yacht Club was sailed last Thursday from the club house foot of Eighty-fourth street, East river. The course was from the starting point off the club house to and around the buoy off Throgg's Point and return, making in all a race of about sixteen miles. The competing yachts having been anchored in two lines, at 10 m., 50 s., the preparatory gun was fired, and at 11 h., 1 m., 45 s., the second gun started the smaller boats. Jibs were at once mast-headed and chains slipped, and in doing this the crew of the Skip Jack worked the smartest. However, it availed them not, for the Zephyr, wearing around, ran inside her opponent and took the wind. Five minutes after the small yachts were off the third gun started the first class yachts, and with the wind from the westward and tide on the last of the flood, away went the fleet, booms to starboard and jibs boomed out to port. As the yachts came between the Brothers Islands, it became apparent that the Skip Jack had regained lost advantage, and was now leaving her competitor. While off the larger boats the "Mary Gibson" appeared to be having the best, it leading the Crombie, which, in her turn, was ahead of the Emma Sophia and Lanthier. From here to Throgg's Point there was no change in relative positions, rounding the buoys as follows:

	H. M. S.		H. M. S.
Mary Gibson.....	12 14 00	Skip Jack.....	12 13 48
T. J. Crombie.....	12 14 17	J. N. Lanthier.....	12 14 50
Emma Sophia.....	12 14 45	Zephyr.....	12 15 00

In turning the buoy the yachts went around so close that the Lanthier and Gibson fouled. The latter keeping off at once, rounded the second time, but, of course, lost her position by so doing. All the yachts turned towards Fort Schuyler, and going off on the starboard tack, began their beat for home.

The Emma Sophia had had a reef down in her mainsail all along, and it now was of great service to her, for as the yachts hauled on the wind the breeze was found much too fresh for whole sails. In a couple of tacks the Emma Sophia had taken the lead, followed by the Skip Jack, Mary Gibson, Lanthier, Crombie and Zephyr in the order named; and so they continued, the wind being dead ahead and the tide just beginning to make in their favor, until, tacking off Westchester creek, a squall struck the Emma Sophia, and her weather jib sheet having gotten jammed under some sand bags, she was very shortly on her side and out of the race. From here to the finish all the helmsmen had their work cut out for them to keep their vessels on their legs. The following is the result of the race:

FIRST CLASS.

Yacht.	Start.	Finish.	Elapsed Time.	Corrected Time.
	H. M. S.	H. M. S.	H. M. S.	H. M. S.

—At the regular meeting of the New York Yacht Club, held at their rooms last Thursday, a letter from the Phila-

delphia Club was read, containing an invitation to visit Cape May at any time previous to Aug. 1st, and offering for competition two cups—one for schooners and the other for sloops—valued at \$1,000 and \$500, respectively. After some discussion, the invitation was declined, with thanks, as the time previous to annual cruise is so limited. The cruise was then fixed for Aug. 4th, on which day the yachts of the club are expected to rendezvous at Glen Cove, when further orders will be issued by the Commodore. The following resolution was then unanimously adopted:

Resolved, That the sum of \$250 be appropriated for a prize for steam yachts to be competed for at Newport during the annual cruise, if there are three or more yachts to compete, under such regulations and with such allowances of time as the committee may decide upon.

After some further routine business the meeting was adjourned.

—Yacht Nettie, Capt. Comstock, of the New York Yacht club, was at Halifax, N. S., July 16th, bound for Newfoundland on a hunting and fishing excursion, with canoes, Indian guides, and complete outfit. Passengers were Rev. George H. Hepworth, George E. W. Stevens, E. S. Butler, A. C. Arnold, all of New York, and A. A. Ranney & Son, of Boston. The run from Portland to Sambro Light was made in forty hours. W. Roche, Jr., of Halifax, placed his dock at her disposal.

—The Stapleton Yacht Club have for the second time been compelled to postpone the date of their annual regatta. Commodore Tynan has now returned from the West, and Thursday, the 30th inst., has been definitely fixed for the race.

—Mr. Langley, of the schooner yacht "Comet," has challenged Mr. Voorhis, of the "Tidal Wave," for the Bennett challenge cup, held by that yacht, and it is probable the race will come off during the annual cruise.

—The annual review of the Boston Yacht Club took place on Saturday, July 18th, off City Point, South Boston. Of yachts in line over and including forty feet in length, were the Curlew, America, Wivern, Lydia and Tempest; the Curlew flying Commodore Dean's pennant. These drew into line 100 feet apart; with the second class yachts to windward, which included the Nina, Lillie, Kelpie, Rebie, Mary Ellen, Wanderer, Alice, Agnes, Enigma, Fannie and Pearl. At a given signal the Commodore boarded Captain Arthur Cloney's steam launch Anemore, and made the rounds of the fleet, each yacht dipping the club signal as he passed. At the conclusion the yachts got under weigh, and dropped down to the rendezvous at Hull harbor. On Sunday morning they started on their cruise for Gloucester.

CRUISE OF THE YACHT STARTLE.

GARDINER, Me., July 8th, 1874.

EDITOR FOREST AND STREAM:—

Having promised to write an account of our cruise for your paper, we send you this letter. We left Boston (City Point) Tuesday morning, June 23d, about eleven o'clock, intending to make Gloucester our first stopping-place. It having allowed a gale the night previous we encountered considerable swell on getting outside. Our sail to Gloucester, however, was a very pleasant one, and made under an all sail breeze and a fair wind. About four P. M. we arrived at Gloucester. There we found the yacht Banshee, Captain Orcutt, awaiting our arrival. It had been arranged previously that the two yachts should sail in company to Portland. At ten o'clock next morning we set sail for Portsmouth, taking a straight course from Thatcher's Island to the Isle of Shoals. The wind freshening all the time soon compelled us to run under double reefs. Being favored with a fair wind, we reached Portsmouth at five in the afternoon. Soon after getting in, the yacht Caloric, of Boston, came in. This yacht is one which went to Florida last fall and was brought back to Portland on a schooner's deck this spring. She attempted to beat up to Gloucester the same day we ran down, but encountering a head wind and heavy sea had carried away both main stays, filling her half full of water and compelling her to run back.

Rain and fog delayed us at Portsmouth till Friday morning. The morning opened foggy. About half-past nine the wind had shifted. It had been agreed that York should be our next harbor, and for that place we headed. We started with the sun out and our topsail set. Just before we reached York a thick fog set in. We never lost sight of the land, and not daring to run so near the shore, headed directly out to sea; took our topsail in and kept on. In a short time the fog lifted enough to enable us to distinguish a large hotel at what we thought must be the entrance to York harbor; put about and ran in. Soon saw a man fishing in a small boat off shore. From him we learned that it was York harbor. It looked a risky place to get in, I can assure you, nothing but a line of breakers. We could do nothing but attempt it, however, as the fog was again settling and night was approaching. When about a mile from the entrance the wind left us, the heavy swell knocking what little there was completely out of our sails. As the flood tide was setting us rapidly on the rocks, we got out an anchor at once. At this time we started the traveler from our boat, as we were pitching about at a fearful rate.

Captain Orcutt having reached the harbor safely before the fog set in had discovered our situation from the shore, and put off in his small boat to help us. A slight breeze springing up we decided to attempt getting in; we up anchor and headed in. Did very well in one tack, but being obliged to stand off shore, found we could do nothing against the heavy swell. We dropped anchor again, and then got out another anchor to warp us off shore. After pulling out to this anchor we tried it again, but with no better success. The next attempt, however, was more successful. After getting in stays once and having to throw the anchor to bring us round, we got in.

The tide sets so strongly at this entrance that it is only on the ebb and flow that a vessel can get in and out. We lay in York harbor from Friday night till Monday morning, when we set sail for Portland. Owing to the delays we had Captain Orcutt concluded to go no further. The run to Portland was made under double reefs, and was made in seven hours.

We met there several members of the Portland Yacht Club, who very kindly offered us their attentions. While there we had the pleasure of seeing a young lady yachtswoman. This young lady owns and sails the yacht Spy, a sloop yacht of ten tons. She employs a skipper on her yacht, but herself handles the tiller at all times.

We were joined at Portland by one of our friends, who is a fellow yachtswoman, and who was to skip us up the Kennebec. Tuesday morning we left Portland for the Kennebec, a run of only 25 miles. Here we had our first experience of rough weather. Had a good stiff breeze on starting, but soon were compelled to put in the double reefs. We were beating dead against wind and tide, and at five in the afternoon were five miles from Bold Head. The sea growing rougher and rougher we found we could make no headway against it. In reefing jib we were doused clear to our shoulders every time we pitched. It was accomplished, after a hard struggle, however. It getting late we decided to make a harbor as soon as possible. Seeing some vessels running in on our port hand we headed after them, and soon found ourselves in Small Point harbor. We got in none too soon, for it began to blow a gale and the rain came down in torrents. The next morning being pleasant we again set sail for the Kennebec. After experiencing a dead calm and another blow—even worse than the one of the previous day—we reached

the Kennebec as wet as drowned rats. With the exception of a race up the river with a Bath yacht, and being well stared at, our sail was without interest.

At two o'clock Tuesday afternoon we arrived at Gardiner, where we have been ever since. We were at once surrounded by a crowd of anxious friends, and for the next two days did nothing but shake hands and answer questions. Yours,

C. S. P.

—At the Quincy championship regatta, which took place at Quincy Point, Mass., on Saturday, 18th inst., thirty-two boats started. Of the first class boats the India and Lena took the two prizes; of the second class, the Marie, Wild Fire and Aurora took the three prizes; of the third, the Frank, Dolly Varden and Fanny, the three prizes; of the fourth, the Romp and Lottie two prizes.

—The Eastern Yacht Club, of Boston, will rendezvous at Holmes Hole, Vineyard Sound, on Tuesday, August 4th, and start on its annual cruise. Yacht owners intending to participate should give notice to the secretary at once.

—The British yacht Marcia, hailing from Cowes, owned by the Earl of Clairville, and in command of Captain Warder, arrived at Boston on Monday week from La Have, N. S., with a pleasure party on board.

—It is reported that the schooner yacht "Wanderer" is to have her centre board trunk removed, and to have additional keel given her.

—The schooner yacht "Magic" is to have an overhanging stern, which will lengthen her on deck about ten feet.

—The committee having charge of the arrangements for the schooner Corinthian race at Newport have decided upon the 8th of August for the regatta, as being the most convenient day. It is expected that the Eastern and Boston yacht clubs will muster at Newport in force. The New York Club, by the programme for their cruise, will all be there, and as the annual cruise of the Brooklyn Yacht Club has just commenced, it is probable that their yachts also may be well represented.

—The second regatta of the championship series of 1874 of the South Boston Yacht Club took place July 17, and was participated in by four keel and nine centreboard yachts. Maud won the race, and, having won the first race of the series, is entitled to the championship medal—a gold aneol. Fearless was the winner of the first prize—a barometer—in the second class keels. Actual time of sailing—Maud, 1 h., 7 m., 30 s.; Fearless, 1 h., 12 m., 21 s.

—The International Regatta, under the auspices of the Dominion Rowing Club of Toronto, took place July 16th. The single scull race of two miles was won by R. Tinning; C. Nurse second. The second race was for four-oared boats, distance four miles; first prize, \$300; second, \$150. Entries—Clipper, of Pittsburgh; W. Weston, of Buffalo, and New Dominion, of Toronto. The first named was the winner, the Buffalo boat being second. The New Dominion led until within a quarter of a mile of the winning buoy, when she broke her rudder. The double scull two mile race was won by Atlantic, S. Williams stroke; Water Lilly, C. Nurse, stroke, second. The single scull race of two miles was won by Edward Hanlon, Sam Williams being second. The four-oared race of four miles was won by the John Strachan, of Toronto; William Dillon, stroke. The double scull race of two miles was won by Atlantic, W. Cann, stroke; Eureka, T. London, stroke, second. In the skiff race, three-quarters of a mile and return, C. Pearl-sall was first, W. Barchard second. In the single scull race of two miles, P. Luther was the winner, Thomas Loudon second.

—The yacht Narragansett, of Boston, Capt. Tufts, arrived at Bucksport, Me., on Thursday 16th, all well, and on Friday for Vinalhaven.

THE FRESHMAN RACE AT SARATOGA.—This opening event took place on the 15th. The following boats entered: Brown, Princeton and Yale. Brown holding the central position. The start took place at 5:28. Yale seemed to get first under way, pulling some 32 to the minute, and before 150 yards were gone over, was a trifle in the lead. Brown and Princeton were making at about 36 strokes to the minute. At the mile boat Yale still was ahead, Brown at her heels, and Princeton a boat's length astern. A quarter of a mile further on Brown was lagging, but still it was so far anybody's race. Presently Princeton and Brown and Yale quickened their efforts, and at the two mile stake boat the Princeton crew commenced to show their powers. Spurring brilliantly she was now stern and stern with Yale, and struggled not only to keep the space with her but to lead her. Brown seemed now to lose heart lost precision and lost ground. Just off Harvard's head-quarters the last struggle took place between Princeton and Yale, and now they were coming in to the close, going faster and faster. Within hardly three hundred yards of the finish the Princeton crew were called on, and nobly did they respond. The blues did their best, but the yellow turbans were doing better. Princeton's bow was slid in ahead, and New Jersey won by but a few inches.

Time of the winning boat, 18:12½. Last year Yale won the race in 17:59.

Single Scull Race.—Two mile race. Entries E. L. Phillips, of Cornell, A. Wilcox, of Yale, A. L. Devens, of Harvard. Start took place at 6:40. Devens drew out first but Wilcox held on steadily, and so did Phillips, the latter getting ahead, but going out of his course. Homeward Harvard also made an error; Wilcox coming steady with even stroke kept on his way, lengthening the gap, and finally landed his boat, a clever winner in 14:12½, two boat's length ahead. Devens second and Phillips last.

SARATOGA, June 18.—After two days' delay, caused by bad weather, the great inter-collegiate race took place on Saturday last. The following boats started: Columbia, Wesleyan, Harvard, Yale, Dartmouth, Cornell, Trinity, Williams and Princeton. At 9:45 the first gun was fired, at 10:20 the second, and the starting gun at 10:47; all the boats getting well off together. The position at the start being on the east side of Lake Saratoga. Nearest in shore was Trinity, then Princeton, Cornell, Yale, Harvard, Wesleyan, Columbia, Dartmouth, and Williams in the extreme west. All the boats took the water handsomely, Columbia at the half mile taking the lead; then Trinity made a spurt, challenged Columbia, and at the end of the mile took the lead from Yale, who was ahead; then a foul took place, which cut Yale out, and brought Princeton close behind Trinity; about a mile and three-eighths from the start Columbia still kept the front, Harvard spurring manfully, Columbia still holding the lead; Cornell working

Rational Pastimes.

Secretaries and friends of Athletic, Base-Ball, Cricket and other out-door Clubs will kindly mail their contributions not later than Monday in each week.

steadily to overtake her, and trying to pass Harvard. Still Columbia stuck fast to the front. Now the Wesleyans showed their stamina and challenged the Columbia. The last three-quarters of a mile exhibited a noble struggle between the Columbia, Wesleyan, Harvard and Dartmouth. Within a half mile of the finish, Columbia was going as steadily as ever, leading by a length and a half, Harvard nearer home than the Wesleyan by two lengths, Williams fourth, Dartmouth next, the remainder behind and Yale disabled, working slowly. Then something seemed wrong with the Wesleyans, for they slackened imperceptibly, but for an instant; then they made a grand rally, spurring famously, and now their boat drew on a level with Harvard, fighting lustily for second place, which she kept and won. Dartmouth then tried to pass Williams; but it was a close thing, both boats coming in so evenly that only to-day has it been decided that to Williams is awarded the fourth place.

The order of the finish was as follows:

Columbia.....	1	Cornell.....	6
Wesleyan.....	2	Trinity.....	7
Harvard.....	3	Princeton.....	8
Williams.....	4	Yale.....	withdrawn, disabled
Dartmouth.....	5		

The time, according to Commodore Brady, was:

Columbia.....	M. S.	Cornell.....	M. S.
Wesleyan.....	16 42½	Trinity.....	18 00
Harvard.....	16 50	Princeton.....	18 23
Dartmouth.....	16 54	Yale.....	18 38
Williams.....	17 08½		
	17 31		

It was just beyond the two mile stake that the trouble arose between Yale and Harvard. The gallant crew of the Columbia were clear of the flurry—pulling superbly. Yale was creeping on Harvard, when the oars clashed, and Yale, with broken oar and dismantled rudder, was hurt beyond recovery. Claims of a foul made at the close of the race by Yale were not allowed.

—The victorious Columbia arrived safely in this city on the afternoon of July 21st. The scene around the Grand Central Depot was beyond description. President Barnard, of Columbia College, received his boys in a most happy speech, and warmly congratulated the victors.

CHRISTIANA REGATTA AT WILMINGTON, DEL.—From our own correspondent "Seulls," we have a full report of the Christiana Navy Regatta, at Wilmington, Delaware, on the 18th July. The attendance 6,000 people, and the conditions of wind and weather favorable. We have space only for a summary.

SINGLE SCULL RACE—two miles, one turn.

F. S. Pleasanton, Quaker City Club, Philadelphia.....	1
C. E. Steel, Crescent Club, of Philadelphia.....	2

Time—17:19½.

This was Mr. Pleasanton's first successful race.

If he improves as much during the next as in the past year, he will make "work" for the best scullers of Philadelphia.

SIX-OARED BARGE RACE—3 miles, one turn.

Undine.....	Falcon.....	M. S.	20
Pioneer.....	Thistle.....	25	13½
Crew of Falcon.....			
E. H. Heald.....	stroke	Alex. Smith.....	stroke
F. L. Holmes.....	2	James H. Cameron.....	2
H. Lewis.....	3	George W. Turner.....	3
Paul Brown.....	4	Joseph S. Richardson.....	4
Joseph McMillan.....	5	E. Hagany.....	5
Joseph L. Jackson.....	6	William Bush.....	6
H. T. Gause.....	Cox'n	W. W. Smith.....	Cox'n

FOUR-OARED GIG RACE—3½ miles, one turn.

Bachelor.....	Idalia.....	23	10½
Pioneer.....	Hornet.....	23	30½
Undine.....	White Cap.....	24	52
Crew of White Cap.....

—Last week, at Philadelphia, the friends of Commodore Ferguson of the Schuylkill Navy, presented him with a gold badge valued at \$200, of elaborate and appropriate design. The ceremony took place at the Commodore's residence. Among those who participated were Messrs. J. C. Culin, John Hackley, Jr., Vice Commodore W. R. Tucker, W. A. Steel, C. E. Steel, J. C. Pinkerton, Joseph Muhr, J. Bedichmier, Frank Murphy, J. Gillingham, Samuel Goomley, S. C. Collins, James J. Chamber of the Press.

—The Grand Haven and Spring Lake Rowing Association of Michigan will hold their regatta on Grand River and Spring Lake on Wednesday and Thursday, the 12th and 13th of August. There will be double and single scull races, etc., and a grand review. Grand River is a straight away mile course, and Spring Lake is a deep, still lake offering a straight away two mile course. Address D. G. Cutler, Esq., Secretary, at Spring Lake, Michigan.

—The Washington *Sunday Herald* says that the Annapolis and Potomac Clubs are to have a series of races, four-oared shell and six-oared gig, to take place before the clubs leave for Saratoga to participate in the regatta to be held there the latter part of August.

—George Brown's new boat, the James Pryor, has been sold to a party in Boston. He keeps the "John Cooney," which he used in his last race with Scharff.

THE COLLEGE FOOT RACES.—The College foot races came off July 20th at Glen Mitchell. A large concourse of people was present. The one mile running race was won by E. Copeland of Cornell, in 4m. 58½s. The second prize was won by J. H. Van Duventer of Princeton, in 5m. 12s.; the third by S. A. Reed of Columbia, in 5m. 14½s. The 100 yards running race was won by A. B. Neven of Yale, in 10½s; second, J. B. Potter of Cornell, in 10½s. The three mile running race was won by W. H. Downs of Wesleyan, in 18m. 17½s.; second, J. T. Goodwin of Columbia, in 18m. 44½s. The hurdle running race of 120 yards, hurdles 12 yards apart, 42 inches high, was won by C. Maxwell of Yale, in 20½s, beating A. Marquand of Princeton, by 3 feet; third man, A. L. Rives of Harvard, who finished about two feet in the rear of Marquand. The seven mile walking match was won by J. E. Eustis of Wesleyan, in 71 minutes; C. H. Hubbell of Williams, second, in 72m. 27½s.; E. Price of Columbia, third. The prizes were offered by Mr. James Gordon Bennett.

HAIL COLUMBIA—16:42 1-4.

—The Philadelphians have selected the following eleven to take part in the cricket tourney in Halifax, Nova Scotia, on August 18th:—C. A. Newhall, E. Hopkinson, B. L. Baird, J. M. Fox, R. Ashbridge, D. S. Newhall, F. E. Brewster, G. Ashbridge, and R. N. Caldwell, of the Young America, Philadelphia, Germantown, and Marion clubs of Philadelphia. The substitutes include H. Magee, R. W. Clay, J. P. Newbold, and W. Welsh, Jr. The Halifax and Garrison clubs, of Halifax, the Toronto club, and other Canadian clubs will take part in the matches.

—The Bostons and Fall Rivers played cricket at East Cambridge last Saturday—Fall River, 156; Boston, 96.

—The first eleven of the Manhattan and Staten Island clubs will play a match on Thursday, 23d instant, at Staten Island. The return game with the Prospect Park club will take place in August, as the Manhattans close up September 15th. This is the only game the Prospect Park club will play this season.

—A remarkably close game was played in Chicago July 18th, as the appended score shows:—

Chicago.....	0	0	0	2	0	0	0	0	1—3
Philadelphia.....	0	0	1	0	0	0	0	0	0—1

—The College championship question has been settled by the signal success of Yale over the champion Princetons of 1873, and what is more in the eyes of Yale, over their rivals of Harvard. This is the only consolation Yale has for her defeat on the lake at Saratoga. The base ball matches at Glen Mitchell were settled on July 14th and 15th, the Yales winning the first game by 4 to 0, and the second by 7 to 4. Bentley came out of the fight with a broken nose, which was healed with the balm of victory.

—A remarkably fine game was played on the Staten Island club grounds July 16th between the Island nine and the Confidence club team of New Rochelle, a nine in which Kessler of the Atlantics played, Swandell of the Mutuels, and Shevlen of the Flyaways. The question is, What constitutes an amateur nine in Mr. Dillon's opinion? The score was 8 to 4 in favor of the New Rochelle nine.

—The old Atlantic base ball club of Jamaica played a game on Saturday afternoon with the Allegheny club of New York. Eleven innings were played, the score being 30 to 28 in favor of the Atlantics. Time of game, three hours and a half. The game was very closely contested throughout.

—The Nameless club were badly defeated by the Staten Island nine on July 18th by 24 to 9.

—The Chelsea and Montague clubs have both forfeited games recently by declining to finish games where they saw nothing but defeat in store for them.

—The New York Flyaways defeated the Atlantics of Hoboken and the Stars of New York last week by scores of 18 to 12 and 34 to 4.

—The Montagues were badly whipped at Prospect Park on Friday by the Amity nine, 18 to 6.

—The Athletics forfeited a game to the Hartfords July 14th by failing to meet their engagement. The rules say:—"Should one of two clubs fail to meet a regular engagement to play, mutually agreed upon, except on account of the death or severe illness of one or more of its regular players, or on account of stormy weather, the club failing to play shall forfeit the game." This is what the Athletic did with the Hartfords.

—The amateur Franklins of Chicago defeated the Blue Stockings at that city July 16th by 15 to 7.

—There was a base ball game July 17th at Saratoga in which the Harvard nine—one man a substitute—was beaten by a picked nine from other college clubs by a score of 19 to 14.

—The Quicksteps, the champions of Central Park, defeated the Eckfords at the Park on Saturday by a score of 21 to 8.

—The record of the professional championship contests since our last issue is as follows:—

July 13—Boston vs. Athletic at Boston.....	7 to 6
July 13—Atlantic vs. Hartford at Hartford.....	6 to 2
July 13—Chicago vs. Baltimore at Chicago.....	13 to 6
July 14—Boston vs. Mutual at Brooklyn.....	9 to 8
July 15—Athletic vs. Boston at Philadelphia.....	6 to 4
July 15—Chicago vs. Philadelphia at Chicago.....	10 to 3
July 15—Mutual vs. Atlantic at Brooklyn.....	5 to 2
July 18—Chicago vs. Philadelphia at Chicago.....	3 to 1
July 18—Mutual vs. Atlantic at Brooklyn.....	10 to 1

—The following is the full score of the first Harvard and Yale match at Saratoga, played July 14th, it being the model amateur game of the season, thus far, in which college nines have taken part:—

HARVARD.						YALE.					
Leeds, s. s.....	1	0	2	7	0	Hotchkiss, r. f.....	2	1	2	0	0
Hodges, 2d b.....	0	0	2	1	0	Nevens, 3d b.....	1	1	2	1	1
Tyler, c. f.....	1	0	3	0	0	Bentley, c.....	2	0	2	5	1
Thatcher, c.....	0	0	2	0	1	Avery, p.....	1	1	2	4	0
Kent, 1st b.....	0	0	9	0	0	Bigelow, 1st b.....	1	0	13	0	1
Tyng, 3d b.....	0	0	3	2	3	Osborn, s. s.....	2	0	1	1	1

SCORE BY INNINGS.

	1st.	2d.	3d.	4th.	5th.	6th.	7th.	8th.	9th.	Total
Harvard.....	0	0	0	0	0	0	0	0	0	0
Yale.....	2	0	0	1	0	1	0	0	0	4

Umpire.—Mr. Williamson, of Princeton College Club. Runs earned—Yale, 1. Passed balls—Thatcher, 1; Bentley, 0. Time of game, 1:50.

—The record of games played to July 20th by the championship nines is as follows:—

Club.	Games Won.	Lost.	Total.
Boston.....	30	8	38
Athletic.....	23	11	34
Mutual.....	18	16	34
Philadelphia.....	13	17	30
Chicago.....	14	16	30
Hartford.....	9	14	23
Atlantic.....	9	17	26
Baltimore.....	5	22	27
Total.....	121	121	242

Chicago has now won fourth position, Philadelphia being fifth.

—Large numbers of people gathered at the steamer's wharf in Philadelphia last week to witness the departure

of the base ball players for Europe—those gentlemen who go out as exponents and teachers of the American national game. Every available spot was occupied, and the good steamer Ohio departed amid tumultuous cheers and resounding good wishes. The departure of these clubs—the Boston and Athletic—has created a void in the championship arena, there being only six clubs now left to carry on the war. Of these, the Hartford, Atlantic and Baltimore clubs are considerably in arrears in regard to playing their quotas of five games with every other club, something all have to do in order to save their games from being forfeited; whereas the Bostons and Athletics have but a few games to play to make up their quotas of five games with each club, though the former will have thirty-two games to play, and the Athletics thirty-six, to complete their ten games each which they are required to play to close their series. Lately Chicago has pulled up to fourth position, and if the Mutuels do not look out sharp the Whites will replace them in third position.

—The printers connected with the establishment of Wynkoop & Hallenbeck, representing the Monitor and Wild Oats base ball clubs, met at Prospect Park on Saturday last. The Wild Oats won by a score of 40 to 7.

—The Third National Chess Congress ended July 16th in Chicago. A constitution, by-laws, and rules of play were adopted, and the following officers elected:—President, J. Congden, of Pennsylvania; Vice Presidents, W. W. Curran, of Illinois, and D. M. Martin, of Texas; Secretary, J. Roberts, of Pennsylvania; Treasurer, J. G. Whiteman, of Pennsylvania. The prizes of the tournament were awarded to the following gentlemen:—First prize of \$225 to Captain G. H. Mackenzie, of New York. Second prize of \$150 to Mr. H. Hosmer, of the Chicago chess club. Third prize of \$75 to Mr. Max Judd, of St. Louis. The score of the tournament was as follows:—Captain Mackenzie won eight and a half games, H. Hosmer won eight games, Max Judd won seven, F. Boek won four, J. A. Congden won one and a half games, and E. Perrin won one game. The association will hold its next national congress in Philadelphia during the centennial, in July, 1876.

—A female pedestrian in England, it is said, has challenged the wonderful performances of a Barclay or a Donahue by having accomplished her 1,000 mile walk in 1,000 hours. The woman, it is said, did it for glory and £50.

—Mullen will, in all probability, fail to accomplish the pedestrian feat of walking 500 miles in 144 hours.

New Publications.

LA VIE SPORTIVE EN 1874. LE TIR AU PISTOLET. Henri Vallee. Gastinne Renette, 39 Avenue d'Anton. Paris.

Adaptiveness as to names and words rather than as to manners and customs, is a characteristic of our gallant French friends, hence the title of the book "La Vie Sportive," in which Mr. Henri Vallee tells us with peculiar grace what he knows about pistol shooting in France. Commencing with the history of the arm, the author derives its name from Pistoja, in Italy, where a pretty little pond was made—a diminutive *misericorde*, perhaps—hence small daggers were called *pistoyers* and *pistolse*. When, in the middle of the fifteenth century, smaller fire-arms came into use, such arms were dubbed *pistolettas*. Early in the eighteenth century Lazarino Camminazzo and Kuchonreuter were the great makers of pistols. A curious expression of Montaigne's is found in regard to fire-arms when he says: "Fire-arms are so little effective, that if it was not for the noise they made they would soon get out of use." In speaking of the various nationalities distinguished for their address with the pistol, Mr. Vallee gives to Americans the palm for shooting with the pistol at the word, though Frenchmen are the best at an aiming shot. Perhaps the cleverest of all aimed pistol shots at present in France is the Prince Paul de Georgie, or two Russians, one having the curious name of Philosophow, following close to the Prince. Pistol galleries abound in France, and there is one in Paris called Le Tir Gastinne Renette, much frequented by Americans.

Some of the freaks of great pistol shots are told. It is said that General Junot, at the time of the Empire, amused himself with trying to flick off the top-knot in his cook's bonnet, but unfortunately the cook changed his position and poor cookey was killed. In speaking of the pistol as an arm for cavalry, Mr. Vallee says: "Why are not our cavalry and artillery regiments drilled to the pistol? Why should not cavalry officers make a special business of it? There is something disgusting in the idea of your being poked at ten feet off by the spear of an Uhlan, and not to know how you can put a ball through his brain." A curious portion of the book is devoted to the toilette necessary for those idiots who go in the field of honor. Costumes are of two characters. When a duel is to be fought with the sword a stiff starched shirt is in order, and a fancy dress is preferable; but when pistols are used, the habiliments must be clerical; black from head to foot. There is a funny story in the book about two gentlemen who went out into the field determined to take one another's lives. Sainte Beuve was one of the bloodthirsty ones. It was raining, and do what the seconds would Sainte Beuve insisted on raising his trusty umbrella. "I should not mind at all being killed," he said; "that is what I came here for; but I am determined not to catch a cold in my head."

"Le Tir au Pistolet" is an amusing book, gracefully written, and since there is a revival in pistol shooting in the United States, Mr. Vallee's book will doubtless be appreciated by many of our readers.

BOTANY CONDENSED. By Joseph A. Sewall, M. D., Prof. of Natural Sciences in Illinois State Normal University. Chicago: George Sherwood & Co.

This is a work designed for a text book for common schools, high schools and academies. While we have examined and used many much higher priced works on this subject than the one before us, we feel this to be the best adapted to fill that want. Although it is an elementary work, it is not designed for the primary schools, but to meet the wants of our boys and girls in the higher classes as well. The illustrations are all from the plants of the field, and as a work for the young or old student of this interesting and necessary study, will be found a great aid in its pursuit. The glossary will be found of much value to the older, and more progressive classes. The fine, even elegant, series of correct botanical drawings in Prof. Sewall's work are of themselves alone the most valuable of the kind we have recently had the pleasure to examine.

UNDER THE TREES. By Rev. Samuel Prime. New York: Harper & Bros.

This is not only a very readable book, but one that brings the freshness of the out-door world to our immediate senses. The author has been there, and we have only to read his works to know that he is one of the devout worshippers within God's great cathedral temples of the shady wildwood. He sermonizes like an educated, practical naturalist; he makes a direct heart-appeal to the sympathies of every lover of nature. The whole out-door world is before him, and as we listen to his talk about birds, dogs, fishing, science, agriculture and other interesting matters, we follow him as our mentor willingly, and never weary of his pleasant conversations. We have only to recommend this last work to the candid perusal of all who have been so fortunate as to have read that capital book of a few months since—"I Go a Fishing." This work receives the cordial endorsement of the FOREST AND STREAM as deserving a prominent place in every sportsman's library.

The Horse and Course.

—The third day (July 16th) of the Monmouth Park races was a great success, attendance large and fashionable, and track in fine condition, improved greatly by a refreshing shower, which fell previous to the first race. The Thespian Stakes—a dash of three quarters of a mile by two year olds—was the first race. Eight horses came to the post, and seven ran. Sweet Lips won an interesting race, beating Aristides, who was second, and Aniella third. The West End stakes had but three starters out of twenty-six nominations. The distance was one mile and three quarters. Bonaventure won the race, and Bannerette made a dead heat with Regardless for second place. The two mile heat race had four starters. These were Vandalite, Fellowcraft, Stockwood, and Donnybrook. Vandalite was the favorite, Fellowcraft the second choice, and Donnybrook the third. Vandalite won a capital race in two straight heats, the second being very fast, the last mile being run in 1:46½. Fellowcraft ran second, Stockwood third. The fourth race was a dash of a mile and three quarters, for the Long Branch Stakes. The conditions were for all ages, to carry 100 pounds. There were twenty-one nominations, but only four starters. These were Woodbine, Survivor, Resolute, and Cariboo. Woodbine won the race, Survivor second. The contest between these two was very fine up the homestretch; but the mare outlived the colt, and beat him cleverly.

The second meeting of the Monmouth Park Association closed at Long Branch on July 18th. Five thousand persons witnessed the sport. The first contest was for the August stakes, for which were entered Chesapeake, Sweet Lips, Vernango, Lizzie R., Aniella, Silvius, and Victorious. Chesapeake won the race, Lizzie R. second, Sweet Lips third. Time—1:47½.

In the Robbins Stakes, Acrobat was first, Aaron Pennington second, Macroon third, Bannerette fourth. Time—two miles—3:42.

The Consolation Handicap, for beaten horses, mile and a half, was won by Stockwood, J. L. Carver second, Cariboo third. Time—2:42½.

The match race between Vaultress and Shylock, two miles, was won by the latter. Time—3:46½.

In the steeplechase handicap for all ages, three miles, over a fair hunting course, George West was first, Henrietta second, Wizard third, Vesuvius and Impecunious out. Time—8:05½.

—The East Saginaw (Michigan) Driving Park Association held a race on their grounds on July 16th for a special purse of \$5,000, divided as follows—\$2,500 to the first, \$1,500 to the second, and \$1,000 to the horse which beat the fastest time on record. Goldsmith Maid won three straight heats in 2:19½, 2:16½, and 2:16, the only contestant being Judge Fullerton. Judge Fullerton was beaten one length in the first heat, two lengths in the second heat, and four lengths in the third. Fullerton was driven by Dan Mace, and the Maid by Budd Doble.

Fullerton's time at Saratoga, July 18th, was 2:20½, 2:18, and 2:18½. The track was in splendid condition; it is one mile and three feet in length. Eight thousand people were present. Judge Fullerton was raised in Orange county, New York, and was known as the Bull colt sired by Mr. Robert Bonner's famous stallion Edward Everett. Fullerton was unknown until he reached his fifth year.

—The Carleton Park races came off at Toronto, Ontario, Dominion of Canada, on July 17th. On the second day the first event was a steeple chase, \$275 handicap; two and three quarter miles, and was won by Jack the Barber. Race for \$200, mile dash, open to all; won by Trouble in 1:54. Dominion race, \$250 handicap, mile heats; won by Swallow; best time, 1:56½. Hotel Keepers' Purse of \$300, open to all, mile and a half dash; won by War cry.

Orange Sporting Powder.

ORANGE LIGHTNING POWDER,
The strongest and cleanest Powder made. Nos. 1
to 7, packed only in sealed 1 lb. canisters. The coarser
sizes especially are recommended to owners of fine
breech loading guns, giving great penetration with
very slight recoil.

ORANGE DUCKING POWDER,
For water fowl. Very strong and clean. Nos. 1 to
5. Packed in metal kegs of 6 1/2 lbs. each, and in canis-
ters of 1 and 5 lbs.

AUDUBON POWDER,
Very quick. For woodcock and quail Nos. 1 to 4.
Packed in metal kegs of 12 1/2 lbs. and 6 1/2 lbs., and in
pound canisters.

ORANGE RIFLE POWDER,
The best for rifles and for all ordinary purposes.
Sizes F.G., F.F.G., the last being the finest and
most used. Packed in wood and metal kegs of 25
lbs., 12 1/2 lbs., and 6 1/2 lbs., and in canisters of 1 lb. and
1/2 pound.

All of the above give high velocities and less resid-
uum than any other brands made.

WHAT SPLENDID NEW FIELD GAME WHICH
I created such an excitement at Newport, Long
Branch and elsewhere last season, will be brought out
this spring, in sets, of eight different styles, at fol-
lowing prices: \$8; \$12 50; \$25; \$50; \$100; \$250; \$500;
\$1,000. As this beautiful game cannot be described
in a brief space, we will send an illustrated catalogue
containing rules and full description, free to any one
on application.

WEST & LEE GAME CO., Worcester, Mass.

VIENNA, AUSTRIA, Nov. 30, 1873.

Messrs. Wm. S. Kimball & Co.:

Sirs—A friend of mine sent me, with a transport
of Indian Skulls, two pounds "Vanity Fair," which I declare
to be the best tobacco I ever smoked. We have very good
tobacco in Vienna—Turkish and Hungarian, but "Vanity Fair"
is the King of all, by its aromatic flavor and the right sort of
strength. My friend in New York got an appointment in
California, by that reason I apply immediately to you, begging
you to send me for the enclosed ten dollars, a supply of "Vanity
Fair," and send with the next steamer to Germany. If there
is a German firm that sells your excellent "Vanity Fair," I
beg you to enclose me the address.

PATENT AUTOMATIC MUZZLE.

[From N. Y. Times, June 22.]

"Mr. Bergh has a
muzzle that he recom-
mends, as it does not
FRET OR WORRY the
dog when on his head.

By a spring the dog
can open his mouth to
the fullest extent, and
running out his tongue
pant with as much ease
as though he was not
muzzled, and drunk
without any difficulty,
but it is impossible for

him to bite." The most humane invention of the age.

DECARBONIZED STEEL BARREL.

We are now prepared to furnish these Guns, 28 and 30 inches, No. 12 gauge, at \$45. Discounts to the trade only. Will have Twist and Laminated Barrels at \$60 and \$75 about July 1st, 1874.

Hegeman's Patent Portable Folding Boat.

For use as LIFE-BOATS, LIGHTERS, Dingies, Dorys, on board Steamers, Yachts and other Vessels. Also for Sportsmen, Tourists, Trappers, Exploring Expeditions, Parties Camp Out, &c. &c.

These safe and perfectly portable boats will admit of the roughest usage. A very light, strong and durable frame of ash or other tough wood, with canvas cover, and can be folded in one-eighth space, for transportation, and carried in a light buggy wagon, on horse back, or by single person, and can be unfolded ready for use, in three minute's time. Boats neatly foded, packed and shipped by express anywhere at same rate of freight as ordinary goods.

JOHN HEGEMAN, Ballston Spa, Saratoga Co., N. Y.

This arm was submitted in competition with over one hundred different systems, American and European, to the Board of United States Officers, appointed by Act of Congress, 6th June, 1872, for the purpose of selecting the best arm for the service, and of which Brig. Gen. A. H. Terry was President. It successfully passed through all the tests.

The following is the report of the Board:
"Resolved, That the adoption of magazine guns for the military service by all nations is only a question of time; that whenever an arm shall be devised which shall be as effective as a single breech-loader, as the best of the existing breech-loading arms, and shall at the same time possess a safe and easily manipulated magazine, every consideration of public policy will require its adoption."

Resolved, further, That the experiments before the Board with the Ward-Burton Magazine System have so impressed the Board with the merits of this gun, that they consider it as more nearly fulfilling the conditions above specified than any other tried by them or of which they have any knowledge, and it does recommend that a number of magazine muskets be made on the plan for further trial in the field." (See Ordnance Report.)

We are now receiving orders for these guns, and due notice will be given in this paper when they are ready for delivery.

The following is our scale of prices: Special Magazine for large game, carrying from 3 to 8 cartridges, 70 to 85 grs. of powder, 350 to 400 grs. of lead, 8 to 10 lbs. weight, from \$60 and upwards, according to finish. Special Long-range Magazine Rifle for Creedmoor shooting, 90 grs. of powder, 480 grs. of lead, carrying 3 to 8 cartridges, weighing 10 lbs., from \$100 and upward. Magazine guns for general use, carrying 3 to 9 cartridges, 60 grs. powder, 350 grs. lead, from \$40 and upward. Single Breech-Loader, Creedmoor shooting, for long range, 90 grs. powder; 480 grs. lead, from \$60 and upward. Single Breech-Loader for general use, 6 to 7 lbs., 60 grs. powder, 350 grs. lead, from \$30 and upward. The calibre of all our rifles, unless otherwise ordered, will be 45-100 in. All communications should be addressed to

Kentucky Public Library

WERE DRAWN AS FOLLOWS:

The first prize of \$187,500, the capital prize, by clubs in Memphis, Tenn.

The second gift, \$75,000, was paid to State Bank, Madison, Mo., J. H. Wakefield and A. L. Sims, of Trenton, Ky., H. H. Bollinger, Pembroke, Ky., P. W. Dooner, Los Angeles, Cal., W. G. Byerly, Portsmouth, O., Flint & Chamberlain, Waco, Texas, and others, the tickets having been sold in coupons.

The Farmers' National Bank, of Richmond, Ky., drew the half of the third prize, \$37,500. Wm. E. Oates, Vicksburg, Miss., J. M. Copeland, Franklin, Ky., Armstrong & Sawyer, Gransburg, Ind., each one-tenth. The remainder was held in clubs.

The first prize in the third drawing was all in one ticket, and owned by L. H. Keith, Esq., Kingston, Mass., to whom was paid \$100,000 in cash.

The Fifth Gift Concert,

which is positively the LAST THAT WILL EVER BE GIVEN UNDER THIS CHARTER, will come off in Public Library Hall, at Louisville, Ky.

FRIDAY, JULY 31, 1874.

\$2,500,000

divided into twenty thousand gifts, will be distributed among the ticket-holders.

W. W. GREENER'S
PATENT TREBLE WEDGE
Fast Breech Loader

Indestructible by Gunpowder.

This gun is specially designed to meet the requirements of American sportsmen. It will stand a larger charge of powder, and shoot stronger than any other system. For duck and pigeon shooting these guns stand unrivalled. The action is simple in construction, quick and easy to load. They may be inspected this season at all the principle gun stores in the United States. Prices moderate.

The second edition of "Modern Breech Loaders, Sporting and Military," will be shortly published by
W. W. GREENER,
July 2 St. Mary's Works, Birmingham, England.

THE COMMODORE'S
SIGNAL BOOK

AND

VADE MECUM,

CONTAINING

Chromo Chart

OF ATLANTIC, PACIFIC AND COAST STEAM-SHIP FLAGS, FUNNELS AND NIGHT SIGNALS; CHARTS OF ALL THE UNITED STATES YACHT CLUB FLAGS; PRIVATE SIGNALS OF YACHTS; LISTS OF OFFICERS OF YACHT CLUBS FOR 1874; NAMES OF YACHTS; OWNERS; RIG; DIMENSIONS; PILOT BOATS; REGATTA DAYS; LIFE SAVING STATIONS; TIDE TABLES, &c., &c.

Compiled from official sources, by

THOMAS MANNING,

138 Fulton Street, N. Y.

And published under the auspices of the Cnard Steam Ship Co. and Brooklyn Yacht Club.

The Compiler has the honor to announce to professional Mariners and Yachtsmen that the above is now in press, and will shortly be published. Price \$2 50. The Life Saving Stations include the new districts. The Tide Tables will be very extensive.

The Compilation has been carefully made, and is complete and accurate.

The artistic and typographical work will be in the best style.

Subscribers remitting the price of the work, with name and address, either to the Compiler, to John Filmer, 292 Broadway, or to FOREST AND STREAM Publishing Co., New York, will have a copy forwarded as soon as published, mailed free. jly2

SHARPS'
Breech-Loading, Metallic Cartridge,
Military,
Hunting,
and Target
RIFLES.
EXCELS ALL OTHERS
—IN—
Accuracy, Strength & Safety
No Premature Discharges Ever Occur.

Special attention is called to their LONG RANGE RIFLE, weighing 10 lbs., for target practice. This rifle won the AMATEUR CLUB MEDAL, at Creedmoor Range, New York, three times, making eighty-one points out of a possible eighty-four—best record ever made on the Range. At same Range, Fall meeting, in "All Corners Match" 500 and 600 yards, 75 entries and 10 prizes, the SHARPS' RIFLES took five prizes with seven guns. At the Opening Meeting, Creedmoor, June 6 1874, Sharps' took four out of six prizes in the match for military rifles at 500 yards; the first and second prizes being won with it by scores of 27 out of a possible 28.

Every Rifle Warranted a good shooter;
Calibres 40, 44 and 50-100 in., of any length desired;
Charge of powder, 50 to 100 grains;
Weight of balls, 220 to 540 grains;
Stocks, plain, also pistol grip and checked;
Sights, plain, globe and peep, Vernier with interchangeable front sight and wind gauge.

Price, from \$35 00 to \$125 00.

Every variety of ammunition for above guns constantly on hand. Send for circulars

THE EDITORIAL ALEMBIC.

BY CHAS. HALLOCK.

IN thermal climes, where man has nought to do
But fan himself and mope the long day through,
Where slaves assiduous mix the cooling ice,
And minister with zeal to each caprice;
Where hours, languid, woo with lustrous eyes,
And valets brush away persistent flies;
Where weekly papers vex not nor harass
The ransacked brains of editor or as-
sistant editor—

'Tis sweet to think on sublunary things,
And bless the gifts that such good fortune brings.
With all the chords of earth in sweet attune,
E'en life itself would seem almost a boon.

But to the man whom arduous cares oppress,
Preparing copy for exacting press,
Who day by day with perspiration reeks,
Through weary round of burning summer weeks—
Like alchemist, who from his realm of heat,
With fiery test and subtle art replete,
Forth from the deep alembic of the mind
Distills his wits to edify mankind—
To him, with feverish brain and debts unpaid,
(Thermometer full ninety in the shade,)
Existence seems almost a torrid zone,
And Tophet well may claim him as his own.

Sports in California.

No. IV.—WOODCRAFT CONTINUED.

IN my last I gave you a sketch of an Indian "scare" we had while fishing, together with an interpretation, at length, of the Indian "sign." Not wishing to be tedious, I will give but another example where the knowledge of "sign" enabled us to escape scot free, and then close up the personal repertoire.

On this occasion we were fishing a little stream running through a deep ravine, some six or eight miles to the northward of our Post. The afternoon was lovely, and our success had been excellent. Captain — and myself had gone up the stream a considerable distance beyond the remainder of the party, and had been diligently engaged in relieving a number of choice pools of their "oldest inhabitants." We were in a deeply shaded part of the ravine, and had been so busily employed that we had not spoken for half an hour, though not twenty yards apart the greater portion of the time.

Suddenly Captain —, who was an old Indian campaigner, came quietly to my side and said in a low voice, "Do you see that? It is time for us to leave. There are Indians about, and if we are not quick we will be cut off before we can reach the Post." While uttering these words he pointed up the glen. Looking in the direction indicated, I saw, about a hundred yards before us, one of those half-starved, yellow and white mongrel curs, half dog, half coyote, known as "Indian dogs," come stealing out of the bushes, with drooping ears and tail, and, perceiving we noticed him, as quietly slinking back again.

Perfectly comprehending the "sign," and knowing that no time was to be lost, I joined the gallant captain in a guarded though swift retreat. On our way down we met the party, and communicating the information all hurried to where we had secured our animals. Quite a brisk breeze was blowing down the ravine, and if we had needed any other assurance of the correctness of our conclusions the startled look and straining efforts of our mules to escape from their fastenings left no room for doubt. Quickly saddling and mounting, we galloped off. Giving little heed to the roughness of the trail, or paying much attention to the briars and thickets, we pushed on as rapidly as our willing animals could carry us, and in a very short time had put several miles between us and our late fishing ground.

At the mouth of the ravine, where the hills subsided into the level, and about a mile from the bay, was a thriving ranche. The well-tilled fields, abundant and sleek-looking stock, and neat buildings, told as well of the thrift of the settler as of the richness of the soil. As we turned into

this clearing the trail led into a cart track, which took us close to the settler's house. When we rode by he, with his wife and children, was sitting at the supper table. The noise of the clattering hoofs caused him to look up, nod a friendly good evening, and halloo a pleasant invitation to stop and sup. Riding to the window, I told him what was hurrying us off so much earlier than we had anticipated, and advised him to leave with his family and come with us. He, however, declined, saying that the Indians had never troubled him nor stolen his stock; that both he and his wife had always treated them kindly, and he guessed they would not molest him; that we must be wrong. At any rate he would risk it even if we were right. It is perfectly astonishing how reckless these settlers become. Long and continued fellowship with danger makes them utterly incredulous and careless until they will give no heed to anything save the actual presence of the enemy. This is one great cause of the facility and impunity with which the Indians commit so many ravages on our frontiers. Not an hour after we left the Indians came to this ranche and shot from a thicket, some fifty yards from the house, this very man as he sat on the porch smoking his pipe. The first notice he had of their presence was the flash and report of their rifles. We got to our Post without any trouble. As a matter of course, the Indians had left before any assistance reached the ranche.

And all this indicated by a mongrel cur seen in the woods. How was this "Indian sign?" Very simply thus: When the Indians go on the war path in small parties they never take dogs with them, but always drive them back. Yet the dogs will follow their masters, and may occasionally be seen fighting over the bones of their abandoned camps. They always keep out of sight of their masters, however, knowing that if seen they will be driven back; and the dogs well know that Indians are not famed for gentleness in their treatment of brutes. So they usually keep in the rear, or on the flanks of the party. In the above case the dog had evidently gotten ahead, owing to the nature of the country and lay of the land, and, being spied by the captain and myself, enabled us to get away in good time. As they generally follow their masters, when we saw the animal we much feared lest the Indians had already gotten between us and the Post, and cut us off.

These instances are very simple examples of the science of woodcraft—for a science, and a very perfect one, too, it undoubtedly is. Not written in ordinary books—for this is an art in which *experientia docet* is the motto—the pages of the great book of Nature alone contain the only information that can be acquired. And to interpret correctly these lessons requires the experience of many long years of trial and vicissitude. It is wonderful how acute the senses become when thus educated. The relations of cause and effect become almost intuitive. The faintest departure from Nature's laws attracts the attention. Not a leaf falls, or is turned the wrong way, or presents any unusual aspect; not a twig is broken or bent; not a blade of grass is crushed, but the attention is riveted and the cause understood and ascertained. And all this without effort—as I said, intuitively. One would think, to hear of all that is done, that the mind was on a continuous stretch. But this is not the case, unless in the neighborhood of the game or enemy. Without being especially attentive, the senses are—if I may be allowed the expression—ever on the alert, but, apparently, notice nothing unless it is unusual. Then they spring into action instantly. The acuteness of "mountain men," as they are styled, or hunters, and especially of Indians, in the interpretation of "sign" is absolutely astonishing and incredible. Looking at a trail they will tell you how many persons have passed along, whether whites, Indians, or negroes, male or female, fresh or tired, how long since they have passed, and, probably, their destination and intention. If the trail be that of animals, they will tell you whether these were ridden, loose or loaded, whether horses, mules, or horned cattle, whether tired or fresh, the gait at which they travelled, the tribe or country of the riders, etc., *ad infinitum*. Often an Indian will point out

the entire impression of a foot, calling it a broad trail when the uneducated eye will perceive nothing save, perhaps, a formless inequality of the ground. In fact, there seems almost to be no limit to the accuracy which they attain.

Those interested in the subject will find some very instructive accounts and descriptions of these matters in Marcy's "Prairie Traveller," and "Army Life on the Border," in Galton's "Art of Travel," and in Lord and Baines' "Shifts and Expedients." [And, even more particularly, in "Ruxton's Life in the Far West.—Ed.]

Some time ago I saw a little book on South America, in which were mentioned some most astonishing instances of perfection in this art. It appears that among the Gauchos of the South American pampas, and the Llaneros of Venezuela, there is a class of men known as "rastraedores," or trailers, who are so skilled in this science that they are frequently employed by the authorities for the discovery of escaped convicts or prisoners.

On one occasion the narrator saw an old man walking slowly along the road and peering intently on the ground. Supposing he had lost something for which he was searching, and desiring to render assistance, if possible, for the man seemed very old, he accosted him. The man replied that there were some thieves about, "for," said he, "there was a man who was dressed in women's clothes, and wore women's shoes which did not fit him, who passed here, and as he was disguised, he must be intent on some evil purpose." He added, "I think he has gone to the next town." And sure enough, a few days afterwards came the news that some thieves had been discovered in that town who were dressed in female apparel.

In another case, one of these men, while absent from home on business, had his house robbed, and, among other things, a saddle stolen. His wife, coming into the house shortly after, noticed the track of the thief in the sand, and placed a bowl over it. Some months later, when her husband returned, she showed him the footprint. Time passed on, and two years afterward, in passing along a street in the suburbs of the town, the rastreador noticed a footprint, and following it up, entered a house and there found his saddle. He had recognized the trail of the robber.

The same man, who was the most celebrated rastreador in the province, was once employed by the government to ascertain the whereabouts of a prisoner under sentence of death, who had eluded the vigilance of the officers and escaped from gaol. The fugitive had resorted to every device and artifice to destroy his trail that fear of death could inspire, for he knew he would be followed, and, if captured, executed. He even took to the river and swam down the stream for a long distance. Patiently the rastreador followed every winding and doubling of the trail. When he came to the river he knew that as the man went in he must come out again. So he carefully went along the banks, and after a time said, "He came out here." Following the trail, he came to a vineyard, surrounded by a stone wall, and carefully walked around it. "He is in there," said he to the officer in charge of the party which accompanied him. A thorough search ensued. At length, tired of hunting, they returned, and the officer said, "He has escaped." "He is still there," replied the rastreador. Another and more thorough search was made, and the prisoner was discovered concealed among a mass of vines and rubbish. He was executed the next morning.

All of these cases are said to be well authenticated, and not mere "travellers' tales." Many others might be cited, but this article is already too long, and I fear lest I weary the reader. Enough has, however, been said to show that, whether in the forest or on the plain, the art is the same and that, as Frank Forester said, "some pleasure and much profit may be gained from the cultivation of the gentle science of woodcraft."

MONMOUTH.

—Hogarth's picture of Calais gate is for sale in England. It is remarkable in an ichthyological way, because an old woman is handling a hake, and the satirist of the age has repeated the face of the woman in that of the fish, so that the old woman and the hake look like sisters.

For Forest and Stream.

FLORIDA AS A SPORTSMAN'S RESORT.

IT gave me much satisfaction and entertainment to read the letter upon Fort Capron in a recent issue of your paper. I agree with the writer in every particular as to the fitness of the place for a hotel, as to the abundance of game and fish, and I mentioned in one of my letters to your journal that a gentleman contemplated erecting just such a house as the hunter upon Indian River needed and found not. The crying want of that lagoon is a good hotel. In its whole one hundred and forty miles length, there is not an establishment, (if we except Titus' at Sand Point,) worthy the name of hotel. The site of the hotel referred to was at Taylor's Creek, about two miles below the site of old Fort Capron. In many respects this is a better place than at Capron, as the land is higher, the creek banks being nearly fifty feet high, and the waters of the creek give a never-ending supply of fish. Whether the purpose of the projector of the enterprise is likely to be carried out, I cannot tell, as no information has reached me since my departure.

Regarding the abundance of deer and turkeys, no doubt things have changed since the troops were there. The Indians have hunted the pine barrens back of the river for several years past and have pretty effectually exterminated them. However, if one will hunt warily and keep both eyes open, he may discover a few between the Fort and Seven-Mile-Hole. The old Russel plantation, the site of the Fort, is now gone to decay. The beautiful oleander hedge is broken down, clumps of Cherokee rose straggle over the ground in wild luxuriance; guavas and limes, lemons and oranges are rapidly being choked out with the wild growth, and nature is rapidly assuming sway over the old parade ground and gardens.

The only indication of the occupation by troops is a heap of bricks, said to have been the bake oven. One of the best results of my letters is the occasional waking up of some one of the many veterans of the Indian war. It rejoices me to see that they are coming forth and telling us what we long have wished to know about Florida as it was during the war and prior to the late difficulty. It is amusing, the manner in which these old soldiers, who have been through such difficult undertakings, treat our comparatively tame exploits of the present day.

Referring to the exploration of Lake Okeechobee, they say, "Oh, yes! that was very good; extremely well done—for a boy; but then, we were there years ago." They will persist in affirming that I stated that the lake was unexplored. Now, if they will refer to the number of FOREST AND STREAM containing my report, they will see that I said the lake had been visited at least twice during the first war, and a post established near the northern shore during the second; and I presumed the northern shore had been pretty thoroughly explored. I cannot recall my exact words, but that was their meaning. I think I spoke of this in my article, in a November number, upon my attempt of a previous year to reach the lake.

Since my return I have received a communication from an old army officer who was stationed at Fort Centre, on Fish-eating Creek, describing the route via the Carlosahatchee. He says: "The difficulties in reaching the lake by this route would be very great to private parties, but it may be doubted if they would exceed those so gallantly overcome by Fred Beverly on the Kissimmee route."

That is all very well. I like those honeyed words, and they "makes me feel good," but I fancy I can detect a sly twinkle in the eye as they administer such a bolus, and a half-smothered chuckle, as they reflect upon what they have endured while hunting Indians, in swamps I would not dare to penetrate. Nothing would be more to my liking than to take these old veterans by the hand and hear the story of their adventures from their own lips. They have given us a shot now and then and the occasional glimpses have been attractive. Let them come out from behind their intrenchments and deliver a whole broadside.

FRED. BEVERLY.

NOTES ON TEXAS.

GALVESTON, July 10, 1874.

EDITOR FOREST AND STREAM:—

Within the last few weeks trout and red fish have been extremely scarce in and around our city point, and only within a short time since, while on an excursion up the bay, was the writer enabled to account for it. On the western shore the grass grows in the water some three feet in height inside a long reef; the water there maintains a depth of two feet always, and it is now the breeding grounds for the entire finny tribe. While shoving a skiff gently through this immense forest of grass one could see stingarees from the size of a silver dime up to five feet in diameter; likewise red fish from the tiniest, an inch long, up to four feet in length. Trout in vast quantities—all sizes; saw some that would measure twenty-six inches in length. The favorite mode of getting them is by using grains; an expert hand can grain twenty to thirty per day. I saw there in this bed of grass, which is perhaps 100 yards wide and twenty-five miles long, some very curious fish; among the curious were a toad fish with a horn on top of his head similar to a land horned frog. Another kind was a fish about four inches in length and two in width and an inch thick, no scales. The boys blow wind into its flat mouth, inflating it as large as the double fist, then throw it down into the bottom of the boat, making a loud report. We saw alligator gars, sword fish, sharks, young jew fish, croakers, innumerable young sheepshead, whiting, and trout, and last but not least, young alligators; caught some no longer than six inches in length. They probably floated down into this brackish water from some fresh water hole or inlet near by, as alligators generally select a fresh water pond, marsh, or creek to lay their eggs in, a large nest, among bullrushes ten or twelve feet high. I recollect a good many years ago when a boy, I was coming from a visit to a relative's farm on the bay; among my boy's traps were a couple of specimens of the above described young alligators in a not very secure box, and while on the steamer during the night the young brutes got out of the box, and one finding its way into the ladies' cabin crawled into the berth of a sleeping beauty; about twelve o'clock the passengers were startled by some first-class screaming, every one imagined the boat was on fire; men, women and children rushed about in all directions, all curiously adorned, among whom was the captain. Straightway proceeding to where those vehement sounds of "take it away" were

issued, there sat the beauty and my little brute fighting for the supremacy of the berth. The wind up of the affair was quickly terminated by the Captain throwing the cause of the alarm overboard, and all the passengers, and especially the ladies, quickly vanished into their state rooms, thinking how foolish they were to get so frightened, all on account of a young alligator. The cabin boys turned out next morning and found my other pet ruminating in the pantry; he also shared the same fate of his companion, much to my sorrow and regret, as my mind was fully bent on raising them in the garden in a quiet nook, all by themselves.

The Captain says to me, "Joe, don't bring any more such pets here," and after that always cast sly glances at my boyish luggage. Our fishermen are hauling their seines near the breeding grounds as near as can be got to the grass without going into it, and catch all the wayfarers to and from the breeding grounds. I see bunches of young red fish, some six inches in length, offered for sale, costing a quarter and as much as a small family wants for a meal. These fish in three or four months time, in our water, develop amazingly, and what breakers of lines they get to be by next spring! It is here where protective laws come in force. Much to many sportsmen's regret we have neither laws for fin nor feather in our State, except the laws of nature, and more, the laws of trade, but a demand is certainly forthcoming. Some feeble demonstrations have been made by parties trying to have them passed before our Texas Legislature, but I suppose their time has been too much engrossed by larger and more important (as they think,) considerations than to pay any attention to petitions. It is hoped that ere long those important points will be engrossed and that they will not overlook the sportsmen's document. Towards a little later our sheepshead return and thousands are caught about our wharves, nearly every party returning home after a fish in the evening of an hour with a hundred or so from six to nine inches in length. Since the departure of the fish the writer has been consoling himself with a catch of two or three times per week of Texas lobsters. Scientists say fish make brain. I think so myself; at any rate, after a good meal on the above-described fish, I am a first rate talker, and the business of the day is gone through with much easier and sooner and pleasanter than when beef is eaten. Latter is an article that we have abundantly cheap, and much more is eaten than I think good for the people; they eschew fish too much. We certainly want more brain, therefore more and cheaper fish. A very short time since a party of gentlemen took what might be called a little recreation from the cares of business; leaving our wharf just as one of the faintest streaks of daylight was coming—one bright and early morn—in a fast sailing yacht, a good breeze slightly leading, found us in seventy minutes just thirteen miles away from friends, care and home. Sailing into a little bayou, we securely fastened our little traveler, and out with our hand lines, with the nicest shrimp on some first class hooks. Not long ere the party caught sufficient for a breakfast, and by a quarter of seven we sat down to fried red fish, boiled Texas lobster, sliced ham, old Java, ice and milk, musk melon, Hamburg grapes, figs, bananas, seated beneath the wild mustang grapes hanging overhead within a few feet, a clean spread on a grassy carpet, inhaling some pure air and feeling like other men, each of the party exhilarated, and all said: "Texas fine." I noticed it was in the neighborhood of ten o'clock before we took our tackle and fished with indifferent success. The sun became scorching, and a very thin shirt and pair of drawers were comfortable, to retire under the tent and pass away the hours until dinner time. About four o'clock was cool enough to try again our luck with the fin, and with much success. Bleeding the trout and red fish alive, and packing down in ice, had a most delicious repast next morning. Coming back we hardly fared so well as going, having a dead beat, and the little waters rose in angry swells. To say we were wet is using it mildly—a little deluge; using a pump and bucket to keep her free. With a double reef we made five miles an hour to windward, and arrived safe.

More anon. Yours, truly,

J. L.

For Forest and Stream.

NOTES ON BLUE FISHING.

IT has been intimated that "Al Fresco" is in some way interested "in writing up Barnegat," but I can assure your readers that such is not the case. I own no land there, have no stock or interest in the railroads leading to that point, and have no friends there, except those whose acquaintance I have made on my fishing excursions. It was by a mere accident that I discovered this piscatorial resort, and I have enjoyed so much sport during my visits to B. that I deem it but just that the disciples of Old Isaac should be posted.

Fishing for blue fish entails the necessity of the fisherman unhooking his captures; for if the boat is of sufficient size to render the sport enjoyable, the boatman will have ample employment in managing the craft without usurping the duties and privileges of the piscator. The "animated chopping machines," (as they are appropriately termed by the authorities of the Smithsonian Institution,) are supplied with a dental outfit of utilitarian character, and due and proper care must be observed to keep fingers at a respectable distance from their dental developments, for they will lacerate a finger with greater celerity than the most accomplished surgeon.

Blue fishing is exciting sport, and when they are in a biting mood, the fisherman becomes careless of his unmentionables. If the novice intends engaging in it, we would recommend him to provide a worn-out suit of clothing to be abandoned at the end of the sport. I keep at Barnegat an outfit for fishing purposes, consisting of an old felt hat, brown flannel shirt, old vest, thick cassimere pants, and a pair of stout soldier's brogans. This utilitarian and attractive outfit is put on in the boat and changed before the landing is reached in the evening. Captain Joel Ridgway gave me an amusing description of the condition of the unmentionables of one of your celebrated Brooklyn pastors who visited Barnegat to prove or disprove the "fish stories" of "Al Fresco." He thought the picture was too highly colored, and that my statements should be received *cum grano salis*. Soon after leaving Barnegat Creek he became busily engaged landing large fish, and through excitement forgot that he wore a pair of black cloth pants, "for which he had paid \$80 but a few weeks before." After the expiration of an hour or two he found his fingers sore and bleeding, and stopped to survey damages; he took a look at his clerical unmentionables, and his surprise can

be imagined when he realized the fact that they were wet and covered with blood, slime and fish scales. A word of advice from the initiated would have enabled him to return home in a presentable condition.

When catching large fish, or when small fish bite rapidly, the thumb and first and second fingers of each hand are liable to suffer from the friction of the line; and we would advise the intending blue-fisher to provide himself with "India Rubber Finger Stalls." These can be purchased at any of the stores dealing in rubber goods, and at many drug stores. Price per dozen from \$1 to \$1.25 cents. The purchaser should select them of proper sizes to fit thumbs and fingers snugly; for if too tight they constrict and numb the fingers, and if too loose they cannot be kept in position. One of my piscatorial friends ridiculed the idea of wearing such "nonsensical things," but he became a convert to India rubber. Last September I introduced him to the attention of a school of large and hungry fish, averaging twelve pounds. At the end of one hour and a quarter we had landed sixty-eight, and he found himself *hors de combat*. On his return home he ornamented his thumbs and fingers with rags and healing ointment, and the ornamentation occupied a period of two weeks. During one of my recent fishing trips I landed 677 large fish in 17 hours, and abandoned the sport with my fingers in tact, not an abrasion of skin visible, thanks to a full supply of finger stalls.

With regard to lines, all that is required is a well laid cotton line, which can be purchased at any twine store for fifty cents per pound. This description of line is strong soft to the fingers and not liable to kink. Sometimes blue fish snap at the line between where it comes in contact with the water and the squid, and occasionally through the struggles of a fish to escape the lines are fouled, and one of the number is apt to pass into the mouth of the hooked fish. In either case the line is liable to be stranded, and unless knotted, may be parted by the next fish. If an expensive line is used, the fisherman will request the boatman to knot it. If knotted, the ends unravel and an attractive bait is presented, which hungry fish are apt to seize. If a cheap line sustains an injury, it can be cheaply replaced by a new one. With reference to the length of line to be used, I can but state that it must vary to suit the mood of the fish. If the fish are plenty, and in a biting humor, from forty to sixty feet will be ample; but if fish are scarce and dainty, from eighty to one hundred and thirty feet will be required.

For large fish—in spring and fall—I would recommend a well-laid cotton line seven-sixteenths of an inch in circumference. For summer fish from one to three pounds. I use a line five-sixteenths of an inch in circumference. For small lines, I prefer cotton-braided ones, which I purchase at Traver's twine store in Beekman, below Nassau street, New York. I find that the braided lines are less apt to tangle than small laid ones, and are more pleasant to the fingers of the fisherman.

It is amusing to inspect the various squids purchased by the uninitiated—spoons and spinners of all kinds, sizes and shapes, many of them ornamented with paint or feathers, metallic fishes of various forms and sizes, some with wide spreading tails to prevent the fish from being hooked, and a large proportion cast so as to represent scales. Blue fish will bite at a spoon or spinner, but to unhook the snappish customers is the rub; for if fingers come near their mouths, one or more are apt to suffer. When landed in the boat, they display gymnastic feats, and a spoon or spinner may undergo a change of form—presenting at the end anything but the lines of beauty. At various times I have tried spoons, spinners, artificial fish and squids of all kinds, sizes and shapes, and have arrived at the conclusion that nothing can equal a plain, round, white, bone squid for large fish, and for the first run, when even small fish are ravenous, I use a round bone squid five and a half inches long and two and a half inches in circumference at the thickest portion. For small or summer fish, my favorite squids are four and a half inches long and one and a half in circumference at the thickest point.

Hooks should be strong and reliable. For large fish, I use first quality Virginia hooks, (made by Job Johnson, of Brooklyn,) measuring in width one and three-eighths inches at point; and for small or summer fish, a Chestertown hook seven-eighths wide at point. I may remark that the good qualities of the Chestertown hook are not generally known or appreciated. I consider it one of the best and strongest hooks made. Last summer I presented Captain Joel Ridgway with a number of these hooks of the size referred to, and this spring questioned him regarding their quality. He assured me that they were unequalled for sheep head and striped bass, and that in February last he used them for cod fishing outside, and experienced no difficulty in landing fish weighing from eighteen to twenty-three pounds with these apparently slender and small hooks. With the exception of Virginia hooks for large blue fish, I use the Chestertown for all kinds of fishing, considering them the strongest and best hook made.

A difficulty to be encountered in using a bone squid is the tendency of the hook to slip—at one time leaving the bone in contact with the bend of the hook, and at another the shaft of the hook slipping entirely out of the squid. To render the hook immovable, I attach a shoulder of solder to the shaft of the hook at point where it comes in contact with end of squid. To prevent the hook from being moved out of the squid, I use several tight-fitting white pine wedges at side of shaft of hook as well as a long and tightly-fitting plug where the line passes out of the base of squid. When wet the pine swells, and generally renders the hook immovable.

I sometimes adopt another and more perfect method. I take a piece of No. 12 iron wire, and bend it so as to form a loop to receive the line. The wire is passed through the squid and cut off three-quarters of an inch beyond the end of same. I tin the shaft of the hook as well as the wire, after which I place them in position, and to prevent movement, bind the end of wire and shaft of hook together with fine copper or brass wire. Having some melted solder in a ladle, I pour it into the end of the squid so as to fill the entire cavity. I then apply solder to end of wire and shaft of hook, at end of bone, so as to make an angular shoulder about three-quarters of an inch in length—base of angle in contact with bone. The solder is dressed down by a file, and a useful and reliable squid is the result. Some of the readers of the FOREST AND STREAM will exclaim, *cui bono?*—why all this care and measured arrangement to catch blue fish? These fish can be caught with a piece of raw or wood, or a squid of any kind; but for successful fishing, proper appliances are all important. When fish are biting and the hook escapes

from the squid, the fisherman is compelled to stop and wedge his hook, and it tries his patience. For a trifling charge any tin smith will tinker the squids as described, and the blue-fisher will find them more satisfactory than the squids as usually sold.

As a general rule, blue fish merely nip at the end of the squid, and as hooks are usually placed in relation to the end of the squid, the fish are hooked in the edge of the mouth and tear out. To obviate the superficial hooking and tearing out process, I so arrange my hooks that the points clear the end of the squid from one and a quarter to one and a half inches. By this arrangement I generally hook my fish deep, and lose fewer than though I used squids as sold at tackle stores.

Hooking blue fish requires no tact or piscatorial experience; all that is required is to allow the squid to trail behind the boat. When landed the difficulty of parting company is the rub. The best mode is to throw the fish into the boat. Through their flouncing and head-shaking the squid is generally released. This failing the fisherman seizes the squid and elevates the hook and fish, and a few expert twists of the hand with the struggles of the fish sometimes suffice. This procedure failing, I seize the fish by the back of the neck with my left hand, and if a large fish, hold his body between my knees, and with the right hand tightly grasping the squid, wrench the hook from the mouth. In a recent number of the FOREST AND STREAM "B. Hackle" advised "Al Fresco" to experiment with a salmon fly in blue fishing, but he neglected to state how gut snoods would resist the dental efforts of the snappish customers, and moreover, as I have been injured by those fellows with all my care, I shall be very careful about using my fingers to unhook a salmon fly from the mouth of a blue fish.

The expert angler who can cast a fly or artificial minnow, and handle a nine ounce rod, may enjoy excellent sport among the blue fish, provided he uses a long shanked hook and gimp snoods. Numbers of these fish may be seen "breaking water" at any time on the banks and shoals of Barnegat Bay; and by using a small boat, the rod-fisher may enjoy his sport *ad infinitum*.

For successful blue fishing, the speed of the boat should be about six miles per hour. If motion is more rapid, fewer fish will be hooked, and a great number will tear out. If the boat moves slowly, the fish will discover that the bait is a deception and will refuse it.

One mistake made by novices is, in having too many fishing in the same boat. Three lines, one midship and one on each quarter can be successfully used, but two are preferable. Sometimes five and six fish from one boat, and the result is, that a fighting fish will entangle a portion or all the lines.

For successful blue fishing an experienced and industrious boatman is a *sine qua non*. Many of them take parties out and appear to study self alone—to obtain their fee with the least amount of labor. On one occasion, this season, I met two young gentlemen who had spent the day in blue fishing without obtaining a bite; yet, at the same time and in the same bay, I had averaged forty large fish per hour. But a few days since I was fishing in company with two friends, and in a short time we captured 154 fish estimated at 900 lbs—a greater weight than was captured by any six boats engaged in the sport at the time, and in the neighborhood. Our success was alone attributable to the tact, knowledge, industry and go-ahead-iveness of our boatman, Captain Joel Ridgway, of Barnegat. I have already expressed a favorable opinion regarding this gentleman, and must again assure your readers that if a fish is to be caught or a bird to be shot, he will find it. Captain Ridgway studies his employer's interest, and is ever ready to sacrifice himself for their benefit. His boat is one of the largest, the fastest and most sea worthy on the bay. There are *quantum suff.* of good boats and experienced captains at Barnegat; but Captain Joel Ridgway is my favorite when I can secure his services. I refer thus pointedly to this gentleman because I frequently receive letters of enquiry as to whom I would recommend.

Blue fish may be captured along our coast from Florida to Maine. It is a pelagic or wandering fish; and in March and April they are found off the Carolina coast; and from the middle of May until the middle of June large fish may be captured off the coast of New Jersey; and later in the season off the eastern States. About the first week in September, on their way south, they are found off the coast of New Jersey; and may be taken to the north of Hatteras until the latter part of December. Barnegat appears to be a favorite haunt for these fish; and on their travels north in May and June, they enter the bay, and may be caught in large quantities ranging from two to twelve pounds. On their return in the fall, they may be found inside the shoals and outside the bar ranging from eight to fifteen pounds. The small or summer fish, known as "snap mackerel," spend the summer in the bay and around the shoals, and almost any day from June 1st until September 10th excellent fishing can be obtained. The summer fish range from one to three pounds, although schools of larger ones occasionally enter the bay. Frequently, during the summer months, small schools of large fish can be found from two to five miles from shore.

In closing, I cannot resist the temptation of quoting the language of that genial fisherman, A. M. S., of the Philadelphia *Evening Star*, whom I have had the pleasure of meeting at Barnegat on several occasions:—

"I am aware that trout and salmon fishers will turn up their noses at blue fishing; but I attribute such feelings to ignorance of the sport. Having tried both, my preferences are decidedly in favor of the salt water blues, leaving our trouting friends to the full enjoyment of such sport as they can find in tumbling over rocks, wading waist-deep in ice cold water, untangling lines, refitting snoods," (not forgetting mosquitoes, back flies, the expense of outfit and cost of reaching distant points where good sport is obtainable.) "In fact it is impossible to conceive of anything more exhilarating than trolling for blue fish. It is exercise for mind and body, and unless a man is made of wood, he cannot, if the fish bite, fail to grow excited or even enthusiastic over it."

Amen! "so mote it be," is the only addition that can be added to the preceding remarks by AL FRESKO.

Beverly, N. J., July, 1874.

—Gilbreth Knox, the celebrated stallion, died at Beacon Park on July 26th. He was owned by Mr. Wentworth, who paid \$17,000 for him. The horse was entered for the great stallion race at Beacon Park in September next.

Rational Pastimes.

Secretaries and friends of Athletic, Base-Ball, Cricket and other outdoor Clubs will kindly mail their contributions not later than Monday in each week.

—On July 23d the Manhattan Club visited Staten Island to play a first eleven match with the Island eleven, and going there in full strength they came off victors by a score of 103 to 72. The weather was fine and the match was enjoyed by a large crowd of spectators. The Manhattans went to the bat first and scored 60 runs, after which Gilbert made the highest score, 26. The Staten Islanders could only offset this with 30, of which M. Eyre, of the St. George Club, made 11. In the second inning the Manhattans scored 43 to the Islanders' 42, the latter, therefore, being defeated by the total score of 103 to 72. In this last inning Cammell's 12 was the best score on the Manhattans' side, and Benson's 7 not out on the other. The latter carried off the palm in bowling, Errington leading on the other side.

—On July 10th and 11th the grand match at cricket between Eton and Harrow Schools took place at Lord's Grounds, London, and Harrow came off the victors by the appended score:

Umpires—Farrands and Price.			

—In the match, Gentleman vs. Players, which took place on Lord's grounds July 6th and 7th, the Players won by scores of 185 and 161 against 231 and 114; totals 346 to 345, with two wickets to fall. Hornby led the Gentlemen's score in the first innings with 63, and Yardley the second with 47; Lockwood leading the Players' score with 70, and Pooley with 39 not out. Hill and Shaw led the howling for the professionals and Buchanan and Grace for the amateurs.

—The New York Fly Aways were defeated by the strong nine of the Staten Island Base Ball Association on July 25th, at Staten Island, by a score of 17 to 15. The Island nine included Beavens, Worth, Dollard Jackson and Mort. Rogers of the old Brooklyn Stars; Beach of the Princeton College nine, and F. Rogers of the Red Stockings, professionals, of 1873. Fred. Crane of the old Atlantic nine has also joined them. They are the strongest amateur team now in the field outside of the leading college nines.

—The Fly Aways play the Chelseas to-day, July 30th, on the Union Grounds, Brooklyn—their future field for matches this season—and the Arlingtons on August 1st at the same place. The Chelseas play the Staten Island nine at the Island on August 1st.

—The Nameless Club again sustained defeat on July 25th at Prospect Park, this time by a score of 27 to 16, the Nassaus being the victors. Their experiment of playing a professional pitcher has not paid apparently.

—The Fly Aways had a game with the Mutuals July 21st, but they were easily defeated by a score of 16 to 4.

—The Mutuals left town July 26th for the West for a three weeks tour. They are to play in Louisville, St. Louis, &c., as well as Chicago.

—The professional contests since our last issue have been as follows:

July 20—Philadelphia vs. Chicago at Chicago.....	6 to 2
July 22—Chicago vs. Atlantic at Chicago.....	10 to 8
July 23—Mutual vs. Hartford at Brooklyn.....	13 to 5
July 24—Hartford vs. Philadelphia at Phila.....	8 to 4
July 25—Mutual vs. Hartford at Brooklyn.....	7 to 3
July 25—Chicago vs. Atlantic at Chicago.....	17 to 4

—The position of the championship contestants now playing in the professional arena—the Bostons and Athletics being temporarily out of the fight—is as follows, up to July 27th:

Club.	Games Won.	Lost.	Total.
Mutual.....	20	16	36
Chicago.....	16	16	32
Philadelphia.....	14	18	33
Hartford.....	10	17	27
Atlantic.....	9	20	29
Baltimore.....	5	23	28
Total.....	74	110	185

—The Hartfords came to town July 23d and sustained defeat at the hands of the Mutuals by 13 to 5 in a poorly played game. They then went to Philadelphia and offset their loss with a victory over the Pearls by a score of 8 to 4. On Saturday they again played the Mutuals, but again lost, this time by 7 to 3 only.

—The Philadelphia nine visited Baltimore and Washington July 27th and 28th, and the Mutuals play the Chicago nine in Chicago August 1st.

—The Atlantics, on July 20th, defeated the Maple Leafs of Guelph at Guelph by a score of 15 to 1.

—The New York Arlingtons visited Scranton, Pa., last week, and they had a pleasant series of games with the Modocs of Scranton, the Shumakers of Wilkesbarre, the Jeff Davis nine and the Providence Club. They also played the Binghamton Cricket Club a game. Their best match was with the Modocs, which they won by 10 to 2.

—The Confidence nine of New Rochelle had a visit from the Americus of Greenwich on July 21st, and they defeated the latter by 11 to 5.

—The Hoboken Waverlys defeated the Commercial nine of Wm. Kinsley & Co., at Hoboken July 25th, by 7 to 5, the game being a remarkable one in many respects, not a run being earned and scarcely a base but made.

The Horse and Course.

—On Wednesday, July 22d, at Fleetwood Park there was a trot for horses who had not beaten 2:50. There were eleven entries. Ice won by Minnie M. in four heats. Time—2:45; 2:45; 2:47; 2:45½.

—On the 24th a race took place at Fleetwood. Gussie and Jake. Won by Gussie.

—On Monday, July 27th, two trots took place at Fleetwood. First race won by George; time—2:43½; 2:43½; 2:43; 2:45. Second race won by George; time—2:47½.

—On the same day, at Waverly, N. J., a race took place between Lottery and Princess. Won by Lottery. Time—2:39; 2:41; 2:38.

—Deerfoot Park, July 23d, a trotting race for 2:40 horses. Won by Jefferson. Time, 2:42½; 2:41; 2:40; 2:40.

—At Beacon Park on the same day, best 3 in 5, mile heats, for 2:50 horses. Won by Bessie Hunt. Time, 2:45; 2:45; 2:49; 2:44. Also, a race for running horses, mile and repeat. Won by Eclair.

—At the Harrodsburg races, July 23d, the first race, for three year olds, was won by Kentucky Central. Time—3:12.

—First day of the Saratoga meeting, July 25th. The Travers Stakes, for three year olds, one and three quarter miles, had eleven entries—Atilla, Acrobat, Steel Eyes, Brigand, Rutherford, Grinstead, War Dance, Aaron Pennington, Reform, Julius and Asteroid. Won by Lorillard's Atilla. Time—3:08½, which is within half a second of Joe Daniel's famous time. The second event was for a Sweepstakes for All Ages, one mile and a quarter, with four entries—Springbok, Mate, Survivor and Dublin. Won by McDaniels' Springbok in 2:09½, which is very fast time. Following this event came the Flash Stakes for two year olds, half a mile. Olitipa, Willie Burke, Australind, Calvin, Bayminster, Ravenna, Victorious and Caroline entered. Won in the finest style by Olitipa in 47½, which is at the rate of 1:35½ to the mile.

—The Dexter Park races were concluded at Chicago, Ill., on July 24th, with the following events:—The first race was for a purse of \$1,000 for three minute horses. James Howell, Jr., won the three last heats. Time—2:27½, 2:31, 2:32½. The second race was for a premium of \$2,500 for horses that had never beaten 2:20, mile heats, best three in five in harness. J. S. Wade's Red Cloud won in three straight heats. Time—2:20, 2:24, 2:21½. The third event was a running race for a purse of \$1,000, all ages, two mile heats. Ed. Harrison's Falmouth, five-year-old won. The fourth race was the Consolation purse, a single dash of a little less than a mile and three quarters, which was won by Gleaner.

—On the 25th, at the Dexter Park, Chicago, a race took place between Goldsmith Maid and Fullerton against time, but the results were not satisfactory. 1st heat, Goldsmith Maid, time—2:29½; second heat, the Maid, 2:19½; third heat, the Maid, 2:25½. A heavy track and high wind all adduced as apologies for the slow time.

New Publications.

AN ANNOTATED LIST OF THE BIRDS OF UTAH. H. W. Henshaw. Salem: 1874.

This list of birds, a most valuable contribution to our ornithology, is based largely upon the material collected during the field season of 1872, while the author was with the exploring expedition under command of Lieut. Wheeler. Of the 214 species enumerated 160 were actually taken or noted by Dr. Yarrow and Mr. Henderson, and Mr. Ridgway has added valuable material to the list.

ELEVENTH ANNUAL REPORT OF THE NEW YORK SOCIETY FOR THE RELIEF OF THE RUPTURED AND CRIPPLED. May, 1874.

Treating, as does the FOREST AND STREAM, of athletic exercises, heralding the triumphs of the hardy oarsmen, pedestrians, or gymnasts, we do not forget that over training or taxing the constitution too much sometimes brings trouble with it. The Hospital for the Ruptured and Crippled, founded some ten years ago, pays especial attention to the diseases of the body which may either arise from accident or from inherent causes, and the report now before us shows, in a most comprehensive way, the vast amount of good done by the institution. Especially directing our inquiry to the cases of rupture, we find that 1,787 cases of rupture were treated up to the 30th April of this year, and of this large number the major proportion were either cured or materially relieved. The number of patients received increases notably every year, showing how great was the necessity for such an institution. Admirably conducted, governed by a board of officers and physicians composed of our first citizens, and most skillful surgeons, the report of the Board of Managers is of the most encouraging character. We note that Dr. Jas. Knight, the Resident Physician, pays a merited compliment to Mr. Herman Fluegel, the well known gymnast, who has, in former years, rendered very efficient service to the convalescent and paralyzed patients, many being greatly benefited by his skillful services.

DO SNAKES SWALLOW THEIR YOUNG? G. Brown Goode.

You may find many a scholar ready to affirm that every word old Herodotus uttered in regard to the geography of the ancient world was true, and you may find ornithologists and ichthyologists of to-day who are ready to back up antique lore, and who will declare, no matter how fabulous the accounts were a thousand years ago, that in each and every one there was some grain of truth. In Spencer's "Faerie Queene" the poet describes Error as a snake, and says:

"Soone as that uncouth light upon them shone,"

Into her mouth they crept, and sudden all were gone."

Brown, in his "Vulgar Errors," tells of the viper, "and how the young ones upon any fright for protection ran into the belly of the dam." As early as 1789 the subject was discussed, "Do Snakes Swallow their Young?" The pamphlet written by Prof. G. Brown Goode absolutely settles this curious subject. Placing the questions in the hands of the *American Agriculturist*, and asking for replies, no less than eighty letters were received by Prof. Goode, and in the FOREST AND STREAM quite a number of cases were cited, where it was absolutely proved from the testimony of the most trustworthy individuals, that snakes of certain species do swallow their young. Not only have the small snakes been seen entering, but issuing from their mother's mouths. It is curious, according to Prof. Goode's thorough researches into this subject, to notice that the American Indians founded some of their legends on the fact that the mother rattlesnake allowed her little ones to enter her mouth. Prof. Goode's pamphlet is thoroughly convincing, and the question "Do snakes swallow their young?" is positively settled in the affirmative.

For Forest and Stream.
NORTHWOOD CAMP.

WHERE sweet scented breezes blow,
Where moss-bordered springs o'erflow,
Where the bluest skies are seen
Through the arching evergreen.

Where the mist of morning weaves
Bridal robes o'er quivering leaves.
Dimpled ripples, laughing break
On the marge of crystal lake.

Mirror'd clondlets kiss and play,
Languid lilies float all day,
Till the evening's blushing rays
Bathe the hills in purple haze.

Softly o'er each shaggy height,
Droops the cool and starlit night,
Hunter's song, and flash of oar,
Wake the echoes on the shore.

Cheerily toward the forest home,
Trophy-bearing athletes come;
Now the genial blaze leaps higher
From the log-heaped, crackling fire.

Sun browned men, with eager zest,
Seek the woodland feast and rest,
Lull'd by music of the glades
Dream of bright-eyed wives and maids.

Fish Culture.

This Journal is the Official Organ of the Fish Cultur-
ists' Association.

FLASHES FROM THE "BLUELIGHT."

SECOND WEEK.

ALTHOUGH some foggy weather early in the week has somewhat restricted the number of the "Bluelight's" trips, yet the successful results of nearly every haul of the dredge when out, has furnished material enough to fully occupy all hands in the laboratory in preserving and classifying. No time has been lost since. Beginning near home, that we might familiarize ourselves with our immediate surroundings, we explored the eel grass shoals and others in the vicinity within the limits of Fisher's Island Sound. Then we went outside into rougher water, and to the eastward of Watch Hill. We lay for hours hauling the trawl and dredge on the sandy bottom, and rolling in the southeast swell in a lively fashion anything but agreeable. I fear that the occupants of the handsome hotels of that much hoteled sand hill, who gathered in crowds under the delightful shade of their umbrellas, and watched our proceedings with evident interest, formed an erroneous idea if they thought that happiness unalloyed existed in that trim little steamer, with her awnings and flags, gently rocking in the refreshing breeze. It looked fine, no doubt, but we on the spot knew how it was ourselves. Sounds of inward woe and tribulation could be heard faintly through the green baize screen which gives to one end of the "Bluelight's" saloon the dignified title of "after cabin," and a lack of interest was observable among a number of the party as the slimy contents of the dredges were dumped upon the examining table. There was no rivalry then. Harvard and Yale were each equally willing to relinquish to the other the precious plums in our mud pie, and the little "donkey," as it buzzed and spluttered and rapidly wound up and reeled in our lines, with its "dizziness-producing motion," wound up the enthusiasm of our collectors and sent them reeling away. Not all, though. Some had hauled dredges from a hundred fathoms deep in open sailboats in the Bay of Fundy, hauling in the slippery line from the icy waters by hand over hand, and of course our position was to them comfortable enough; others had in last summer's work in Casco Bay learned the tricks of the "Bluelight," and how to accommodate themselves to them, and were serene. Even at dinner time chowder had lost its charms to some, and frugal meals were made on pickles and hard tack.

Our party is now increased to eighteen naturalists, and is made pleasant by the presence of several ladies, who, interesting themselves principally in the sea weeds and mosses, have beautiful and valuable collections, and do not hesitate at wet feet or the prospect of a ducking to secure their coveted treasures. Students themselves in natural history, and members of families of gentlemen devoted to science, their labor this season will undoubtedly add much to the value of our work. And when we go out on calm, still evenings with small boats to capture with our towing nets the luminous crustaceæ and jelly fish, their presence and evident appreciation and enjoyment of the occasion turns the task into a pleasure. When fishing for these creatures silence is not necessary, and a little music does no harm. Collections of sea weeds and mosses make most beautiful albums, and I wonder are not more generally seen. Our collections, though, embrace not only the little silky filaments of purple, green and crimson floss, and delicate, translucent leaves, but have among them gigantic ribbons of dark green, scalloped and grooved, some thirty to forty feet in length—the *Laminaria longocervura* and *digilata*, for instance.

Our party has been subdivided, and, according to their several tastes, each branch of study has its devotees. Some make the "invertebrates" their specialty, and it is to these that the microscopes reveal the wonders of almost another world. Little eggs, no bigger than a grain of mustard seed, are placed in the focus, and there stand revealed within their transparent films little wriggling, twisting monsters, that one needs faith to believe will (or would have but for their untimely demolition on the altar of science) eventually become fish, crabs, lobsters, jelly fish, or other creatures, to whom no resemblance is as yet to be seen by the non-expert.

A little scrap, like a tiny black stick, or more like the tenth of a black pin, lying inert on the table, is placed in a saucer of water; from one end there protrudes at once a little antennæ—crowned head—and it begins to swim rapidly about in its prison, the weight of its tube (for it is a tube-worm, the *Serapus*) keeping it in an inclined position, like a man treading water. This creature is a rarity; one was

found fifty years ago in American waters, and described. European naturalists doubted; no worm of the tube maker carried his tube with him, but crawled from it when disposed for a journey. None had been found since, and the *Serapus* was set down as existing only in the imagination of the assumed discoverer. We found dozens of them in one haul of the dredge, and now its existence is beyond doubt. The crab and lobster receive great attention, and are made the subject of close investigation by some; and it is to be hoped that the knowledge gained in regard to them may prove beneficial, by enabling methods to be devised by which the rapidly exhaustive processes to which the latter is subjected may be checked, to the gain of the general community.

Our leading crab man is not here yet. A letter was sent him announcing the discovery of the eggs of the "fiddler crab," and that they were hatching. It is presumed that this will bring him, if alive.

Others more directly connected with the workings of the Fish Commission, turn their attention to fishes, and through their own exertions and the accommodating spirit that we find in most of the fishermen, and in the men managing and owning pounds and seines, procure many rare and valuable specimens. Two fine drum fish have been received—one skinned and dissected here, the other forwarded in ice to the Smithsonian Institution, where a plaster cast, colored from the original, will be taken of it, and his skeleton, nicely prepared, be kept for study. An occasional fine Spanish mackerel, or a bucket of soft shelled crabs, have their value, although not exactly in a scientific point of view. The people lend us a willing hand, and come daily with something new for the "professors." One "jolly young fisherman" came in with a hermit crab, divested of his borrowed shell. "I guess this chap is new to yer, ain't it?" he said, exhibiting his prize; "it's what we call a bait eater." "No," I said, "you are mistaken, it is a *Eupagurus bernhardus*, and generally inhabits the shell of the *Lunatia heros*." He gazed at me a moment, remarked "Gerry!" and turned away.

Fig. 1.—Young skate, natural size.

In endeavoring to further the interests of this portion of the work, I started out last week with Captain Chester on a cruise after bluefish and mackerel. The day was lovely, breeze fine, and everything just right; but although we worked hard, and tried all the waters from Fisher's Island to Montauk Point, running across Phelps' Ledge, and through the tide rips off the Point away out into the Atlantic, we did not get a strike. And the fishermen have since caught but very few in their pounds. The fish have evidently passed this point in their migration eastward, and

Fig. 2.—Egg of skate, half natural size.

if this week we do any better it will be because the schools off Barnegat—spoken of in last week's FOREST AND STREAM—pay us a visit before leaving for parts unknown. A few mackerel were all our count for a long day's fishing.

In spite of our bad luck, though, Noank promises well for the especial fish investigations. Situated at the mouth of Mystic River, the waters of the harbor, and to a certain extent those of Fisher's Island Sound, in the vicinity, are quite brackish, and it is probable that the young of many marine fishes will be found. It is one of the principal ts from which New York is supplied with fish, and some forty smacks of good capacity and fair proportions are owned here and employed in the fisheries, thus affording us good opportunity for collecting facts and specimens. More than forty species of fish have been already col-

Fig. 3.—Figure of clear-nosed skate (*Raja eglanteria*), showing eggs in position in the oviducts. a. a., Eggs. b. b., Ovaries, with immature egg. c., Junction of oviducts.

lected; nothing, however, of importance except the large "drums" (*Pogonias chromis*) before mentioned. This species seems to find here its northern and eastern limit, none having been taken at Wood's Hole on previous expeditions, although one, probably a straggler, was seen by Mr. J. H. Blake at Provincetown. Our own trawl has as yet brought up mostly flounders of several varieties, and skates, of which latter fish one haul covered our deck.

Most every one has seen the skate, and knows it by sight, but few would recognize in the young skate the characteristics of the matured one; and not one in a thousand but

would be puzzled to decide in what kingdom, animal or vegetable, he would locate the egg, although it is found frequently on our sandy beaches, thrown up by the waves with masses of sea weed, and resembling the empty husk of some curious nut. The egg of the skate is about two inches in length by one and a quarter inches broad, shaped like a sack, with four horns at the corners, each about two and a half inches long. This egg is composed of a parchment-like cover, and is of a dark green hue. Carefully cutting one open, the little skate is found within, lying quiet, as though lifeless, with its long tail coiled closely around its body and head; if very young, the fish is hardly discernible at first, for he is but little more than a little transparent line, resting on an oval mass resembling the yolk of an egg (which, for that matter, it is) nearly an inch in diameter; but carefully removed to a dish of water, he soon gains vitality, and with corkscrew movements of his tail endeavors to swim away, but is too securely anchored by the ovarian sac, and can only wriggle. In this state, to the naked eye, no fins are visible—simply a little line, enlarged at one end a trifle, where two specks denote the eye. A little later in life, had we left him alone, he would have presented an appearance more akin to that of the full grown skate. But between these extreme stages of his existence he has passed through many changes. At first a mere transparent line, with no fins nor gills, gradually little threads or *branchia* have formed from near to his head; he grows broader by degrees, and the tail, which at first represents nearly the whole of him, grows shorter in proportion; the *branchia* become transformed into gills, and a portion of the tail is either absorbed or dropped off, for at first there is a fair proportion of it, reaching beyond the caudal fin, and in the older fish the fin completes the creature as in other fish. These changes occur while it is still too young to eat clear of its locker of fresh provisions, which its ovarian sac supplies. But now, grown stronger, it can carry this with it as it swims. The beautiful pink and transparent straw color which marked the earlier stages of its existence have deepened into brown and yellow, and the spots and markings of the mature fish begin to appear, and finally it emerges from its egg, left thinner at one end, ready to go on its own way and seek its own living. The skate has one peculiar feature: the teeth of the female are very different from those of the male. In the former they are sharp and shaped like the teeth of a saw. In the latter, flat grinders, like those of the sheephead. As they probably feed on the same food, the "reason why" I can't find out.

During the week we have made nineteen successful hauls of dredge and trawl. One of the most important and interesting results of our explorations in Fisher's Island Sound is the discovery that in this immediate region there is a complete mixture of the northern and southern species of marine animals. Here we have captured in the same haul, animals which range northward from Greenland, Iceland, and Spitzbergen, together with southern species which extend southward to Florida, the West Indies, and Brazil. The delicate southern coral *Astrangia dana* is associated with the northern red anemone (*Urticina crassicornis*), and the elegant *Acyonium carneum*. Most of the new additions to the fauna of southern New England are Arctic species, which had never been found previously south of Cape Cod.

Next week we are going to see what we can find in the deep waters of the "Race," and with seventy fathoms depth, while nowhere near is there more than thirty, we will beyond doubt get valuable results, for depth gives low temperature, and low temperature new forms of life.

PRISCO.

SALMO QUINNAT AND SALMO SALAR.

BUCKSPORT, Me., July 14th, 1874.

EDITOR FOREST AND STREAM:—

In your issue of July 9th, F. M. Webber, of Charlestown, N. H., makes some remarks about the relative health and vitality of the young salmon of Maine and California, hatched from eggs distributed last season, which I think may lead to erroneous conclusions unless explained. After reciting the facts that the eggs of California salmon were taken from fish that were seined on their spawning beds, and those of Maine salmon from fish that had been impounded several months next preceding the spawning season, and that the young of the former enjoy the reputation of superiority in liveliness and fat growth, your correspondent remarks:

"Large numbers of both kinds were hatched in one hatching house this last winter, and I observed a vast difference in them. Many of the Maine alevins clustered down against the screens, and their yolk sac was continually being drawn through the wires and burst, in this way killing them, and leaving only the head and vertebrae on the inside of the screens. The California alevins were constantly struggling up stream and trying to jump very high cleats and reach the fall of water at the head of the troughs, making so much noise about it as to tempt me to go and watch them to see what they were about."

An explanation of these phenomena is offered in the following queries: "I would be glad to know if the different circumstances under which the spawn of the two different kinds of fish were taken may not have had a good deal to do with the vitality of the young fish, or is the difference only owing to the fish being of two different species?"

"May not the fact of the Maine salmon having been kept (so to speak) in a semi-stagnant condition of life for three months before the spawning season, have prevented the progeny from becoming as full of vitality as they should be?"

A careless reader of the above paragraphs might infer that weakness was the rule among the Maine salmon and the exception among the California salmon. Such, however, could hardly have been the intention of your correspondent, who would, no doubt, in making a full statement of the case, admit the existence of both healthy and unhealthy fish in each brood. I cannot doubt that the majority of the Maine salmon exhibited all the natural activity and vigor of the species, or that they crowded toward the upper end of the hatching trough or other place of confinement. Such certainly was the behavior of the Maine salmon hatched at Bucksport, where they crowded the upper ends of the troughs in dense bodies, and showed every sign of perfect health and vigor. If those hatched at Charlestown were generally deficient in these qualities it must be owing to some extraordinary circumstance not yet explained.

The whole number lost, both in the alevin and egg stage, out of the 160,000 eggs of Maine salmon sent to Charlestown was 19,003. This is not a large percentage, but is larger than occurred to the eggs I sent to most other parties; but by no means so large as the loss on most of the shipments of California eggs last season. I do not attribute these losses to original deficiency of vitality, but to certain unfavorable circumstances attending their manipulation at some stage or other. In the case of the California eggs a sufficient explanation is found in the fact that they were a long time on the way east, at a season of the year when the weather was warm and decay proceeded very rapidly. In the case of the Maine eggs in question I think I can offer a satisfactory explanation. Part of those sent to Charlestown were taken in extremely cold weather, ice forming readily in our pans, and constant care being necessary to prevent freezing of the eggs themselves, which was sure to occur when ice formed on the sides and bottoms of the pans. In spite of precautions

some of them were partially frozen. Most of these lots were afterwards examined, but it was not possible to pick out all of the defective eggs, since they varied little to the eye from the good ones. I intended to make a fair distribution, but as the loss at Charlestown was greater than the average, I suppose that in packing up the eggs an undue proportion of the frost-bitten lots was placed in the boxes sent thither.

My own experience, as well as that of other parties who have hatched Penobscot salmon (which has always been done with eggs taken from impounded fish) leads me to the firm conviction that the young hatched from spawn that has not been affected by any extraneous circumstances, such as I have alluded to above, are in health, vigor and hardness fully up to the standard of the species. In the first experiment that I tried the parent fish were confined from early July till November, in a pound which, in midsummer, was only fifty feet square. Yet the parties who received the eggs pronounced them and the young fish hatched from them the most healthy they had ever known, comparing them with eggs that had been received from the Mirimichi River and other points in Canada.

Your correspondent assumes that in our method of impounding salmon they are kept in a "semi-stagnant" condition. This is very far from the truth. The pound in use at Bucksport contains ten acres, contracted to not less than eight acres in a drowth, and is formed by stretching a stout net across the mouth of a cave in a natural pond. If 600 salmon are placed in it there is for each of them a space of two square rods of water, having an average depth of six feet or more—certainly room enough. During the most of the summer the salmon are quite active, leaping often with the greatest agility into the air. For experiment's sake the game qualities of the impounded salmon were tried last Sept. at my request by Mr. Stillwell, Chairman of the State Board of Commissioners of Fisheries, and other experienced sportsmen. Seven of them were taken out, marked, and returned to the water, and the universal testimony was that, in fighting qualities, they were not surpassed by the most vigorous wild salmon of the Mirimichi. When taken out at the spawning season they are, without exception, in fine condition, healthy and active, and there is nothing in their behavior or appearance to indicate that there has been any interference with the normal development of their re-productive functions.

When the two species, *salmo salar* and *salmo quinnat* are in perfect health, there may still be a difference between them as to "vitality," if by this term we are to understand strength, activity, size, rapidity of growth, hardness, fecundity, &c., just as there is a difference in these several respects between a shad or whitefish and salmon. In strength, size, rapidity of growth, and perhaps in hardness also, the palm must be given to the *salmo quinnat* of California. In fecundity, on the other hand, the *salmo salar* of Maine is far ahead, and this characteristic, combined with its generally admitted superiority as a game and table fish may, to say the least, be fairly taken to offset its inferiority in size and other respects. CHARLES G. ATKINS.

ARRIVAL OF THE CONNECTICUT SHAD IN BERLIN.—Some weeks ago we announced the transmission by the United States Fish Commissioner, to the *Deutsche Fischer-Verein* at Berlin, of a number of specimens of the best quality of Connecticut River shad. These were packed in ice with the greatest care by Mr. E. G. Blackford, of the Fulton Fish Market, and sent through the North German Lloyds. This was done in connection with a correspondence between the United States Commission and the *Fischer-Verein* as to the feasibility of introducing the American shad into German waters.

We are now happy to announce, thanks to the admirable packing of Mr. Blackford, and the care of the steamship company, that these shad arrived in good condition, affording an opportunity to Professor Peters, the distinguished head of the Berlin Museum, not only to prepare some of them as specimens in alcohol, but also to invite his colleagues to taste the flavor of the American fish. Professor Peters reports them as being most excellent, and he is much in hopes that the measures contemplated for sending a stock of young shad to Germany may be carried out successfully.

EASTERN FISH IN CALIFORNIA.—A private letter from the McCloud River, California, dated at camp, July 11th, where Mr. Livingston Stone is superintending the planting and hatching of the fish transported from the east in an aquarium car last month, says:—

"There are ten of us white men in all, besides the Chinaman cook, whose name, curiously enough, is actually Ah Sin. To-day we are putting up our large tents for hatching, a hundred feet long by thirty wide. Monday morning we begin to construct our fence across the river for trapping the salmon, which is no trifling undertaking, the river being eighty yards wide with a deep and very powerful current. We are all in first rate health and spirits in spite of the excessive heat. Thursday the thermometer at the end of our piazza (in the sun) stood at 139° and further along on the sand where our tents will be erected, it stood at 157°, the highest point which I ever saw the mercury rise, from the natural heat of the sun. The river two rods to the left is snow water, with a temperature of 57°: so you can make a change in temperatures of a hundred degrees in a single instant by jumping from the sand into the river." S.

MARINE ANIMALS IN FRESH WATER.—Prof. Ramsey, in *Popular Science Monthly*, states some facts which certainly have a most important bearing upon the attempts of our Fish Culturists to habituate shad, salmon, and other anadromous fish in salt water, and ought to encourage them to hope for complete success. He says:—

At the present day, animals commonly supposed to be essentially marine are found inhabiting fresh water. In the inland fresh lakes of Newfoundland, seals, which never visit the sea, are common and breed freely. The same is the case in Lake Baikal, 1,280 feet above the sea level, in Central Asia; and, though these facts bear but slightly on my present subject, seals being air-breathing Mammalia, yet in the broad mouth of the Amazon, far above the tidal influx of sea water, marine mollusca, and other kinds of life are found, and in some of the lakes in Sweden there are marine Crustacea.

INTERESTING BIVALVE DISCOVERIES.—The channel in Fore River, Portland, Me., is being widened, and in dredging it a large bed of oyster shells was found there some three or four feet under the bed of the river. The shells are of a very large size, some of them being eight inches long and four or five wide. The marks on the shells show the oysters to have been about eighty years old when they

died. The layers of earth upon the bed show it must have been in its glory some five hundred years ago, and the bed must have been as large as the large ones at the South to-day.

Natural History.

A RARE FISH—THE TARPUM.

A FISH stall has always had its charms for us, and Mr. Blackford's slab on Saturday last in Fulton Market was particularly attractive. Now you may wander through a fish market, either like one of Mrs. Barbauld's two little boys in the story book who never saw any thing at all, or like the other good little boy (of course he was good) who saw everything. A mass of fish are dumped down on the stand, and if you have a quick eye, if you are the most casual of observers, and even not up itchylogically, you may often discover quite a mine of nondescript wealth. What was in view, however, at Mr. Blackford's did not require peculiar scrutinizing. There extended at full length, full five feet six inches long, was one of the handsomest of fishes we ever saw. He looked as if Tiffany had wanted to make some huge fish out of solid silver, and had burnished a scale here, and there frosted another scale, so that the work perfectly flashed and sparkled in the sun. "Name it," said Mr. Blackford. "Came from Florida?" We said dogmatically. "No, caught off Port Monmouth yesterday." "Sure of that?" we inquired doubtfully. "Certain." "Then we replied oracularly, pray hand us FOREST AND STREAM of June 18th, and you will see that Professor G. Brown Goode, of Middletown University, has precisely described that fish, and get a bit of card and write on it TARPUM, or Jew fish, and stick it on the fish and it will save you no end of questions. Now will you be good enough to get us a herring? Not a smoked one." A boy was dispatched to the lower wholesale market and a small sea herring some eight inches long, was soon procured and laid on the big fish. "Now," we commenced, much to the edification of a distinguished audience, a negro boy, a lady boarding house keeper bent on cheap fish, and a market porter, "you will be pleased to observe that your big fish is but an enlarged, a copious edition of this insignificant herring. Just look at those two heads, one scarce an inch and a half in length, the other most a foot and a half long. They bear the most striking family resemblance. Note that protruding under jaw, how it comes up in a lump before, on both the fishes. Fins the same on both, save that just as Professor Goode says, there is a great prolongation of the last spine of the back fin. Little herring has not got it, but the great grandfather of all the *Clupeidae* has. (Just here looks of astonishment were visible in the audience, and the fairer portion of it retired apparently overcome). This big spine," we continued, "is fourteen inches long. Here you will see that nature too, yearns after uniformity, for we notice, what we have never seen stated before, that the pectorals too have this same spine, though not so large in proportion, as the dorsal one."

Just here the audience all went about their business, and we were enabled to get a closer examination of the fish. Such scales! We took two or three of the largest, which measured two and a quarter by two inches each, each one as beautiful as a shell, and tipped at one side with pure silver. We took his extreme breadth, which was one foot three inches. Down his throat we could have passed our double fist. Asking a fisherman if they were caught frequently, he informed us that he had seen two or three of these fish during his life.

Consulting later Col. De Voe's most excellent book, "The Market Assistant," we saw that the author states "that to his knowledge this very large and scarce fish has been seen but four times before in New York." The measurement coincided to an inch with the fine specimen we saw. Two tarpons Col. De Voe says he saw in 1865, and another in 1857. Referring to Professor Goode's article we notice that he states that "this fish is found occasionally in the waters of the West Indies, and on the east coast of the United States." The tarpum he declares to be *Megalops thrissoides*, and he tells us, as does our other correspondent, S. C. Clarke, Esq., from Smyrna, Fla., (see page 252, May 28) that it is taken in the St. Johns River and brought to Jacksonville. Of course we ate some of him boiled. Now we are constrained to state that generally the handsomer a fish is the better he tastes, and that sometimes the uglier he is (vide squid) the nicer he is. But *Megalops thrissoides*, tarpum, tarpon, or Jew fish, is dry fish, with an exaggerated tastelessness common to the herring. Sweet was it, but flavorless. Optimists as to fish, as far as their edible qualities go, we have no doubt, that converted into a mastodon Yarmouth bloater, *Megalops* would in small quantity, make a delightful relish for breakfast.

THE TARPUM.—Having written to Professor Baird in regard to the *megalops* described in another portion of this paper, the Commissioner of Fisheries has kindly sent us the following communication:

U. S. COMMISSION, FISH AND FISHERIES, {
July 21st, 1874. }

EDITOR FOREST AND STREAM:—

The *Megalops thrissoides*, or Tarpum, is a straggler along our coast, and has, I think, been taken as far east as Newport. A skin of this fish in the Smithsonian Museum came, I am confident, from that locality. It has also been noted as occurring more or less frequently along the coast of New Jersey. As this is one of the species not yet photographed or cast by the U. S. Fish Commission, I shall be very glad indeed if you

will see that the next specimen taken in good condition is forwarded in ice to the Smithsonian. Very truly yours, SPENCER F. BAIRD, Commissioner.

VORACITY OF FISH.—An Iowa correspondent calls our attention to the voracity of the fish that sometimes get into his basket. In two large bass that weighed three pounds or so, he found pickerel that measured five and eight inches respectively, and in a four pound pickerel he found a six ounce rock bass. So, we see that all fish prey upon each other, and in this respect are like Dow Jr's. fleas, which

"—have other fleas to bite 'em,
And so go on *ad infinitum*."

The facts are interesting, as showing that bass are not exempt from the attacks of pickerel, though it would seem that the chances are two to one on the bass.

THE GRAYLING AGAIN.

SAINT LOUIS, July, 1874.

EDITOR FOREST AND STREAM:—

I am reminded in chancing to pick up your Vol. II., No. 17, to say that about the year 1845 I first made acquaintance with *Thymallus tricolor*, about which many articles have appeared in your paper. We caught that fish in Holland, County of Orleans, State of Vermont, within two miles of the boundary of Canada, near latitude 45°. The next year we caught others in Newton Pond, now near line of Grand Trunk Railroad and not far from Island Pond. My fishing companions were, then, Daniel B. Cobb and John G. Gilman. We all lived at Derby Line, Vermont; they are both dead. When I hooked that curious fish and landed him, his appearance recalled to my mind a description I had read in an English work of the grayling, and I so named the specimen then before my two companions. While they conceded the beauty of the fish and accuracy of the description, as I repeated it from my recollection, they utterly refused to assent to my assertion that our specimen was grayling. Poor fellows, they are gone now, or I might convince them of the correctness of my assertion. We cooked that fish and found his flesh delicious—whiter than trout, very firm and sweet. The illustration in your number of June 4th is a perfect representation of the general appearance of our fish, and fully confirms my belief that our specimen was a grayling.

Provided I am correct concerning the fish referred to, it only proves the grayling to be common to different degrees of longitude, and so far as known, found in the United States and Territories in about the same degree of latitude. They may be rare at the eastward, or for aught I know, abundant, and like woodcock, seldom seen, unless sought for. Respectfully, JOSEPH JONES.

CENTRAL PARK MENAGERIE.

DEPARTMENT OF PUBLIC PARKS, {
NEW YORK, July 26, 1874. }

Animals received at Central Park Menagerie for the week ending July 25, 1874.

One purple Gailmule, *Gallinula martinica*. Presented by Mrs. Pinckney Walker.

Five Horned Toads. Presented by Mr. Wm. Hutchinson, mate of steamship Waco.

One golden crowned Conure, *Conurus pertinax*. Hab. Cen. America.

One Agouti, *Dasyprocta aguti*.

One Curraon, *Cyrax alector*.

Two Guinea Pigs, *Cavia cobaya*.

Three Monkeys.

W. A. CONKLIN.

—F. C. de Nehsosnova's little incident in bird life will appear next week.

Woodland, Lawn and Garden.

THE CURCULIO ON THE PLUM.

"How shall I kill the rascal?" This inquiry was made to the *Woodland, Lawn and Garden* department of FOREST AND STREAM, and although somewhat late in the season to use effectually all the known remedies for the preservation of fruit, I give for the benefit of all, my own *experime ital knowledge*, and its general safety and good results.

In speaking upon this highly interesting subject, I notice, first, that "Nature has an antidote for most of the ills of Nature;" and if the Agriculturist has, as the world grows older, new as well as old enemies to contend with, he also finds an increasing amount of knowledge beneath his hand, the accumulated weapons of years of experience and observation. If he must fight, he fights intelligently, and not in the dark.

I have given considerable attentive observation to the culture of the plum, and as a matter of course, in common with others, I have met the insect enemy, the formidable *curculio*—the "plum cuss" were a better name for this destroying bug or worm. I have had some forty years' experience as an agricultural student, under the best teachers, and, for a considerable length of time, had the benefit and teachings of that best of masters, A. J. Downing, Esq. I have learned among other things that, although I have learned many things of value in agricultural science, I am still only a learner like many others in the great studio of the world.

My earliest attention (1835) was called to the ravages of this formidable insect by a gentleman who, in a communication from Ohio, stated his grievances and his observation of the habits of this insect, and his own application of natural remedies. After experiments of my own, I found his theory to be fully confirmed and well sustained by carefully made tests for three years, always with success. Whenever you can, therefore, use the means provided by nature, always at hand, be sure to do so. The means used under the head of *natural remedial agents*, are, first, the crude and pungent ammoniacal manures. The curculio, or plum weevil, has a very nice sense of smell, and therefore when a very pungent odor is given to it as a breathing atmosphere, it dies, or leaves the place. From my own observation, I am quite sure that the manure of swine and hens will effectually protect, if not entirely prevent, the attack of curculio. To this you may add strong wet horse manure, laid around the trunk of the plum tree. Knowing the habits of your enemy, you may attack him in his stronghold, and you are also well aware that he always fol-

The Kennel.

—Last week the steamer City of Richmond brought two black and white setters from England for a gentleman in Pittsburgh, Penn. His name we could not ascertain, nor the party from whence they came, as the tag with the name appended had got detached, and no one on the vessel seemed to know anything about them further than that they were for a gentleman in Pittsburgh.

—We may look forward to some very fine progeny by "Mohawk's" Macdonald's "Milo" out of Dr. Gautier's Lavcrack "Ruby."

—A correspondent, W. H. W., of Philadelphia, writes to us as follows:—

"I have seen once or twice in your paper an article referring to biscuit for feeding dogs on hunting trips. The idea strikes me that it would meet a difficulty often experienced by sportsmen, at least one that I have often felt in finding proper and nourishing food for my dogs while in the woods. Please inform me whether the article is manufactured in this country? If not I believe it could be made profitable, and may possibly start a person at it. Will you be kind enough to furnish me a recipe for making the article."

We answer that a gentleman of this city has the matter in hand, and has procured the bona-fide receipt from England. The duties, charges, &c. on the importation of the biscuit you speak of would add so materially to the price as to render the article almost unsaleable.

NOT HYDROPHOBIA.

SHELBYVILLE, TENN., July 21, 1874.

EDITOR FOREST AND STREAM:

A little incident occurred this morning at my house, that caused me to bless the day I first began taking FOREST AND STREAM. The hydrophobia that has been raging in New York, of course has excited a great deal of interest in the minds of the lovers of the dog. I have two very fine dogs, a setter and a pointer, so to save myself (and them if possible) in case the hydrophobia got down this far, I have been carefully reading all articles that you have published concerning the disease. But now to the "skewer." When I came up to breakfast this morning I was very much surprised to see all the doors and windows down stairs closed. I entered the dining room, and the first words I heard were these from the ladies: "Oh! we are so glad you've come. We are frightened nearly to death. 'Czar' has gone mad, and we don't know what to do." "Where is he?" I asked. They told me that he was lying down by the north side of the house, foaming and whining, and that he would pay no attention when he was called. Of course I went immediately to the place, for I was certain it could not be hydrophobia. I had been carefully watching my dogs for some weeks past, and they had shown none of the symptoms so plainly described in FOREST AND STREAM. I found my pointer lying by the wall foaming at the mouth, as they had said, and seeming in great agony. "Czar," old fellow," I said, and he wagged his tail feebly. This was a good sign, and I went up to him to make a closer examination. For all the world he looked like a dog that was either mad or had been poisoned. I stooped down, and making him open his mouth by pressing his cheeks against his molars, I looked down his throat. The cause of his strange behavior was in full sight, for the poor fellow had gotten a stick crossways in the roof of his mouth, too far down for him to get at it with his paws, and so firmly fixed that he could not eject it with his tongue. I inserted my hand and had it out in a moment, to the great delight of "Czar," who danced around me for some minutes in the exuberance of his joy. I do not wonder that he suffered, for the stick was a piece of rose bush, with a large thorn sticking down, so that every time he moved in the act of breathing, the flesh came in contact with the thorn, and of course caused great pain. As it is, his tongue is pretty badly scratched up.

I write this to show you that your paper has done some good, for if I had not read your articles, I would have thought sure that my pointer was mad, and—my Webley Central Fire would have done the rest. And now, Mr. Editor permit me to thank you in the name of him whose life was saved through your instrumentality, for the information that enabled me to defeat the intentions of "pallid mors." By the bye, your last number enabled me to find out something that I have been trying to do ever since I began taking the paper, viz., who "Piseco" is. In an editorial you mentioned that the Captain of the "Blue light," and "Piseco" were one and the same person. When I saw this I seized my "Harper" for July, and in the article entitled "The Net Result," I found the real name of the gallant officer, "who," as Mr. Wyckoff says, "is the right man in the right place."

BEDFORD.

—One entire family of seven persons were bitten by a mad dog at Newburgh last week.

TOBY AND CARLO.

EDITOR FOREST AND STREAM:

Almost every field sportsman has a way of his own in training his dog, and so long as it accomplishes the end desired without injuring the natural good qualities of the animal, all is well.

"Veritas," in FOREST AND STREAM, gave us a practical paper upon training the dog over different kinds of field game. In the main I agree with him, and endorse his method as one deserving the consideration of every sportsman. I have, in days long ago, been deemed a tolerable good shot, and could generally fill my bag at Scituate, Falmouth, or in the Valley of the Merrimack, with either woodcock or quail. I generally have found that a dog educated to point well on woodcock would prove, if carefully trained, a reliable animal on quail and most other game.

One fact noticed by "Veritas" has been confirmed by my own experience with four different dogs, viz: that the dog, particularly if quite a young one, will always go for that kind of game which he had first killed over him. It is an established rule to train a dog in field shooting after his apparent instincts, i. e., if he manifestly takes to the woodcock, you will do well to thoroughly train him in grounds where only woodcock are to be found. He is always sure to point the woodcock in preference to the quail, providing there are two of these birds in the field not far from each other.

One fine afternoon I was having good shooting in the Merrimack val-

ley. I had bagged eleven fine woodcock, when my dog, after bringing in the last bird, made a point in the same direction as the one over which I shot the last bird, yet about 2½ rods from the place where I killed the woodcock two rods nearer to the dog. I advanced, and three fine quail rose at once from the hummock, two of which I brought down with one barrel, and at a long range the third. After bagging my birds I measured the distance from the place where the first bird was pointed, and it was magnificently done; and the distance at which the other birds lay from the dog was 2½ rods less than the woodcock was pointed. Now, do not dogs have a choice of game as well as men?

Now Toby, my quail dog, was an aggravating fellow. Out in the woodcock shelter he went on, head up and tail "a wagging," right into the bushes, and whew! up went several woodcock, and if I got a shot and bagged a single bird it was a "snap shot," and to the action of Toby I owed no thanks. But let there be one, or a covey of a dozen quail in this place, and you saw the good points of Toby at once. He was sure of quail, and if he pointed straight you were never disappointed, and had only to walk directly up to him and sight over his nose and you saw your game right before you.

I am very well convinced that the best way to secure good, easy shooting, is to keep two well trained animals of your own; one for the noble sport of woodcock, and the other for quail shooting, and never let them go out with you into the same cover together. I have found them then to spoil sport most emphatically. Use your own dogs, and if you shoot with a friend never yield up your dog to the control for a single day of the "crack shot" of the neighborhood.

Carlo was a splendid spaniel owned by myself, and I have bagged many woodcock with him; but I found by repeated experience that if Carlo went out for a day's shooting with my best friend it took me generally a week to recover him to his former good behavior.

L. WYMAN.

AMENDED GAME LAWS.

SINCE publishing our Table of Close Seasons for Game, amendments have been made in the laws of several States, which we deem it important to publish, so that our readers may make the necessary corrections in the Tables received from us.

NEW YORK.

The New York Legislature, in its last session, did a good deal of tinkering with the game laws of the State. April 21 an act was passed for the protection and preservation of fish in that portion of the Wallkill River in the counties of Ulster and Orange. All fish taken from the stream must be caught with hook and line. March 11 an act was passed making it unlawful to take any fish out of the waters of Queechy Lake, Columbia county, for a period of three years. February 27 an act was passed forbidding persons to take fish in Honeyo, Seneca, Cayuga and Canandaigua Lakes in any other way than with hook and line. Eels may be speared. An act of May 11 declares that quail shall not be captured or killed in the counties of Genesee, Cayuga, Wayne and Orleans for the space of three years. An act of May 12 protects the fisheries of Cross Lake, Onondaga county, also of Clyde and Seneca rivers, in the counties of Wayne and Cayuga.

An act of May 6 is for the preservation of fish within the county of Cortland. An act of May 9 makes it unlawful to kill or chase any moose or wild deer in any part of the State save only during the months of September, October and November, and no person shall expose for sale or sell or transport the flesh of these animals during any other months than September, October, November, December and January. It is further declared that no fawn shall be killed in its spotted coat. May 20 the following was passed:—

§ 10. No person shall kill or expose for sale, or have in his possession after the same has been killed, any robin, brown thrasher, meadow lark or starling, save only during the months of August, September, October, November and December, under a penalty of five dollars for each bird; and in the counties of Kings, Queens, Putnam and Suffolk, no person shall kill or expose for sale, or have in his possession after the same has been killed, of said birds, except meadow larks, in this section named, except during the months of October, November and December, under a penalty of five dollars for each bird.

§ 2. The nineteenth section of said act is hereby amended to read as follows:—

§ 19. No person shall at any time catch any speckled trout with any device save with a hooked line, except for the purpose of propagation as hereinafter provided, or place any set line in waters inhabited by them, under a penalty of fifty dollars for each offense; and no person shall at any time, except for the purpose of propagation as aforesaid, catch any kind of fish in Lake Saratoga, in the county of Saratoga, or in Onondaga or Oneida lakes, tributaries or outlets, except minnows, with any device save with hook and line. And no person shall at any time use more than three lines with hooks attached; and any hook and line unattended by the fisherman in person, and all set lines, nets, traps and devices other than fair angling as aforesaid, are hereby prohibited on said lakes and their tributaries and outlets, or within one mile of the lakes, and when found in use or operation are hereby declared forfeit and contraband, and any person finding such set lines, nets or traps in said waters is hereby authorized to destroy the same, and any person fishing with such prohibited means or devices shall be liable to a penalty of not less than ten nor exceeding one hundred dollars. And no person shall take or catch any black or Oswego bass in the waters of Lake George, except from the twentieth day of July to the first day of January, under a penalty of ten dollars for each fish so taken.

§ 3. Section twenty-five of said act is hereby amended so as to read as follows:—

§ 25. No person shall kill or catch any fish in the Mohawk or Clyde rivers, Irondequoit Bay, Braddock's Bay, Little Pond, Round Pond, Cranberry Pond, Buck Pond and Long Pond in the county of Monroe, or in the inlets thereof, or the lakes in the counties of Westchester, Rockland, Wyoming, Columbia, Ulster, Genesee, Orange, Putnam, Herkimer, Rensselaer, Sullivan, Tioga, Cortland, Broome and Livingston, by any trap, dam, weir, net, seine, or by any device whatever, other than that of angling with hook and line or with a spear, under a penalty of twenty-five dollars for each offense. All fishing in the aforesaid Braddock's Bay, Little Pond, Round Pond, Cranberry Pond, Buck Pond and Long Pond in the county of Monroe, in the months of January, February and March, or either, is hereby forbidden and prohibited.

§ 4. It shall not be lawful between the first day of December and the fifteenth day of April in any year, to take

lows an insect instinct that leads to the selection of the very tenderest and best varieties of plums. They are not so foolish as to select trees on which to deposit their larvae or chrysalis, which, in the course of events, must lead to its destruction. The great law of instinct here seen gives direction to their habits. Hence our knowledge of the kind of warfare we are to adopt. In Trumbull county, Ohio, in 1835, this pest was found in myriads, and it came literally "out of the woods." It breeds in our forests and woody places, and an hour with my microscope has shown me hundreds of these insects, not only upon twigs and trees in the woods, but also upon some of our succulent plants. I have quite a number of well attested facts, derived from unquestioned sources, showing that the remedies to be relied upon are what I place among the natural remedies. A gentleman from Pennsylvania says, some years later: "I believe in your natural remedies for the extermination of curculio. Of all my trees, none have given me any fruit except one growing beside the fence of my pig yard, which has the benefit of its pungent manure. It ripened two bushels of fine fruit. I have one hundred trees of apricots and plums, and all told from them I have not obtained two bushels of fruit." I received some three years after this a letter from the above writer, in which he says: "Thinking the swine manure drove away the curculio, I removed all my small trees, and made an enclosure for them near to my hog pen, and gave the hogs access to them at certain seasons, with the grandest results. Full crops of fine fruit, and the pigs are my best protectors."

Once the curculio was considered an enemy of such power that many skilled agriculturists gave over the thought of ever subjugating him. One intelligent gentleman from Ohio writes me: "I have about given up my plum trees to the devourer, the curculio." Others had not force or energy sufficient to look the enemy in the face. In 1848 a gentleman in Pennsylvania wrote as follows: "I have tried your remedy, and a good one, by the way; I tied large open-mouthed bottles, partly filled with molasses and water, to my plum trees, also bags containing a half pint of salt to the limbs, and applied one peck of manure from the hog yard, mixed with one pint of salt, to the roots of the trees. I had a good crop of plums this year under this treatment. Last year I had not one peck of fruit. On examining the bottle every day, I had from one pint to two quarts of all kinds of bugs and insects, wasps, &c., safely bottled up." I use upon my own trees, and have for years, as a manure for small-sized trees, say one peck of manure from the hog pen to one pint of salt and one pint of sulphur, mixed together, with occasional applications of powdered gypsum and sulphur direct to the trees when in blossom, after a rain. I have always had good crops.

The curculio generally commences its operations directly after the falling of the blossom, and until the fruit is as large as a hazel-nut it is not safe, but must be carefully examined. During the many years of my investigation of the habits of this insect, I am quite sure that of the many remedies that have been applied for the preservation of the fruit against its depredations, of the natural remedies the farmer will find the hog manure and salt, the coarse wet horse manure, and in this connection the use of open-mouthed bottles, filled with either honey-water or molasses and water, the best applications. I have used them successfully, and I have full faith in their efficacy if rightly applied. The ground should be often stirred around the roots of the trees, and all droppings of fruit removed at once.

Much reliance was placed in the use of gypsum and sulphur as protection to plums from the curculio. In 1851 I made use of this remedy: gypsum four parts to one of flour sulphur, and after a rain applied in dry powdered form to my trees. The result was a good crop of plums. I repeated this for four years with the same good effects. Other persons in my own vicinity had the like good success attending careful applications of the same, with careful attention to their trees. This is to be applied when the trees are in blossom only.

The worst time for the plum tree, or its time of peril, is when the curculio insect begins its deposit of ova, generally at the time when the fruit is about the size of a pea. This insect both ascends the tree and flies from tree to tree, over high fences, and seemingly under the most adverse circumstances. I have seen them many times at work, making their punctures or incisions in the plum, and depositing generally only a single egg. Here the work has commenced. In time these eggs become larvae, or grubs, that feed upon the pulp of the plum, and the result is, the fruit soon falls to the ground before it is ripe. After this larvae or grub has attained full size, it leaves the plum and burrows into the earth beneath the tree, and here it tarries about twenty to twenty-two days, and when next he introduces himself to you he is a full fledged, perfect insect, ready to go on with the war, and lively as a cricket. These new rascals ascend or fly into the tree, and go through with precisely the same routine of operations that I have just described.

Such is the curculio, and such are some of the numerous and interesting facts connected with its existence. I am in possession of many other facts and microscopic discoveries relating to this insect, and the modes of protecting our trees from its ravages. I have given one sure natural remedy, a check-rein upon its devastations. I will give one other, of an entirely different character, easily tried by any one, and by myself also attended with good results. It is simply to soak corn-cobs in warm molasses and water until they become quite soft, or thoroughly saturated; then, with a piece of twine, suspend them upon the branches of the trees, twenty or thirty to a moderate-sized tree, shortly after the blossom appears; change the cobs every two weeks. The insect will deposit its eggs in the cobs in preference to the tree or fruit. I tried this very simple remedy, with variations and improvements of my own, and have much faith in its efficacy to preserve our plums. Be careful to burn your cobs on removing from your trees. They will be found filled with eggs and insects.

OLLIPOD QUILL.

LAWRENCE, Kan., July 20th, 1874.

EDITOR FOREST AND STREAM:—

I frequently get poisoned with ivy, though I always avoid contact with the stuff. A few days since, being in the woods, a party brought me a handful of the leaves to know what they were, and of course I was poisoned at once, while the person having them in hand suffered no inconvenience. Being advised to try a bath of buttermilk, I did so, and was relieved in a day or two. On going to bed I dipped a towel into fresh buttermilk, bound it about my face, which was quite well in four days, while spots of poison on my arm which were not treated in the same way were a week healing. I notice that only light-complexioned persons seem to be susceptible to the poison.

B.

with hook and line, trap, net or any device whatever, any fish from Rockland Lake, in the county of Rockland. Any person violating any of the provisions of this section shall be deemed guilty of a misdemeanor, and upon conviction thereof shall pay a penalty of not less than five dollars, nor more than fifteen dollars, or be confined in the county jail not less than five days nor more than fifteen days, in the discretion of the court.

NEW JERSEY.

For deer, December 1st to October 15th following; penalty for violation, \$50. For gray snipes, April 25th to September 1st; for woodcocks, July 5th to January 1st; for quails and pheasants, November 1st to December 31st; for rail and reed-birds, September 1st to November 31st. The penalties for the killing of birds out of season range from \$5 to \$15.

With respect to game fish the law provides that no person shall at any time catch any speckled trout, bass or salmon with any device save only hook-and-line, and only from April 1st to August 15th. The same provision applies to black bass, pike or pickerel, between March 1st and June 1st under a penalty of \$25 for each offence.

No set net or nets can be placed across any of the canals, rivulets, thoroughfares or creeks of the State. Penalty for violation, \$25.

MARYLAND.

The Maryland Legislature at its last session passed an act for the protection of speckled trout in the waters of that State. The first section provides that it shall not be lawful for any person to take any speckled trout in any of the waters of this State after the passage of the act, save with a hook and line, or to have any such trout in possession except during the months of April, May, June and July, and the first fifteen days of August, under a penalty of five dollars for each fish so taken or found in possession.

The second section prohibits the taking of any such trout in any of the waters of the State by means of fish baskets, nets, seines or traps, under a penalty of five dollars for each fish so taken.

The third section prohibits the placing of lime or other deleterious substance in any of the fresh waters of the State, without the consent of the owner, with the intent to poison or catch fish, under a penalty of one hundred dollars.

The fourth section provides that where any one erects an artificial pond upon his own land, or land of which he is in legal possession, for the purpose of propagating fish, and shall give notice thereof by publication in a newspaper of the county, or by printed or written bills put up in public places near said pond, any person thereafter catching fish therefrom shall be guilty of a trespass, and in addition thereto shall be liable to a fine of five dollars for the first fish, ten dollars for the second, and twenty dollars for the third and for each subsequent offence.

The fifth section provides that persons engaged in the artificial culture of brook trout may take from their own ponds in any manner and at any time such trout, and may sell or transport them, and dealers may sell them, provided that the packages containing them are accompanied with a certificate of a justice of the peace that such trout are sent by the owner or by agents of persons so engaged in their culture.

None of the provisions of the law prohibit the taking of fish at any time and in any manner from artificial ponds by the owners thereof, or by the authority of the owner. We give the substance of this act fully, because some of its provisions may immediately affect our readers.

OHIO.

It shall be unlawful to catch, kill, or injure any sparrow, robin, blue bird, marten, thrush, mocking bird, swallow, oriole, red bird, gross beak, cat bird, chewit or ground robin, pewee or phoebe bird, wren, cuckoo, indigo bird, nut hatch, creeper, yellow bird, fringilla, yellow hammer or flicker, warbler or finch, mavis, red stark, dummock, nightingale, cross bill, European quail or corn crane, Hungarian robin, European black bird, great tit or blue. Quail and Virginia partridge are not to be killed between the first day of January and the fifteenth day of October. Ruffed grouse, prairie chickens and blue winged teal, mallard, wood duck or any wild duck, wild geese or brant, between the first day of January and first day of September, and woodcock between the first day of January and the fourth of July. Rabbits and hare are not to be killed between the 1st day of January and the first of October. It is unlawful to snare or trap quail at any time, or to use swivel or punt guns for, or to use push boats or sneak boats, within the State of Ohio, in pursuit of wild fowl. For disturbing eggs of birds protected by this act, a fine not less than two dollars nor more than twenty-five dollars is imposed. If notice is placed on a man's land, or a verbal order is given by the owner of the land, it is considered as protecting the property. A fine is imposed of not less than five dollars or more than twenty-five dollars, or imprisonment of not less than five days or more than thirty days, to those trespassing, or offending by shooting on such premises.

It is unlawful to shoot or kill deer in any way, between December first and October first. It is unlawful for any person to purchase or offer for sale game or birds during the close season, no matter where they came from, and persons having such game on hand for sale are liable to the same penalty as if they had killed it.

Our correspondent, Hon. H. O. Collins, of Hillsboro, Ohio, has sent us the following letter and criticism of this law, which we think worthy of consideration:—

HILLSBORO, Ohio, July 8th, 1874.

EDITOR FOREST AND STREAM:—

Though in some respects objectionable, it is perhaps as good as could be expected, considering the conflict of opinions upon the subject. Closing the quail season on the 1st of January is an improvement, for between deep snows and lack of cover and food, they have a hard time in winter; but with this early closing of the season it should commence the 1st of October, when most coveys are fully grown. The late broods are owing to the failure of the first, for after long and careful observation I have not been able to satisfy myself that a second brood was ever attempted by the first succeeded. Great numbers of nests are disturbed by the cutting of meadows and grain fields in June and July, and the birds will rarely return to them, but begin anew. No matter how well grown the coveys, the old cock and hen will be found with them, "barring accident."

The close season for pinnated grouse ends September 1st, as is proper. There are but few of these birds in Ohio.

The spring killing of water fowl, though objectionable on the waters of Lake Erie, is less so on the Ohio and its tributaries, and it will be difficult to enforce it. The farmers have at length got a strict protection against shooting on their enclosed lands, for which they have long con-

tended. They have been subjected to so much annoyance from pot hunters and reckless persons, that it is no wonder they feel sore upon the subject; but most of them will freely give the privilege of shooting on their land to those who will not abuse it.

The principle embodied in the report I made to the Senate of Ohio in 1861, a copy of which I sent you, are in the main carried out, and it is gratifying to see the increased attention which is paid to the subject, as it will tend to more thorough and accurate information, and of course more perfect legislation.

H. O. COLLINS.

MICHIGAN.

SECTION 1. *The People of the State of Michigan enact*, That it shall not be lawful hereafter at any time to fish with seines, trap nets, pound-nets, or any species of continuous nets, during the months of March, April, May and June, or by spearing or shooting in any of the waters of the State of Michigan except Lakes Michigan, Superior, Huron, St. Clair, and St. Clair and Detroit Rivers and Lake Erie: *Provided*, Nothing in this act shall be construed as prohibiting sole owners of fish ponds from fishing therein, as they may think proper.

SECTION 2. Any person offending against the provisions of this act shall, on conviction thereof, be liable to a fine of not over one hundred dollars, or imprisonment in the county jail not over sixty days, to be determined by a court of competent jurisdiction.

GEORGIA.

—The following law is in force in Georgia:

WHEREAS, a continual wholesale and ill-seasoned destruction of deer, partridges and wild turkeys by shooting, hunting, trapping, and other means, has threatened to exterminate and utterly destroy the breed and growth of deer, partridges, wild turkeys, and other birds hereinafter described, in the counties of Chatham, Bryan, Clark, Fulton, and DeKalb; and, whereas, the breeding season of deer, partridges, wild turkeys, etc., is between the months of April and October of each year, during which season the killing or trapping thereof is excessively cruel and not productive of good to the people of said counties, or of the State of Georgia, it being conceded by eminent medical experts that the flesh of deer, partridges, wild turkeys, etc., when obtained by trapping, or when killed during the treading season is, for sanitary reasons, improper as an article of food. Therefore,

Section 1st, *Be it enacted by the General Assembly of the State of Georgia*, and it is hereby enacted by the authority of the same, That the shooting, killing, trapping, or destruction of any deer, partridge, wild turkey, wild duck, mocking bird, dove, red bird, nonpareil, or any insectivorous bird between the first day of the month of April and the first day of the month of October of any year, shall be held and determined a misdemeanor, and shall be punishable by fine not exceeding five hundred dollars or imprisonment in the county jail not exceeding six months at the discretion of the court.

Section 4th, *Be it further enacted by the authority aforesaid*, That the trapping or shooting, killing or destruction of any mocking bird, red bird, nonpareil, or any insectivorous bird or birds of any kind, at any season of the year, shall be punished as provided in section first of this act.

CANADA.—We reprint from our issue of March 5th a table of close seasons for game and fish in the Provinces of Quebec and Ontario, Canada.

In New Brunswick and Nova Scotia rod-fishing for salmon is permitted until September 15th. Fishing for black bass is forbidden between the first day of August and the first day of April.

ONTARIO GAME LAWS.—The following is the new game Act in the Province of Ontario:—

Deer, moose, elk, reindeer, or caribou, between the first day of September and the first day of December.

Wild turkey, grouse, pheasants or partridges, between the first day of September and the first of January. Snipe between the 15th day of August and the 1st day of May. Mallard, grey duck, black duck, wood or summer duck, and all kinds of teal, between the 15th day of August and the 1st of January.

Hares and rabbits, between the 1st day of September and the first of March. Except in the counties of Essex, Lambton and Middlesex, no quail shall be taken or killed from the passing of this Act.

No person shall have in his possession any of the above animals or birds, or any portion of them during the close seasons. They may be exposed for sale, nevertheless, for one month and no longer after such periods, or had in possession at any time for family use; but in all cases the proof of the time of killing shall be upon the party so in possession.

None of the animals or birds above mentioned shall at any time be taken by means of traps, snares, gins, baited lines, or other similar contrivances. Any person may destroy such traps, snares, etc., which he may discover without incurring any liability for so doing.

No person shall have in possession the eggs of any of the birds mentioned at any time. No batteries, snoken punts, or night lines allowed in the killing of swan, geese or ducks.

Beaver, muskrat, mink, martin, racoon, otter and fisher may be hunted and killed only between the 1st day of November and the 1st day of May.

The fine for killing deer, etc., out of season, shall not be less than ten dollars nor more than fifty dollars for each animal. For having in possession the birds or eggs of any of the birds protected, at any time, not less than five dollars for each egg. For killing any of the fur-bearing animals out of the season not less than five dollars for any other breach of the Act. In all cases the whole of the fine to be paid to the prosecutor.

Answers To Correspondents.

C. E. L., Lockport, N. Y.—Duck in season in Ontario, Canada, Aug. 15th. See this week's issue FOREST AND STREAM.

L. A. K., Boston.—Texas Jack has not yet been seen at Creedmoor. Do not know what rifle he uses.

S. S. R., New York.—Can you tell me where in New York to buy wall tents? Ans. Wellington A. Carter, 51 and 52 Courtlandt street.

H. D., Philadelphia.—We would advise you not to give your dog any medicine or interfere with him in any way, unless he gets much worse.

W. H., Ralston, Pa.—Do you know anything about the Cocker pups, advertised in your last? Ans. We believe they are genuine, but do not know the gentleman personally.

RELYUC, Albany.—What is the cost of board at Blue Mountain Lake Adirondacks, and during what months is there good fishing there? Ans. No hotel on Blue Mountain Lake. Fishing till September.

A. W., Philadelphia.—1. *Land and Water*, 169 Fleet street, London. 2. They did some years ago, but to-day English cartridges for breech-loaders are charged with about the same sized powder as ours.

C. S. R., Boston.—Who are the best guides for the Rangely region; also, am I in error in thinking that the time for trout fishing in Maine has been extended to October 15th? Ans. Guides all good. Get Charley Soule, if you can. Season ends September 15th.

J. S., Philadelphia.—What is the proper load of powder for 14 shot in a 10-bore breech-loader what size and what brand? Ans. See answers in FOREST AND STREAM July 28d. You do not state what game you propose to shoot.

C. P. W., Albany.—We have learned that the Monitor Raft for sportsmen is made by the Combination Rubber Company, 62 Church street, for the patentee's price, \$75. The bamboo rods are made by Thomas Tont, Kingston, Mass.

COLUMBIA.—Would you please give me the course of training pursued by the Columbia boat's crew, also the diet used by them for the month previous to the race? Ans. If you will write a letter to Captain Reese, Columbia College, N. Y., we think he would give you the desired information.

TROUT ON THE BRAIN.—I have about fifty dollars to spend on my vacation, which begins the 20th of August, lasting ten days. I would like to ask your advice as to where I should go to have first-rate sport in trout and lake fishing? Ans. Go to Twin Lakes, Canaan, Connecticut. Take Harlem and Conn. Western Railroad.

FRIDAY.—Is the fishing at White Lake, N. Y., good, and what kind? What are the hotels and board per week? How shall I get there, and what is the fare? Ans. Would not advise you to go to White Lake for fishing. Used to be good bass fishing, but very poor now. Get off at Coshecton, Erie Railroad, or at Monticello; White Lake House and Woolridge House. Fare, \$6 or so.

L. G. B., New Jersey.—Will you oblige me with the addresses of the most reliable parties in England from whom to obtain a Gordon or Russian setter bitch, or the name and address of sporting papers in England of whom I can obtain reliable information? Ans. Frank C. Pearce, Preston street, Faversham, Kent, England, will give you every information.

CIRCLE.—When does the open season for trout end in Maine? Ans. Season ends Sept. 15th. Where do you think would be the best place to go for two weeks' fishing the last of August; if in Maine, at what place nearest Portland? Ans. Sebectakes. Is there any shooting there in August; if so, what kind? Ans. Snipe and the like.

M. B. & Co., Springfield, Mass.—Would it be of any use to take flies into the Thousand Islands district; if so, what kind would be best? Ans. Take flies, by all means; the Page fly, scarlet wings with guinea fowl shoulders or primaries, is a most killing fly. Oswego river bass take browns of turkey wing. Any gaudy combination—scarlet and white, yellows, nondescripts of all sorts, regular calico patterns, are the best for bass. Red flannel is often a killing lure.

F. S. D., Boston.—Would you tell me of some preparation that would make sheeting waterproof, so that it could be used for a tent? Canvas makes too heavy a load to carry through the woods? Ans. Take half a pound of sugar of lead and half a pound of powdered alum, dissolve them in a bucket of rain water, then pour off the fluid with the dissolved ingredients into another vessel. Steep the canvas thoroughly in the solution, letting it stay for a considerable time. Hang it up to dry, but do not wring it. The water of a rain storm seems to hang to it in globules and does not go through it.

INQUIRER.—The whole number of improved trout ponds on Long Island is 82. They occur on both sides of the Island, from Brooklyn to Riverhead. Most of these are private, but there are several in which fishing privileges are sold to transient anglers at so much per day, or \$1.50 per pond caught. The principal ponds are at Maspeth, Little Neck, Smithtown, Northport, Huntington, Centrepont, Cold Spring, Wading River, Smithtown River, and Roslyn, on the North side, and at Riverhead, Seatuck, Belleport, Fireplace, Islip, Patchogue, Canarsie, Seaford, Amityville, Babylon, South Oyster Bay, Freeport and Hempstead, on the South side.

J. A. P., Philadelphia.—Are black flies very bad in the Umbagog and Rangely region, say from August 12th to September 1st? Ans. No flies. Is fishing good at above time on the Megalloway river, can a guide and boat be obtained, and at what point? Ans. Good fishing. Take stage from Bethel Hill, on Grand Trunk Railroad, to Upton, cross Umbagog to mouth of Megalloway, then go up stream fifteen miles to upper settlement, where you can get guide and boat. Thence there is a two mile carry, then twenty-seven miles up stream to mouth of Little Megalloway, then a carry of three miles into Parmachene Lake. You can cover as much of this ground as you please, and enjoy best of sport. Could you recommend a better place in same neighborhood for good-sized brook trout? Ans. No.

R. ROFF, Washington.—Please inform me of the difference between the horse mackerel, bluefish, salt water taylor and the snapping mackerel, also what connection the white perch has to the bass, and oblige? Ans. Well, a horse mackerel is a *thyngus* which will sometimes weigh 2,000 pounds, while of the mackerel of commerce, No. 3, it takes a good many to fill a barrel. It would require pretty strong tackle to play a horse mackerel. They are captured with harpoons. All the fish you mention are nearly allied; the bluefish and taylor are the same, and the snapping mackerel are merely young bluefish. The horse mackerel are numerous around Nantucket. The bluefish are known south of New Jersey as the taylor fish, and the snapping mackerel fill the harbors and entrances of Long Island Sound in July in countless numbers. The black bass belong to the *Percide* or spine-rayed bony family, which embraces three-fourths of the kinds that are known.

WELLSVILLE, N. Y.—In your issue of July 9th, in answer to C. S. R., Fulton, you say there is a fine of \$25 for fishing on Sunday. The law reads thus: "There shall be no hunting or shooting upon the first day of the week, called Sunday," and says nothing about fishing. The game laws in 1869 read: "There shall be no hunting, shooting, fishing, or trapping on the first day of the week, called Sunday," since which time I have never seen anything in regard to fishing on Sunday. Please tell me where I can find the Sunday law? Ans. See Laws of New York, Chap. 721, sec. 15. "There shall be no shooting, or hunting, or having in possession in the open air, the implements for shooting, on the first day of the week, called Sunday * * * under a penalty of not more than \$25 nor less than \$10, for each offence." If you wish to go fishing on Sunday there is nothing in the above text to prevent; but should you be brought before a justice he would probably, if a conscientious man, rule according to the *spirit* of the law, for our careless legislators never meant to imply by their omission that hunting was improper and that fishing was not.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, "FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INOCULATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT DOOR RECREATION AND STUDY."

PUBLISHED BY

Forest and Stream Publishing Company.

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,
[Post Office Box 2832.]
and 125 SOUTH THIRD STREET, PHILADELPHIA.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty per cent. for five copies and upwards. Any person sending us two subscriptions and Ten Dollars will receive a copy of Hallow's "Fishing Tourist," postage free.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, JULY 30, 1874.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Managing Editor.

WILLIAM C. HARRIS, Business Manager.

CALENDAR OF EVENTS FOR THE CURRENT WEEK.

FRIDAY, July 31st.—Northern Ohio Fair Association, Cleveland, Ohio—Westchester county fair grounds, near White Plains, N. Y.—Boston vs. Athletic B. B. C. at Manchester, Eng.

SATURDAY, August 1st.—Saratoga running meeting, Saratoga, N. Y.—Westchester county fair grounds, near White Plains, N. Y.—Practice day Harlem boat clubs, Harlem, N. Y.—Athletic vs. Boston B. B. C. at Sheffield, Eng.

MONDAY, August 3d.—The English twelve of 1872 vs. Eighteen of America, at Prince's Grounds, London, Eng.

TUESDAY, August 4th.—Saratoga running meeting, Saratoga, N. Y.—Buffalo Park, Buffalo, N. Y.—Buckeye Shooting Club, Cleveland, Ohio Trotting at Lawrence, Mass.

WEDNESDAY, August 5th.—Buffalo Park, Buffalo, N. Y.—Match day Hoboken cricket grounds, foot of Ninth street—Buckeye Shooting Club, Cleveland, Ohio—Trotting at Lawrence, Mass.

THURSDAY, August 6th.—Buffalo Park, Buffalo, N. Y.—Open regatta at Oakland beach, Lear Providence, R. I.—Buckeye Shooting Club, Cleveland, Ohio—Trotting at Lawrence, Mass.—Prince's club eleven with professionals vs. Eighteen of America, at Prince's grounds, London, Eng.

HOW TO PLAY CROQUET.

ALMOST every reader thinks that it is simple enough, and that one who does not know how to play croquet must be an old fogey, or the inhabitant of some foreign isle; and yet we venture to assert that this same game is not played correctly—according to any one published and consistent code of rules—on one ground in a dozen throughout the country. This is all wrong, and is enough to have killed any game less meritorious than croquet. For the best interests of the game there should be one uniform set of rules adopted by some recognized authority for the whole country, and this has been the aim of many lovers of the game for years; but thus far they have failed to realize their hopes.

It at first seemed a simple matter to call a Croquet Congress, who should adopt national laws for the game, but the details of such a convention were not so easily arranged, because from the social nature of the game the regularly organized clubs were very limited in number, and hence there was no basis for authorized representation. In the absence of any established authority it becomes the duty of the owners of every ground, or of the company usually playing on it, to adopt some published laws of the game, which shall be strictly observed by every player on the ground. If any amendment or change is desired in any code of laws which for the most part are acceptable, let such change be written out fully and inserted in its proper place, and all conflicting rules stricken out, and

if any point of difference arises that cannot be decided by the rules as adopted, let the majority of the regular frequenters of the ground decide it once for all time, and have it entered in the rules. But we hear some one say, "this is making a very serious matter out of a subject only intended for a little recreation." Others say, "we do not believe in surrounding this simple game with such strict rules, and so many of them that no person of ordinary ability can learn them."

But to any one accustomed to such exhibitions of temper and ill feeling as are constantly occurring on croquet grounds in consequence of the want of some definite authority to settle disputed points at once when a question arises, the matter assumes a serious aspect. Further, it does not in the least simplify a game to attempt to play it by a few simple and general rules, because in a game as susceptible of scientific playing, as is croquet, many fine points must arise demanding settlement by some definite authority. Therefore, we repeat the advice, to be sure and have it understood by all the players what rules shall govern their playing. When it comes to the selection of the authority, of course great difference of opinion will be developed, and we wish here to advocate a few points which we believe tend to add largely to the interest of the game.

In nearly all of the manuals the BOOBY is a recognized feature. A ball missing the first bridge is declared a booby, and some special rules are given regulating the disposition of such a ball and the playing of other balls in connection with it. In some authorities the booby is not recognized; and why should it be? Why should the failure to make the first bridge confer a favor or inflict a penalty on a player any more than missing any other bridge in the grand round? There seems to be no good reason for this formerly almost universal complication of the game. Hence we suggest the immediate abandonment of all recognition of a booby, thus treating a ball as fully in the play after the first stroke.

The question of restricting the use of the roquet croquet, or loose croquet to the rover, was a much discussed one a few years ago, but the Americans were not willing to yield to English authority in such a restriction of this, the most scientific stroke of the whole game, and at the present time the roquet croquet is allowed to all players on nearly every ground in this country. But still many of the published rules either restrict its use (being originally copied from the English), or else, in answer to the popular demand, they have changed this rule, but have left others that were originally based on the former custom.

One of these cases is in the treatment of a finch. Formerly, when the tight croquet only was allowable, of course some penalty was necessary for a finch, which was nothing more nor less than an accidental loose croquet. But now, where the loose croquet is allowed, why put a penalty on a stroke combining the two allowed strokes? *i. e.*, the combination of the tight croquet with the roquet croquet.

To ignore the finch and all of its penalties again simplifies the game as much, perhaps, as the abolishment of the booby, and both seem to be superfluous complications. In these suggestions we have not exhausted the questions liable to great difference of opinion, but simply mentioned a few of the most important. But we again say that the most important matter is, to adopt fully some consistent set of rules, and stick to them in the smallest particulars. Above all things, play honestly, and keep your temper. We believe no one is justified in losing his temper except upon the discovery of an attempt to cheat on the part of another player. In such case any one is fully justified in refusing to play another game with that person. It may by some be considered shrewd to cheat in business, but we believe all will allow it to be the height of *meanness* to cheat in a friendly game.

TOUCHING SOFT CRABS.

HE was the king of the Soft Crabbers, and we caught him just between two tides at Fulton Market, and he told us all about it. "You see," said Mr. Herbert, a fine looking Jerseyman, with the hale of the sea on his face, "soft crabs put in with a good deal of regularity from about the 24th of May to say the 5th or 6th of June, and keep on up to the 1st of October, sometimes as late as the 10th. We catch them principally on Squan River, from the mouth five miles up as far as Wide River. There must be fully 100 men engaged in the business. We use a hand bow net, about twelve inches across and some eight inches deep. The crabber sees the crab and just scoops him in. In order to get him you wade in half knee deep. Crabs mostly swim on the bottom in the shallows in clear water, though they like to congregate and hold caucuses-like, round bunches of grass, an old bush, or a piece of sodden wood. It requires a good deal of skill to fetch them up, and it's an extra lucky day on which a party gets as many as 200 crabs. A full moon in the months of June, July, and August is about the best time for crabbing. It isn't true that thunder storms kill them; that's a yarn; but after you have caught them, thunder will just destroy them. It is generally single fishing, though two men go partners sometimes. A good hand can make \$1 50 a day at it. I don't think they have diminished at all in quantity; I even think there are more soft crabs now, at least in Squan River, than there used to be. A mighty big soft crab will measure eight inches across the tips of the shell. There is a bit of science in catching soft crabs. Now you might go along shore, sir, and scoop up a crab, and, going only for soft crabs, drop him because you thought he was hard. That's just where the skill comes in, you see, and the

knowledge of the business. A man as is a soft crabber, can tell a shedder just as soon as he claps eyes on him under water, and goes for him. When a crab commences to shell, we call him a "burster;" just at that time he seems fat, and then he backs out of his shell. Twenty-four hours after changing himself we call him a "buckler." In this condition he is too soft for transportation, and is kind of watery, and wouldn't make good eating. In about eight to ten hours his shell hardens a little and ripens. We say the crabs *temper*. Then we pack 150 or so in a box and ship them to market. Now, taking advantage of this, a crabber as is a crabber, when he can, catches his crabs before they have cast their shells, puts them in his pound or car, and just waits for them to get ready for business. They will keep soft when out of water for quite a long time, for they can't make any shell. Some people are so funny and ignorant-like; for how could a crab make extra shell by just living in the air? If you put him back in the water, in six hours he gets his back up, and isn't good any longer for a soft crab. About the last run of crabs are always females. You can tell the difference plain enough. On the belly there is a kind of strap, that goes up there like an old fashioned pocket book strap. We call it the apron. When it is broad at the bottom, and tapers up, that shows it to be a she crab, and when it is narrow, and all about the same width, it belongs to a he crab. When you pick up a soft crab to look at him and see if he is good, you are apt to take him by his biters or claws. If you do that you are likely to lose him, for he is smart enough to just drop both claws at once—just fling them off; not only the one you have hold of, but the other that you ain't touching. We don't catch hard crabs at all, for the reason that fishermen kind of know that crabs breed when they are hard, and that would be killing the chances of a good soft crab crop in the season. The demand is always large, and New York takes all we can find. The places in New Jersey that run most on crabbing are Squan village, Point Pleasant, and Herbert's mill."

THE NATIONAL CONVENTION.

THE project and call for a National Convention to revise the game laws is receiving increased attention, and we trust that any movement to accomplish the ends desired will receive attention. We copy a few extracts from letters.

CENTRAL NEW YORK, July 18th, 1874.

EDITOR FOREST AND STREAM:—

Permit one of your readers to express most fully his warm endorsement of the plan advanced by your paper for the formation of a Protective Association for guarding game birds, fish and animals, and the "forests and streams" that give them birth and shelter. I remember with pleasure the reception the idea of a National Convention (one more than National, indeed, as it seeks the co-operation of the excellent Canadian sportsmen), met with at the February meeting of the American Fish Culturists' Association, and I feel full confidence that the importance of the work to be done will be seen as it is now carefully contemplated.

I can also see good in forming an association in addition to the present State Sportsmen's Association, one in no way a rival, or in any degree antagonistic, but one that will bring new forces into the field in reinforcement to the present array.

It has been truly said that the various religious sects are of great value, as their varied forms meet and satisfy the various tastes and ideas of minds that are seeking the same elevating end, and it is beyond doubt that the general united power of all for good far exceeds that which could have been encompassed by the creeds and tenets of any one denomination.

And without in any way claiming to class the movements we now favor with the aims of the churches, we may borrow, from the harmonious example of their successful working, hints of infinite value; none of more importance than the one that shows how kindly and generous people can, with due deference to views conflicting in minor points, carry on movements which all unite to forward and support.

I am not excited nor amused by hours of trap-shooting. I would fain get the sportsmen assembled for earnest and patient consultation, aided by men of experience and of scientific attainment, to study the mysteries of nature where her works are carried on as they were thousands of years ago when no hand had intruded rudely in her workshops, and to learn how best the wildwood may be kept a wildwood, and how its generous offerings of bright-hued fish and agile game may be kept to reward in *due season* the adventurous and brave that fortune ever favors.

Many keen sportsmen feel with me. The love they have for the chase is born from the difficulties that render it so constantly a demand upon our utmost skill, boldness and patience. They will not take any unfair advantage. Before their rifles the tame deer of midsummer are safe, and the most tempting fish will not find danger from their cast. So far does this impulse of fair play go that they are unwilling to shoot at a bird that has the small chance of a long-confined pigeon cast from a trap, and yet they are not in any way disposed to be critical with regard to those who increase their skill and find amusement in such shooting. Many who are faithful in daily attendance at pigeon-shooting trials have the most honorable sporting ideas, and can bring to the counsel the experience gained from many camps, and they will meet most warmly the sportsmen who will respond to your call, and most fully respect and appreciate the feelings that influence in meeting for purposes other than trials of skill and competition for prizes. Feeling thus, I am confident that there is full field for two organizations in this State; and they need not be antagonistic, but, on the contrary, should each forward the great purpose of protecting game.

There is great need of more force in this matter. While the guns were firing in Oswego, deer were being shot for their skins in the woods about Bog River and Cranberry Lake. One party is said to have killed thirty last season, and I hear of another party that found the bodies of deer piled up to decay, and understood that fourteen were

slaughtered by one gang. The hides of deer killed in the spring bring a few cents more per pound, and men there are who would kill a doe and suckling fawn for the smallest price.

These facts are well known among the manly guides of St. Lawrence County, but they, in their lonely lives, do not wish to incur personal enmity of a savage character by informing or prosecuting, deeply as their hunting is thus injured. A strong, organized power is needed, backed by honest men, furnished with means, and aided by fair and fearless legislation. They must not threaten, but punish; not compromise but enforce full penalties, and not only do defense of game in the woodland, but on the tables of epicures, permitting no law of hospitality to excuse defiance to the laws of nature.

The movement needs the aid of all, and if a new organization will rally a class of influential men who are not tempted out by the attractions held out by associations now existing, no one should object to an additional one, that men of different tastes may reach one end and work out one common cause for mutual benefit.

Your correspondent is confident that a new organization will be useful, and not diminish the value of any. One that will bring from retirement men of great scientific skill, naturalists and close observers; men who have advanced the knowledge of the times and seasons of game, and those who have done such infinite service in multiplying our fish so wonderfully. Those, too, will respond, who, in the interests of manufactures and navigation, feel the importance of forest fed streams and renewed supplies of timber, and the intelligent farmers, who are more than ever ready to influence legislation favoring forest culture.

Let various forms of appeal get to all classes, and there will be but little time before new interests are awakened and new influences gained.

The movement deserves success, and will win it, and few questions will claim more general interest than those that will develop in Field and Forest law.

Yours truly,

WOODS.

"L. W. L." writes from Cazenovia to the Syracuse *Courier* warmly advocating the promotion of a new Game Protective Society in this State, "not rival nor in any way antagonistic to any other society, but one that will hold meetings for the one single purpose of learning how best to promote nature's free gift of fish and game." He says:—

"Such an association is the American Fish Culturists' Association. Their meetings are made of infinite interest by the presence of men from all parts of the Union, and from the Canadas, and no lack of enjoyment is felt that trout or grayling are not brought in tanks from Michigan, and fastened on to hooks, leaving the fisherman to show his skill or lack of it by landing or losing the fish thus placed at his command without any exercise on his part of woodcraft, or courage or endurance."

In reply to this letter another correspondent in same paper endorses the views expressed in the following words:—

"It embodies sentiments that every true sportsman will appreciate, and I trust an army of men whose ideas are fully up to his, will assemble in New York upon the call of the 'Fish Culturists' Association,' and form an organization."

Our Missouri correspondent supplements his letter of last week with the following note:—

HANNIBAL, Mo., July 18th.

EDITOR FOREST AND STREAM:—

In my letter of last week respecting National Convention, I wished to be understood to say that I believe it would have been more satisfactory to the sportsmen of the country had the New York State Association indorsed or adopted the call issued by the New York City Association, as that call leaves the date and place of meeting to be discussed and decided upon by the sportsmen at large, and expresses a willingness to be governed by the will of the majority, and does *not*, as is the case with the State Association, assume to name the time and place. I would be much pleased to see success attend the effort, but must confess that I see little hope that the State call will meet with success, especially as there seems to be a want of harmony existing in regard to it between the sportsmen of the State in which the call was made.

The sportsmen of the west are not so well organized as those of New York, and require more time to prepare for a meeting, on the action of which so much may depend, and it would be folly for a few sportsmen from various parts of a State to attend such a convention without instructions and without conference together, so as to insure concert of action.

G. W. D.

PROFESSOR HUXLEY—WILL HE COME?—The death of Agassiz left a void which is certainly hard to fill. The trite expression used in regard to monarchies or their representatives (more true theoretically than practically), that "the king is dead—long live the king," hardly applies to those who govern the realms of science. Few men in this world could assume the position which Agassiz so well occupied. We see it noised about in this country (we are inclined to think without much authority) that Professor Huxley is likely to be the successor of Agassiz at Harvard. A reflection of this news comes from the other side. *Nature* asks, "Are the English universities so poor in money that they can or must allow Professor Huxley to go to America in order to find leisure for work? It would require nothing but the will for either Oxford or Cambridge to offer Huxley two or three thousand a year without any way suffering from it."

Without being in the least desirous of begging England of one of its richest prizes, we must say that we would only be too glad if we could have the borrowing of Professor Huxley for a limited period. Professor Tyndall's visit to this country did something more than simply give our people an idea of what careful study meant—it impressed on them the necessity of securing among us some of the leading minds of the world and freeing them from the pedagogic trammels of teaching, to allow them, with ample means at their disposal, to work at their leisure in the more hidden mines of scientific wealth.

Flattering, then, as may be even the rumor that Mr. Huxley is to come to us, we are inclined to think that our hope is simply the father of the thought; but what we have to add is that no man in this world is fitter to follow in the footsteps of Agassiz than is Huxley.

THE NOANK NAIAD.—At last the crowning glory of our collection has come to hand. The Comanche scalp may shake his gory locks in vain, the aboriginal skeleton may rattle his bones unheeded, the fin of the Megalops, the sword of the sword fish, the curious antlers, the hyperborean snow shoes, the pelts and skins of strange animals, which decorate our halls, have now, figuratively, had their day, for the Noank mermaid (vulgaris), or *Gullops Piscocensis* (scientific), has eclipsed and thrown them in the shade. This wonderful ichthyogical specimen, which it took the entire corps of the United States Fish Commissioners at Noank to obtain, and which was not finally captured until the steamer "Bluebird," with all steam up, was hitched to the line, has arrived in New York. As it is against scientific ethics for the finder to name any newly discovered fish or comet after himself, we fully appreciate the courtesy which delegates to us giving a title to this marvellous Noank fish. After mature deliberation we have christened it the "Noank Naiad." Should we ever drop the pen, and take to other realms of usefulness, as, for instance, that of *impressario* of a travelling show, the Noank Naiad will be our great card. Great minds must have their relaxations at times, and a little bit of a lark, or a funny fish, when prepared by the Noank party, is fully appreciated by the FOREST AND STREAM. The specimen sent is wonderfully attractive, and no less than fifty people have already inquired about its name, some of them leading fish culturists, and we have been asked whether we thought "eggs could be procured for propagation in fish ponds, as the fish would be so pretty."

INTERESTING TO ALDERMEN.—A very reliable correspondent at Warrington, Escambia County, Florida, (an officer at the Pensacola Navy Yard,) sends us clippings from the local papers relating to the capture of a monster sea-turtle outside the bar. We quote from the Pensacola *Republican* of 27th June:—

"On Thursday, as the steam tug C. C. Keyser was coming up, Captain Fauria discovered a battle progressing between an immense turtle and three or four sharks. Capt. F., with his crew, took a hand in, and effected the capture of the turtle and brought it to this city. His turtleship measured 6 feet 6 inches in length; 6 feet 7 inches from tip to tip of flippers, and 3 feet 4 inches across the breast. Its weight was *twelve hundred pounds*."

Our correspondent remarks:—"I had not the opportunity of seeing him, but a boatman friend of mine assured me that he would weigh as much as represented, and an experienced fisherman, captain and owner of a fishing smack, told me that he has seen them lying asleep upon the water of size sufficient to weigh a ton. It was what the fishermen call a "ridge back," from rows of spiky protuberances fore and aft its back. The boatman, who saw him carried to Pensacola, homorously informed me that a prominent mill-owner in the city had bought the back shell to lighter off lumber from his mill to the shipping in the bay."

THE INDIAN WAR.—We are indebted to Captain Sander-son, Fort Sill, Indian Territory, for large photographs of Kiowa, Comanche and Wichita Indian girls, in full panoply of paint, blankets and natural adornment. Our attention is called to the marked difference between the abashed, half-frightened look and simple dress of the wild Comanches, and the more than gross belongings of the Wichitas, who have become depraved by contact with civilized white men.

The Captain also sends us a series of articles upon the domestic and roving life of the Comanches, the first of which we shall publish at earliest convenience.

Through the same correspondent, whose letter is dated July 11th, we gather the following items of interest concerning the Indian war now rapidly developing, it is feared, to formidable proportions:—

"These Comanche letters referred to above, may have more interest now than at any other time, for my friends are off on the war path in earnest. A regular confederation has been entered into between Comanches, Kiowas and Cheyennes, and probably some Osages. Already they have killed some twelve or fifteen people near the Reservation and a painful rumor now comes of a whole settlement on Medicine Lodge Creek, of thirty-one men, women and children being massacred. It needs confirmation, and we all hope may prove untrue; still there is no doubt of a general Indian war on the part of these Indians, the Arrapahoes being the only large tribe not disaffected as yet, though an unwise course might send them also.

Of the Chiefs mentioned in my letter, Tosa-weeth, Essahabet, Assa-to-yet, Horse Back, and Quirly Quip are the only ones here and friendly, and the most of Horse Back's and Quip's followers have joined in the war. It is a sad state of affairs, without the shadow of an excuse, and is the natural result of a totally inefficient and ignorant treatment of a subject that is a shame and disgrace to our people."

SHOE PACKS AND MOCCASINS.—One of our advertisers sends us the following appreciative testimony of the value of our journal as an advertising medium. We acknowledge the courtesy conveyed in his note, and also the receipt of the shoe packs, both of which, we are pleased to say, fit us exactly. The shoe pack No. 2, is not to our liking, however. It is merely a waterproof brogan or laced boot, whose utility would be confined to slushy or muddy roads, or marsh, where the foot did not sink deeper than the instep. For ordinary use we prefer an ordinary laced boot. Mr. Good has two other varieties, however, either of which

are vastly preferable and are modeled from the Canadian shoe pack; they are made with either full tops or half tops, and have a pliable waterproof foot, without laces, easy to wear and much like a leather stocking. With a broad sole of one thickness of sole leather, to protect the bottom of the feet on stony or stubby ground, and to ensure durability, we should prefer them to the genuine beef skin of of the Kanucks:—

EDITOR FOREST AND STREAM:—

After a much longer delay than I anticipated I send you to-day by express a pair of the No. 2 Sportsmen's shoes, of which I beg your acceptance, and hope they will prove satisfactory. The delay has been caused partly by the excellence of your paper as an advertising medium, having received orders from nearly every State of the Union faster than I anticipated or was prepared for.

Allow me to say I am very much pleased with the FOREST AND STREAM and consider it indispensable to every sportsman. FRANK GOOD.

THE TRAVELERS.—Gentlemen are referred to the advertisement of the old and reliable 'Travelers' Insurance Company, of Hartford, the pioneer in the system of insuring against accidents, and one of the most stable and successful of the younger life companies. In the course of ten years' business, insuring men of various occupations against the general accidents of daily life, it has paid over twenty thousand claims, disbursing two million dollars in direct benefits to policy holders. The company has assets of nearly \$3,000,000, and is sound and well managed.

Sporting News from Abroad.

[FROM OUR SPECIAL CORRESPONDENT.]

THE latest excitement has been contributed to the sensation-loving public by the fertile pen of Mr. G. A. Sala, who, as special correspondent of the *Daily Telegraph*, is ever on the watch for the opportunity of making a successful hit, which may afterwards prove the basis of two or three lucid leaders. Wandering about the "black country" in the Staffordshire districts, he got into the company of some of the miners and pitmen, who turn their high wages, obtained by periodical strikes, into those channels of pleasure which end in coarse brutality. The scene of action was a coal cellar far from the cognisance of the lads in blue, who might have put in a disagreeable appearance, and on this occasion the *piece de resistance* of the evening was a fight between a man and a bull dog. There is, however, nothing new under the sun, and although the spectators probably thought they were witnessing something entirely fresh, yet the same thing was done by the notorious Jack Myton, who used to drive his tandems, cart and all, over turnpike gates at least fifty years ago. There was also the negro, who used to wrap a coat round his arm and present it to the most ferocious dogs, and when they had seized it was accustomed to grip their noses so savagely between his teeth, that they were often ready to beat a retreat when he released them. Taking up the thread of the discourse, we have also a monkey, who, when matched against the fiercest of the canine species, armed only with a ruler, used to vault lightly on to their backs, and methodically proceed to whack them heavily over the head till life was extinct. Of course, the "*D. T.*," as the paper is called, enlarges on the inhumanity of the proceedings, for the man and dog were both chained to the ring, and the battle was not of the milk-and-water order. But, joking apart, though the man did beat the dog off with his fists, it might have been a serious matter. Perhaps there is some truth in the story of the dutiful son, who, when the bulldog pug seized his ancient parent by the nose, cried out excitedly: "You maun'a pull the poop off, father; let 'un taste bluid, 't will be the makin' on 'nn."

The Manchester dog show, though not of the grand dimensions which the Crystal Palace boasted, was a very good one as far as quality went, and the north country men excel in terriers, the black and tans with cut ears and whip tails being about the best which England could produce. Unfortunately the Lancashire people do not think anything of tampering with, or as a more slangy parlance elegantly phrases it, "faking" their dogs, but in order to make tan markings appear more bright, or (in the fox-terrier class) the ears to drop more neatly, without the least compunction, though it amounts to a direct fraud, they convert with caustic a pink nose into a black one, or file down teeth, and rosin dog's sterns. Mr. Price, who judged the toys, was of course scarcely on the look out for these malpractices, but immediately after the judging no less than three of the prize winners were disqualified, for being painted, the proper test having been applied by a veterinary surgeon. A new feature in the day's entertainment was the lecture given by Mr. Fleming on Hydrophobia, many owners and breeders of celebrated prize dogs occupying the platform. Mr. Fleming has written a book on the disease, pronounced by the *Field* to be the best published, but on this occasion I failed to detect any large amount of originality in his discourse, and indeed he seemed to me to advocate precisely the same precautions when bitten as I myself advised in a late article in this paper. A reward of £500 has been offered for the best essay on the subject, but the conditions of the competition are not yet forthcoming.

The Wimbledon meeting has had some hot weather to contend against, but that is better than rain. The Lords and Commons match was won by the latter, the conditions being 15 shots at 500 yards. Five men on each side. The Lords were: Marquis of Lorne, 65; Earl Waldegrave, 63; Earl Ducie, 57; Earl Grey, 36; Lord Gifford, V. C., 40; the total score being 261. The Commons included Hon. R. Plunkett, 69; Mr. D. Fordyce, 69; Mr. Malcolm, 65;

Mr. A. P. Vivian, 65; Mr. A. Bass, 69; total, 337. Next week there comes off the Elcho Challenge Shield and the Public School matches, which I will refer to. Curiously enough, a sheep was found dead, which everybody denied having killed, but a Rigby bullet found in it was identified as that of one of the best shots on the ground.

IDSTONE, JR.

Shot Gun and Rifle.

GAME IN SEASON FOR AUGUST.

Woodcock, *philohela minor*. Squirrels,
Pinnated grouse, *cupidoria cupido*. Snipe and Bay Birds.

Pinnated grouse, or "prairie chickens," are in season in Kansas, Nebraska, and Minnesota, August 1st; in Michigan, August 5th; in Missouri, Illinois, Indiana and Ohio, August 15th; Wisconsin, August 20th; Iowa, August 22d; in Maine, New Hampshire, Massachusetts, New York, New Jersey and Pennsylvania, September 1st, and in Connecticut and Kentucky, October 1st.

Details of pigeon shooting and scores of rifle matches, and other interesting matter, should be mailed so as to reach this office on Tuesday morning in each week.

—The Bay snipe are up. A letter from Cape May, dated the 26th, says: "The Bay snipe are coming slowly. Last Monday, the 20th, Mr. Gambrell of Baltimore and his guide, Aaron Schellinger, killed 100 birds on one tide, mostly yellow legs and red-breasted snipe. I tried them the next day, but as it rained all day, and very little wind, we did not get many birds, although I had the best guide and shot on the Island, Caleb Warner. He killed a curlew at sixty-five paces with my twelve bore Toulou's breech-loader, with three-drachms powder and one ounce No. 10 shot. My Clark-Sneider altered gun shoots remarkably well; and I think it as good as a new one."

—A correspondent writes from Barnegat, July 27th:—

"Birds in quite good flocks are making their appearance. I saw forty curlew on Monday, and 200 or more snipe on Wednesday near Beach Haven. One gunner had some twenty snipe, and another forty on Saturday. Gunning will be better after the 10th or 15th of August. Birds have made their appearance very early this season, but as yet seem mostly on the move, flying about from place to place in search of good quarters."

—In the markets woodcock are found in about the same quantity and at the same prices as last quoted: say, \$1 to \$1.50 a pair. The bulk of the birds come from the west. Last week some 670 cocks came from Henry County, Ill. Very few birds are arriving from Long Island and New Jersey. We should say arrivals do not exceed 1,500 birds a week. Philadelphia and Boston are getting their birds from New York. A good many willets, yellow legs, dowitchers and curlews in market from the Jersey shore, and there has been good bay shooting around Sandy Hook.

—Below we give a summary of the reports we have received from various sections since the opening of the woodcock season. The number of woodcock killed indicates that the birds have not been as numerous as in previous years. In fact from every quarter the invariable testimony, "birds very scarce," accompanies each report. In some places which were noted in former years for their abundance, very few have been found, and in others none at all. In the Patterson swamp, near Carmel, Putnam county, this State, always famous shooting ground at this season, the birds were by no means as numerous as during last season or previous ones, though in greater quantity than in any other place we have yet heard of. With four guns and three dogs sixty-four were killed. With one gun and a brace of setters and a brace of pointers, worked alternately for six days, the average was eighteen birds a day. On the drowned lands of the Wallkill, near Warwick, Orange Co., N. J., covering a vast extent of territory, the most noted resort for woodcock in this section of the country, they are generally found in large numbers and the bags correspondingly large. There being an excellent tavern at Pine Island, kept by the Carling Bros., who are first class shots, (as was their father before them) and owners, it is supposed, of dogs direct descendants of the celebrated Webster setters, many sportsmen resort there. But this year, like every other place, those that went there with large expectations were doomed to disappointment. On the 3d, 4th, 6th and 7th there were forty guns and from fifteen to twenty brace of dogs. The largest bag was fifteen.

In some places many of the clubs after the first day abandoned their hunt. The Mohawk Game Club of West Troy, who have an annual camp and hunt near Westboro, back of the Hilderburgh Mountains, gave it up after two days' trial, having found only ten birds, bagging nine of them. As a usual thing woodcock are found in large numbers in this section, it being quite a favorite breeding place for them and the hunt there invariably results in large bags. But this year the reports were so discouraging that only five of the club participated, and the result showed the truthfulness of the report. On the Westbrook Meadows, in Pike county, Pa., which are just on the confines of Blooming Grove Park, and long known as a capital ground for July woodcock, both grass and side-hill were worked over thoroughly without raising a feather.

There can be no other reason assigned for the universal scarcity than the occurrence of the killing snow storm in May last, which must have prevented the hatching of eggs on which the birds were then sitting, and destroyed such fledglings as were already out of the shell, for previous to this, the old ones were seen in larger numbers, and much earlier than usual. This theory is borne out by the fact that the majority of those killed are old ones. And so, those sportsmen who have indulged in July woodcock-shooting have been unwittingly destroying the source of supply. There

being no production, we who have banqueted, have been consuming the seed corn. Next year promises a dearth, with a long continued period of restriction and close season to follow. It is upon such events and contingencies, that we deprecate July woodcock shooting. By deferring the sport till September we give the birds a chance to hatch out a second brood, which they almost invariably do when the first have been destroyed; and by that time the old ones have moulted and fattened, and the young ones have become strong of wing, and the sportsman who counts his coops will find a legitimate and natural proportion of young birds to old ones, and may shoot right and left with a clear conscience and a consciousness of honorable dealing.

So far as we have been able to investigate, the total number of birds killed this season thus far is 1,343. Here is a partial record:—

Piermont, N. Y.—Wm. F. Steel, on the 4th, 5.
Sufferns, N. Y.—David Decker, on the 4th, 6.
Watertown, N. Y.—Three members of the Jefferson Sportsmen's Club, on the 4th, 8.
Pittsfield, Mass.—T. Eddy and friend, on the 4th, 9.
Albany and Troy, N. Y.—Messrs. Truax and Knickerbocker, Albany; and Smith and Fursman, Troy, on the 4th, 10.
West Troy, N. Y.—Five members Mohawk Game Club, on the 4th, 9; Messrs J. Scholan and Wood, on the 4th, 3-12.
Mount Morris, N. Y.—Three gentlemen on the 3d, 12; 2 gentlemen on the 4th, 5-17.
Perry, N. Y.—A party of 4 on the 4th, 14; a party of three on the 7th, 5-19.
Dawville, N. Y.—A party of 4 on the 4th, 15; 2 on the 9th, 4-19.
China, N. Y.—A party of 3 on the 4th, 12; same party on 8th, 8-20.
Ravenna, Ohio.—A party of 3 on the 4th, 11; another party of 2 on the 4th, 9-20.
Dayton, Ohio.—Mr. Simms and two friends on the 4th, 9; Mr. Wilson and Williams on the 4th, 12-21.
Hawlen, N. Y.—Messrs. Asten and Bassford, on the 4th, in Westchester county, 23.
Cincinnati, Ohio.—Our correspondent "Snap Shot" mentions as killed by a party of 5 on the 4th, 25.
Columbus, Ohio.—"Breach Loader" informs us of a bag by a party of 4 on the 4th of 25.
Goldenham, N. Y.—Dr. Howard and Mr. Brewster, on the 3d and 4th, 21; Messrs. Sears and Waltie, 11th, 4-25.
Springfield, Mass.—A correspondent signing himself "A" tells of having killed near Springfield by a party of 6, on the 4th, 31.
Woster, Ohio.—Correspondent mentions as killed by a party of 8 on the 13th, 35.
Niagara Falls, N. Y.—Four members of the Niagara Falls Shooting Club shot, on the 4th, 39.
Seneca Falls, N. Y.—Four members of the Phoenix Club shot, on the 4th, 46.
Bath, N. Y.—A party of 12 was formed and divided up into squads of four and hunted on the 4th. 1st killed 21; 2d, 14; 3d, 10; 4th, 5—total, 50.
Penn Yan, N. Y.—From here we have a report of a party of 15 who had, at the end of the day of the 4th, killed 52.
Gloversville, N. Y.—There were on the 4th, to nine guns, bagged 52.
Morristown, N. J.—Messrs. Quimby, Whiting and Brooks shot on the 4th, 12; Bryce, same day, 10; Mr. Quimby, on the 5th, 17; Mr. Bryce and friend, same day, 11; Master R. H. McCurdy, 2; total, 52.
Rochester, N. Y.—Twelve members of the Audubon Club shot, on the 3d and 4th, 60.
Newton, N. J.—A party of eleven, including the veteran, Horace Smith, and our correspondent "Homo" shot, on the 4th, 53.
Syracuse, N. Y.—Some ten to twelve members of the Onondaga Club shot, on the 4th, 75.
Lockport, N. Y.—Eight members of the Lockport Shooting Club shot, on the 4th, 102.
Patterson Swamp, N. Y.—A party of four in three days, 64; a gentleman working alternately a brace of setters with a brace of pointers, in six days, 108; total, 172.
Warwick, N. J.—On the drowned lands of the Wallkill, near Warwick, Orange county, N. J., 40 guns, on the 3d, 4th, 6th, 7th, with from 15 to 20 brace of dogs, bagged about 210.

—We print the following letter from a well known sportsman:

GREAT BARRINGTON, Mass., July 20th, 1874.

EDITOR FOREST AND STREAM:—

I have been out shooting but once. Two friends and myself made a bag of 16 cock, which hardly affords sport sufficient to pay for tramping over as much ground as we did, as we traveled over enough to have killed three times the number. With the exception of four they were all old birds. We found them on the hillsides. Almost every day lately we have had heavy showers, which have tended to scatter what few there are. In our tramp we found numerous covies of young ruffed grouse.

Yours truly,

C. H. SAGE.

—We wish to acknowledge on behalf of our readers an instance of most generous courtesy extended to them through our correspondent "Herbert," of Hannibal, Missouri, who has offered to pay the expenses of three gentlemen from St. Louis to Kansas and return on a trip after pinnated grouse. The invitation was extended to us personally, and to friends whom we could recommend, the start to take place from St. Louis on the 30th instant—dogs, wagons, drivers, tents, and provisions to be provided on the ground. Unfortunately the invitation came too late for public notice in our last issue, or we feel certain that some of our Eastern readers would have been glad to accept it. This is but a repetition of frequent similar courtesies extended to us by our Western friends, offering the most generous hospitality, some of which our readers are cognizant of. We wish our "down easters" to make a note of this. There ought to be a cordial reciprocity of good-fellowship between these two great sections, and a personal intercourse. We look upon these overtures from the West as pleasantly significant of good intent, and a desire for better acquaintance. The Western man does nothing by halves. His hospitality is as broad as his own broad prairies. His invitation includes everybody who can command or deserve his confidence, and when he makes up his mind that he can safely and properly offer his hand, he expects a good warm grip in return. We of the East are generous enough to our own limited circle of intimates, but beyond its periphery suspicion extends, and we warily scrutinize all who approach. Our dense population and experience have taught us caution in these matters, which we may be excused for. But as between ourselves and the sportsmen of the West—we to whom outdoor life and study of natural objects have given enlarged views and a just appreciation of the really good qualities that are innate in men—there ought to be a fraternity of spirit and community of interests that will not only ensure reciprocity in social amenities, but co-operation in all measures that shall promote the important interests which we as sportsmen and conservators of game should have always at heart.

—The Winkle Club of Lawrence, Kansas, has just been organized, and the following note has been sent us by its Secretary. From what we personally know of the composition of its members, it must prove a most efficient organization and extremely useful, in view of the fact that Kansas is the nearest accessible first class shooting ground we have. Now, gentlemen, please change your close season for pinnated grouse (chickens,) from 1st August to 15th August, as soon as possible. The birds ought to be protected until the 15th, at which date the shooting season begins in the adjoining State of Missouri. Nevertheless, indulgent as the law is as to the close season, we learn with disgust that young birds have been shot for three weeks past. How it did delight us when we heard that four persons in St. Joseph, just across the river, had been fined \$20 each for having these birds in their possession, and that others in St. Louis had been fined \$60 each! And to think of it, one of these unconscionable sinners has had the effrontery to appeal and carry the case up!

Our Missouri friends are certainly doing a noble work, well worthy of emulation by sportsmen of other States, and we pray that they may continue earnest unto the end. Never before has there been manifest such an earnest and wide spread interest in the protection of game as now, and such determination to see the laws enforced. All this augurs well for the future.

This is what our new coadjutors of the Winkle have to remark—and "their language is plain!"

LAWRENCE, Kan., July 20th, 1874.

EDITOR FOREST AND STREAM:—

I take pleasure in informing you that at a meeting held in this place July 7th, it was resolved to organize a club under the name and title of "The Winkle Club of Lawrence," having for its object the following purposes, as taken from the articles of the association:

The purposes for which this club is organized are the passage of such laws as are necessary to the preservation of game throughout the State, the enforcement of all laws and ordinances against the illegal killing, taking, or selling thereof, and for general co-operation with other clubs throughout the United States in all matters tending to the better protection of game and the advancement of the interests of sportsmen generally.

The following named gentlemen were elected officers for the ensuing year:

E. D. Thompson, president; W. A. Harris, vice-president; F. S. Earle, secretary and treasurer; Board of Managers, A. H. Stuart, F. E. Boswell, C. Chadwick.

We hope soon to fill our roll of members to the full complement allowed by our constitution, and as a "live" club trust to make our influence felt in all the matters mentioned above, satisfied, as we fully are, that it is only by such organizations throughout the country, acting in concert, that we can accomplish the results so earnestly wished for, and for which your valuable paper, the FOREST AND STREAM, is so strong and able an advocate.

Please enter our name upon your list of clubs, and in all matters requiring our co-operation count us in, every time. Very truly yours,

F. S. EARLE, Secretary.

—We have also received the constitution and by-laws of the Tecumseh Club, of Nebraska, an organization to secure the enforcement of the game laws, and to promote social enjoyment and improvement in shooting. Its officers are E. R. Wright, President; G. G. Gere, Vice President; E. R. Barnes, Secretary, and J. R. Coy Kendall, Referee.

We acknowledge a very courteous note from the Secretary. These sportsmen of Kansas and Nebraska deserve credit for their energetic action in so promptly organizing to meet the exigencies of the situation, but we can assure them that their task is not easy nor their burden light.

—A Boston correspondent does not agree with us in advising a person unacquainted with the woods to attempt a journey through the Adirondacks without a guide, and in a courteous four-page letter tells us, (rather overweeningly, we think,) how he and a friend passed three months there last year without any other guide than Ely's map and Wallace's book. They caught trout, killed deer, visited fifty-four lakes, &c., et cetera. The same correspondent desires us to give his address to that other correspondent who wishes to attempt the woods without a guide, and promises to tell him how to do it. Now, we hardly wish to shift the responsibility of that young man's life from ourselves to our Boston correspondent, though we must confess that, if the tourist will stick to the water courses and "carries," which are as much travelled as a turn-pike road, he will be likely to come out all right at the end of his vacation, and have an enjoyable adventure. Still, there are temptations to venture from the beaten track, and once off from it, the risk becomes very great. We will mention a few instances: A schoolmaster who had lived six months in Pike County, Pa., went out for a morning walk through the October woods, and his bones were found three miles from home in February. In the same county, a man was lost for several hours in a laurel swamp only a half mile wide with a road on each side, and he was not wholly a stranger in the locality. His were black and blue mementoes of his adventure for a fortnight afterwards. Two experienced woodsmen hunting grouse among parallel ridges, took the wrong valley and had to travel four miles over a mountain to the right one, involving a bivouac in an all-night rain-storm. The writer and an experienced guide spent several hours in a dense fog on Racket Pond, Adirondacks, looking for the outlet. The writer with two Indians, hunting over a moose range in New Brunswick, travelled twelve miles more than necessary, because they lost their way. A Canadian friend ventured two miles from the camp one frosty night, lost his way, got treed by wolves, and nearly perished before he was found. We mention these instances not to create bugbears, but merely to show how liable the most experienced are to get into trouble. For our own part, we prefer to take a guide at all times, unless we are most thoroughly acquainted. We were not educated at the Boston Latin school, but somewhere we learned the proverb: "*In medio tutissimus ibis.*"

—The Cincinnati Shooting and Fishing Club held the third day of the tournament on July 23d. There was a large number of sportsmen present. The first match was for seven prizes, forty-three entries, ten birds each, twenty-one yards rise. The first prize, a sterling silver cup, valued at \$125, was won by J. Jones of Cincinnati, and the second prize by William Caudwell of Cincinnati. The third and fourth prizes were divided by Horn and Gilman of Detroit. In the double-bird sweepstakes, eighteen yards rise, twenty-four entries, the five prizes of \$16 each and a consolation prize of \$4 were taken by Long and Horn of Detroit, Sherman of Beloit, Hall of Toledo, and Haskell of Grand Rapids, Mich. In the sweepstakes, twenty-six yards rise, twenty entries, the six prizes were taken by Sherman, Gilman, Proctor, Horn, Bagge and Terrell. Details of the last day's shoot have not arrived.

PORTLAND, July 25, 1874.

EDITOR FOREST AND STREAM:—

The Androscoggin Sporting Club of Lewiston, by their Secretary, Geo. Andrews, Esq., have sent to the various clubs in the State a circular proposing a State tournament, of which the following are the chief items: State Pigeon Shoot, by and under the direction of the Androscoggin Sporting Club; open to members of organized clubs in the State only. First prize—a diamond badge, valued at \$100, and the championship of the State. Second prize—an elegant fly-rod, presented by members of the Androscoggin Sporting Club. Third prize—a Smith & Wesson revolver, presented by C. F. Nason, Esq. The diamond badge to be accounted for to the A. S. Club, and held in trust by the winning club and a similar shoot provided by them annually till the badge be finally disposed of. The badge to become the property of a club must be won three times by that club. The other prizes to become the property of the winner. Five or more members to enter from each club. Entrance fee, five dollars per member. To shoot at fifteen single birds each. Androscoggin Sporting Club rules, as amended, to govern. In case of ties, the highest prize tied on to be shot off by those tied; then the next highest tied for, by the next highest set of ties, and so on. The charge of shot to be measured on the ground for muzzle-loaders, and shells to be sampled and examined.

If the proposition of the Lewiston sportsmen is as well responded to from other parts of the State as it will be from this city, there can be no doubt of its most distinguished success. Some of our sportsmen have been having fair luck with the woodcock, but the general result of our first year's "legal shooting in July" seems to be a decided opinion that, taking all together, it is far below September and October. A rather unusual circumstance came to my knowledge lately. A gentleman belonging to the Forest City Club, returning from a rather unsuccessful day's tramp through the "Covers," while passing near a cow yard attached to a barn, put up a pair of fine woodcock and secured them both with a single barrel. Bay snipe have put in an appearance, and trout are "too numerous to mention." In fact, as an enthusiastic angler exclaimed the other day, "fish are biting this year that never bit before in their lives."

Yours, F. W. S.

KENNICOTT CLUB,
CHICAGO, Ill., July 25th, 1874.

EDITOR FOREST AND STREAM:—

At a meeting of the Kennicott Club, held on the 21st instant, the following resolution was adopted:

Resolved, That our challenge issued in May last to any and all clubs in this State to shoot a match of ten men a side, at 10 single birds and 5 double rises each for the birds, be re-published, and the fact stated that the challenge had expired by limitation without an acceptance; therefore we extend the time thirty days from date, and the said match to be shot within thirty days after acceptance.

JOEL A. KINNEY, Secretary.

CREEDMOOR.—The range has been fully occupied from the date of our last issue by various regiments. On Tuesday 21st July, the Fourteenth Regiment, Fifth Brigade, Second Division (Brooklyn) Col. McLeer commanding, were at Creedmoor. Very good order was kept, and an offending member was put under military arrest. The following were the seven best scores:—

Names.	200 yds.	Total.	500 yds.	Total.	Grand Total.
Corporal Corey, C. J. A.	3 0 3 3 4	13	4 2 2 2 3	13	26
Private Ryan, Co. E.	4 2 2 4 3	15	2 2 4 3 0	11	26
Captain Mitchell, Co. E.	4 3 2 4 2	15	0 3 2 0 3	8	23
Private Nipple, Co. E.	2 2 2 2 2	10	2 3 2 3 3	13	23
Quartermaster Booth.	2 3 2 2 2	12	2 2 3 2 0	9	21
Brevet Captain Fisher.	2 2 3 2 2	11	2 2 3 2 2	9	20
Private Martin, Co. A.	3 2 2 2 3	10	3 2 0 2 3	10	20

It was noticeable that Col. McLeer who had lost his left arm in action, made a score of fifteen at both ranges, and that Major Schwrig, who had lost his right arm at the battle of the Wilderness, made nine at 200 yards, both officers shooting without artificial rest.

The third competition for the selection of the team to shoot with the Irishmen, took place at Creedmoor on Wednesday the 22d.

The following are the scores made at 800, 900 and a 1,000 yards, fifteen shots at the first two ranges; twenty shots at 1,000 yards:—

Name.	800 Yds.	900 Yds.	1,000 Yds.	Total.
J. Bodine.	48	52	43	143
General T. S. Dakin.	48	44	41	133
General Hawley.	31	49	52	132
A. Anderson.	41	36	52	129
L. M. Ballard.	49	30	51	130
G. W. Yale.	43	42	44	129
J. S. Conlin.	48	36	39	123
H. E. Fulton.	40	39	43	122
E. H. Sandford.	46	27	46	119
J. T. B. Collins.	42	27	46	115
J. P. M. Richards.	45	26	42	113
J. E. Whitley.	39	31	42	112

On the same day a squad of the Washington Gray troop, in conjunction with some members of the Eighth Regiment had some very good practice at 200 and 500 yards, the Remington earbines being used quite efficiently.

The Eighty-Fourth Regiment, Lieut. Col. Beattie commanding, tried their skill at Creedmoor on the 23d. The shooting was fully up to the average. We append some of the best scores made:—

Name.	200 Yards.	Total.	500 Yards.	Total.	Grand Total.
Captain Fullerton, Co. B.	2 3 3 2 0	13	2 3 3 2 2	12	25
Sergeant Booth, Co. A.	2 2 2 3 3	12	2 0 3 2 4	11	23
Private Levy, Co. E.	2 3 0 3 2	10	3 2 4 3 0	12	22
Sergeant Osborne, Co. C.	2 3 3 2 3	13	3 4 0 2 2	9	22
Private McAdams, Co. A.	2 3 2 2 2	11	3 3 2 0 2	10	21
Quartermaster Birch.	2 4 2 2 3	13	0 4 0 3 0	7	20
Sergeant McNeilly, Co. C.	2 3 0 2 2	9	3 0 2 2 3	10	19
Corporal Davis, Co. H.	3 2 2 3 3	13	0 2 0 0 4	6	19
Captain McCready, Co. A.	3 2 0 3 2	10	0 3 2 2 2	9	19

On Friday the range had an unusual number of rifle matches. The Rifle Club of the 12th held their contest for the Boylan medal and the 79th for the Vannett medal, while the 22d Regiment Rifle Association had their match.

For the Boylan medal, ranges 200 and 500 yards, seven shots at each distance:—

Name.	200 Yards.	500 Yards.	Total.
Lieut. Col. Gildersleeve.	22	22	44
Captain Smith.	19	22	41
Captain Banta.	19	20	39
Lieutenant Heizman.	16	22	38
Lieutenant Rich.	17	20	37
Adjutant Murphy.	18	18	36
Captain Burns.	16	19	35
Captain Fackner.	13	10	23

This medal must be won three times before becoming the property of the winner. It has been won once each by Captain Smith, Captain Burns, and now Lieut. Col. Gildersleeve.

For the Vannett medal, ranges and shots same as before.

The following are the scores:—

Name.	200 Yards.	500 Yards.	Total.
Private Pyle.	21	20	41
Captain Bruce.	16	22	38
Private Stephenson.	17	18	35
Private Keeler.	18	17	35
Private Duke.	19	13	32
Private Edmonstone.	23	9	31
Captain Ross.	17	11	28
Captain Lindsey.	13	13	26
Captain Clark.	15	11	26
Sergeant Melville.	17	8	25
Sergeant Cameron.	23	2	25

—The Ninety-sixth regiment, Colonel Stauff, were at Creedmoor on Monday, July 27th. We append the score made by the best twelve. The shooting seems quite above the average, but may be accounted for by a great deal of irregularity. Many of the members of the regiment used the stakes driven in the ground to indicate the distances as rests for their pieces. It is a pity that the absolute rules of the range, or the commands of the officers in charge, are not always obeyed by our citizen soldiers:—

OFFICE NATIONAL RIFLE ASSOCIATION,

93 Nassau St., N. Y., July 22d, 1874.

At a meeting of the Executive Committee of the National Rifle Association held at the office of the Association, 93 Nassau street, on Monday July 20th 1874, the following business was transacted:—Upon motion it was agreed that hereafter no rebate for dues paid by annual members be allowed upon their becoming life members. An application from the "Any Rifle Association," of Toronto, Canada, for permission to use the Range of the National Rifle Association at Creedmoor, L. I., for the purpose of a match with the Irish Team next fall, was on motion unanimously granted. An application from Col. Emmons Clark of the 7th Regiment Infy. N. G. S. N. Y., for permission to erect tents upon the Range at Creedmoor, for the use of his command during the present season, was also granted. It was *Resolved*, that, after August 1st 1874, no spirituous or malt liquors shall be permitted to be sold upon the Range grounds at Creedmoor, L. I., unless by special order of the Range Committee. The matter of preparing the programme of the Second Annual Meeting of the National Rifle Association to take place at Creedmoor, September 22d, 1874, was referred to Col. Wingate, and Lt. Col. Gilverleeve.

H. A. GILDERSLEEVE, Sec. N. R. A.

—The officers of the Province of Quebec Rifle Association in the most courteous way have requested that as many of the Amateur Rifle Club as possible will attend their match, conferring on the members of A. R. C. the title of honorary members of the Q. R. A. The N. R. A. has granted the Canadians permission to shoot their match at Creedmoor with the Irish Team. It is pleasant to notice these exchanges of civilities. All seems to tend towards a fine rifle contest this fall.

—A letter from Fort Sill, Indian Territory, dated July 17th, says that plover first made their appearance there on July 14th going south, fully two weeks earlier than usual. They were expected in abundance about the 1st of August.

—The Buckeye Shooting Club of Cleveland, Ohio, will hold a Pigeon Tournament on August 4th, 5th, 6th and 7th, when prizes to the amount of \$765 will be contested for. The Ohio State Sportsmen's rules to govern.

—A pigeon match was arranged last week between Ira A. Paine of this city, the champion of America, and James A. Ward of Toronto, C. W., (the one armed champion of Canada and the British Provinces). They are to shoot at twenty-five double birds, Forester Club rules, twenty-one yards rise, 100 yards boundary, plunge traps, and fifty single birds, twenty-one yards rise, eighty yards boundary, Rhode Island rules, each to trap and find for the other, or find a substitute, for \$500 a side and the championship of the United States and Canada. The match is to take place at Buffalo on the 13th of August.

EDITOR FOREST AND STREAM:—

The following is the score of a pigeon match at Monroe, Michigan, July 14th, at ten birds each, twenty-one yards rise, eighty yards boundary, for three prizes:—

	Straight.	Killed.
H. Smith.	5	8
A. Beaubien.	2	5
V. Kindler.	4	8
M. Nadeau.	0	2
E. Vanderheyden.	4	6
C. Kibbee.	2	6
W. Walldorf.	2	6
H. Conant.	2	6
J. Perkins.	9	9
J. Garwood.	7	8

Messrs. Smith, Kindler, and Garwood then shot off for the second prize, twenty-six yards, three birds each:—

Smith.	2
Kindler.	2
Garwood.	2

This being another tie the contestants went back to thirty-one yards, miss and out:—

Smith.	1 1 0—2
Kindler.	1 1 1—3
Garwood.	1 1 1—3

The six bird men then shot off for the third prize, twenty-six yards rise, at three birds each:—

Vanderheyden.	0 0 1—1
Kibbee.	1 1 0—2
Walldorf.	1 1 0—2
Conant.	0 0 1—1

Kibbee and Walldorf tied again, and then shot off at thirty-one yards rise, miss and out:—

Kibbee.	1 1—2
Walldorf.	1 0—1

The first prize was awarded to J. Perkins. (In shooting off for second prize V. Kindler's sixth bird was apparently not hit, but was shot by another party before leaving the bounds, upon which Mr. K. was allowed another bird. Mr. Garwood, not thinking the decision of the referee a fair one, objected to shooting off another time with Kindler, and gave him his right to second prize, but Kindler would not accept of it without being fairly won, thus leaving the second prize undecided.) The third prize was awarded to C. Kibbee.

Please say if you think the referee's decision was correct in allowing Kindler another bird. Yours truly,

C. D. T.

—Our supply of Mr. Roosevelt's books is exhausted. Should we be able to obtain any more copies, will give due notice of it.

The Purdey Breech-Loading Gun.

No. 712 MARKET STREET, PHILADELPHIA.

We call the attention of gentlemen desiring to buy the finest and best Breech Loading Guns, to the following extract from a letter written to us by JAMES PURDEY, 314 1/2 Oxford St., London, dated June 9 1874.

"As I have stated before, in this country Birmingham work is not and has never been considered first class, or good; the samples are sometimes taking, but the work after very different. I believe I am now the only one who can show the gun in every stage in hand on my own premises.

The only articles we have made for us sometimes are the locks; my men work for no other masters and are quite a select staff. The adjustment of the weight is a point we, or rather I, take great pains about, and if you gauge the light guns that I send out, you will find, although they weigh lighter, that the actual thickness of the barrels all round is in many cases stouter than very much heavier barrels of other makers; this is from extra care; the ribs and furniture of barrels being got out thin and regular to a weight, and then the barrels turned round and near as practicable to the thickness separately before the two are joined together; of course this is of great advantage.

Most of those you see of other makers are put together in the rough or ground state and then struck up in shape after they are put together; this, of course, causes the barrels to be much stouter on the joint or inside, and irregular.

The regulation of the shooting is mostly done by the bit with other makers; this gives good results while new and the polish lays circular, but when it wears off in a few months' shooting, the gun goes off its best shooting qualities considerably.

We draw bore our barrels in shooting, which takes a much longer time; it is done by a long lead cast in the barrel and worked lengthways; at the same time round and round, thereby laying the strokes lengthways; when the gun is made to shoot by this means, it keeps to its shooting for a very long time.

By the adjustment of weight we can give less recoil for the weight, than any gun that is made.

I have a set of men called Strippers, (unknown as a separate branch), who do nothing but overlook and perfect the work of others—this adds to cost, but greatly to the quality."

I am, gentlemen, yours very faithfully,

JAMES PURDEY.

**SUMMER TRAVEL.**

The season of business and summer travel has commenced, and we respectfully suggest the propriety of obtaining a General Accident Policy in

"THE TRAVELERS"

of Hartford, the oldest company in America, writing yearly or monthly policies of insurance against general accidents of business or occupation, as well as accidents of travel.

"THE TRAVELERS"

also grants all forms of life and endowment insurance, and offers peculiar inducements in its sensible all-cash plan, its definite, straight-forward contract, its ample security, its low premiums, and its good management.

JAS. G. BATTERSON, President.

RODNEY DENNIS, Secretary.

Also whelps by "Ranger," out of Mr. Cunliffe Brooks' champion setter "Jewell" and Mr. Garth's Field winner, "Bess."

Address G. de Landre Macdona Esq., Hilbre House, West Kirby, Cheshire, England. jly 16

PAMRAPO—Lovelier than the Bay of Naples; most magnificent views; the Ocean dimly seen in the distance; the Lighthouse; the Islands dotting the bay, with their beautiful green carpets; ships grandly passing till far out of view; steamers likewise receding from the sight bound foreward; yachts dancing; the gaily decorated barges of the boat clubs, conspicuous among which are the scarlet of the Tritons, the magenta of the victorious Argonauts, the blue of the Bayonnes, and the no less lively hues of the Claremonts, the Oneidas, and lesser crews. Do you want fishing? Here it is in its excellency. Old Robins' Reefs can tell you that around her rocky sides sport all the variety of fish to suit divers tastes, and in prolific supply. Yachts are in two hours loaded with the blue fish that are now so lively trolled for in these waters. Health reigns supreme. The census lately taken shows New Jersey to rank first in the United States. The rate of increase of this county (Hudson) is 15 per cent., in New York less than 2 per cent., Brooklyn only 5 per cent. But twenty-three minutes from Liberty street, and commutation eight cents. Houses and lots for sale for cash, by instalments, or terms to suit. Inquire for JOSEPH HALLOCK, Forest and Stream office, 17 Chatham street.

Ask your Dealer, or send direct to our

works for a supply of PURE Tobacco.

VIENNA, AUSTRIA, Nov. 30, 1873.

Messrs. Wm. S. Kimball & Co.:

Sirs—A friend of mine sent me, with a transport of Indian Skins, two pounds of "Vanity Fair," which I declare to be the best Tobacco I ever smoked. We have very good tobacco in Vienna—Turkish and Hungarian, but "Vanity Fair" is the King of all, by its aromatic flavor and the right sort of strength. My friend in New York got an appointment in California, by that reason I apply immediately to you, begging you to send me the enclosed ten dollars, a supply of "Vanity Fair," and send with the next steamer to Germany. If there is a German firm that sells your excellent "Vanity Fair," I beg you to enclose me the address.

NEW TROLLING SPOON.

In offering this Trolling Bait to the public the manu-
facturer feels confident he has brought this artificial
bait to such perfection that it needs but a trial to es-
tablish its superiority over all others for catching
Bass, Pike, Pickerel, Trout, Salmon Trout, Muska-
longe, &c. Three sizes made—No. 20 for fish under
3 pounds weight; No. 21 for fish under 10 pounds, No.
22 for very large fish. If not to be found at your fish-
ing tackle stores, these Spoons will be forwarded by
the manufacturer by mail. Price \$1.00 each.

JOHN H. MANN, Syracuse, New York

This arm was submitted in competition with over
one hundred different systems, American and Euro-
pean, to the Board of United States Officers, appoint-
ed by Act of Congress, 6th June, 1872, for the pur-
pose of selecting the best arm for the service, and of
which Brig. Gen. A. H. Terry was President. It suc-
cessfully passed through all the tests.

The following is the report of the Board:
"Resolved, That the adoption of magazine guns for
the military service by all nations is only a question
of time; that whenever an arm shall be devised which
shall be as effective as a single breech-loader, as the
best of the existing breech-loading arms, and shall at
the same time possess a safe and easily manipulated
magazine, every consideration of public policy will re-
quire its adoption.

Resolved, further, That the experiments before the
Board with the Ward-Burton Magazine System have
so impressed the Board with the merits of this gun,
that they consider it as more nearly fulfilling the con-
ditions above specified than any other tried by them
or of which they have any knowledge, and it does
recommend that a number of magazine muskets be
made on the plan for further trial in the field." (See
Ordinance Report.)

We are now receiving orders for these guns, and due
notice will be given in this paper when they are ready
for delivery.

The following is our scale of prices: Special Maga-
zine for large game, carrying from 3 to 8 cartridges,
70 to 85 grs. of powder, 350 to 400 grs. of lead, 8 to 10
lbs. weight, from \$60 and upwards, according to finish.
Special Long-range Magazine Rifle for Creedmoor
shooting, 90 grs. of powder, 480 grs. of lead, carrying
3 to 8 cartridges, weighing 10 lbs. from \$100 and up-
ward. Magazine guns for general use, carrying 3 to
9 cartridges, 60 grs. powder, 350 grs. lead from \$40
and upward. Single Breech-Loader, Creedmoor
shooting, for long range, 90 grs. powder; 480 grs. lead,
from \$60 and upward. Single Breech-Loader for
general use, 6 to 7 lbs., 60 grs. powder, 350 grs. lead,
from \$30 and upward. The calibre of all our rifles,
unless otherwise ordered, will be 45-100 in.

All communications should be addressed to
W. G. BURTON,
Care Ward & Co., 54 Wall St., N. Y.

W. W. GREENER'S
PATENT TREBLE WEDGE
Fast Breech Loader

Indestructible by Gunpowder.

This gun is specially designed to meet the require-
ments of American sportsmen. It will stand a larger
charge of powder, and shoot stronger than any other
system. For duck and pigeon shooting these guns
stand unrivalled. The action is simple in construc-
tion, quick and easy to load. They may be inspected
this season at all the principle gun stores in the Uni-
ted States. Prices moderate.

The second edition of "Modern Breech Loaders,
Sporting and Military," will be shortly published by
W. W. GREENER,
July 2 St. Mary's Works, Birmingham, England.

THE ANGLER'S CAROL.

Selected.

OUR sport is with the salmon rod,
Fine gut, tough ravel string,
A hook of the true "Kirby bend,"
Dark-bodied with white wing;
Dark-bodied with white wing, my boys!
A yellow bob behind,
And deep red hackle, fastened round
With tinsel well entwined.

A southwest wind that steady blows,
A dark-gray, cloudy sky,
A ripple o'er the water clear,
To lead away the fly;
To lead away the fly, my boys!
There, strike! the reel goes free!
With a new run fish, as fresh and strong
As ever left the sea.

The yielding rod bends like a bow,
And lifts him from his hold,
With quivering pull and bounding leap,
Or steady run so bold:
The steady run so bold, my boys!
As thro' the stream he flies,
Tells with what energy he fights
Before a salmon dies.

Reel up, reel up! one sullen plunge,
He takes out line no more,
Head down the stream! then haul him in!
He gasps upon the shore;
He gasps upon the shore, my boys!
His weight an English stone,
As beautiful a thing in death
As eye e'er gazed upon.

The sport is o'er, and home we go,
A bumper round we bear,
And drink "The face we never saw,
But may it prove as fair*,"
But may it prove as fair, my boys,
Each fisher drinks with glee,
And benisons to-morrow's sport
That it may better be.

M. A. FOSTER.

*Fisher's toast.

For Forest and Stream.

A Visit to White Top.

BY WAGNER.

JUST at this season, when everybody not in the mountains is suffering from the summer's heat, a few pages from one of the coolest places in the Union may prove refreshing reading.

White Top is the highest peak of the Unaka Range of mountains, starting in Virginia, and running south-westward into Western North Carolina, well described not long ago by Prof. Sperry Hunt in a paper in which he spoke of it as "the highest land east of the Mississippi." This is the same system to which the celebrated Bald Mountain belongs. White Top is the point where the three States of North Carolina, Tennessee and Virginia join, and is by far the most interesting and commanding of all the peaks of the range, affording a more extensive view in all directions, and the most beautiful natural panorama I ever cast my eyes upon, from the White Mountains in the blessed Yankee land to the Villadama Mountains, which overlook Monterey and the plains in Mexico. The altitude of White Top has been ascertained by actual measurement to be 6,800 feet above the sea—only 200 feet less than Mount Washington—and I do not hesitate to say that a visit to it is more enjoyable than to the latter, which is, at the summit, a mere barren rock, while on White Top the feet sink in luxuriant moss and grass, and the foliage and unique shapes of the stunted Norway pines are pleasing and attractive. There are no ugly crags and chasms, and no loose boulders to render the nervous unhappy, but all is beautiful and symmetrical, the features of the mountain being regularly curved and unbroken. The forests in the valleys at the base, and on the east, west and north sides of White Top, are dense and almost impenetrable, having never felt the woodsman's axe, for although the very finest timber abounds, and a line of railroad passes down the East Tennessee Valley, twelve miles distant, there is no access

to this primitive forest by wheels, and the valuable lumber that might be made could not be taken out over Iron Mountain, which, running parallel with the railroad for many miles, rises like a giant wall, with sides rugged and almost perpendicular, completely shutting out the despoiler from these secluded wilds.

With a congenial party of three, including a former comrade-in-arms, and a boon companion in many an adventure by flood and field, I started in the trouting season for a visit to White Top, from the pleasant little village of Marion on the Atlantic, Mississippi and Ohio Railroad, in southwest Virginia, all well equipped for a rugged journey, and armed with splendid rods and the concomitant tackle. The distance from Marion is about fifteen miles, the first nine of which are required to reach the foot of Iron Mountain. The route lays down the valley of the South Fork of Holston, a beautiful dashing little river, which the road crosses and recrosses at frequent fords, and which—were it not for the stupidity of that portion of the population delegated to legislation, in allowing mill-owners to put up dams without fish-ways—might be one of the best bass streams in the country. Trout are occasionally caught in it of fine size, but very seldom. All of its smaller tributaries are, however, excellent trout brooks. We started at early daylight, without breakfast, simply swallowing a cup of coffee to brace our stomachs until we could reach the base of Iron Mountain, where we calculated to leave our vehicle, and after breakfasting at the hospitable Squire Ransch's, who is chief engineer of a snug little apple-brandy distillery, and proprietor of a neat farm at that point, we designed making the remainder of the journey on foot, as nothing on wheels was ever known to go over the mountain at Ransch's. We had a charming drive down the valley, now rattling over a rough piece of road, and then splashing through the river, knee deep to the horses. The air was delightful, such as exists only in a valley 2,200 feet above sea level, and by the time the round, smiling face of the Squire greeted us over the palings of his gate, we were well prepared to do justice to the excellent breakfast which his wife spread for us, without the need even of the beguiling cocktail, which, with the aid of a supply of genuine Angostura bitters and some of Ransch's oldest and best distillation, my friend Reed concocted. By-the-way, who has ever known an army officer not an adept at cocktails, punches and toddies, both in the manufacture and consumption? They are jovial good fellows, too. "*Que j'aime le militaire!*" To the judge, fresh from miasmatic New Orleans, the mountain air was particularly exhilarating, and as for the "mountain dew," he sipped it "like a second Ettrick Shepherd." After a cursory inspection of the "still-house," situated in the usual place, up a "branch" in a hollow, which is very similar to all the mountain fruit distilleries abounding in this section, we ate our breakfast and departed, taking our horses to be led with our supplies packed on them.

Broad-soled, low-heeled shoes, loose and roomy about the toes, yet hugging closely at the ankles, are the only thing comfortable on such a trip, and I had the pleasure of considerable self-congratulation on the forethought which had prompted me to make ample provision in this particular. I have yet to find any shoes that will surpass heavy calf-skin or kip uppers with a half-inch sole reinforced, and extending full three-eighths of an inch beyond the uppers all around. Lacing I dislike; the heavy gum webbing, best quality elastic, wears well, and, while yielding to the pressure of the sinews, holds the shoe snugly to the foot, and fits the ankle so closely that no pebbles can enter. I never wear them higher than the ankle bones, and carry an extra pair, with socks, to change after fishing, for in the brooks of this region no one expects success unless he wades. The dense laurel which overhangs them at most points, renders it impossible to keep the bank. Gum boots and leggings have proven to me a delusion. No matter how high they may come, the ardent angler will sooner or later venture too far, or, perchance, slip into a pool at the foot of a fall, and then he is all the worse off for his protection, which he

finds to his annoyance will retain water as well as exclude it. So I always go prepared and expecting to get wet, with a pair of old woollen pants, a heavy blue flannel shirt, and a light felt or straw hat. I have no fancy for fine togery, and find nothing so comfortable as old clothes, and so cheap.

It was pretty steep walking up the sides of Iron, especially as we had lingered over our breakfast, until the sun had risen high enough to make himself felt. No effort has ever been made to grade the path, and it was so rugged and steep as to be very difficult for the horses. Several cool springs gush out of the rocks alongside the path, from which we refreshed ourselves. On gaining the summit those of our party who had never been there before were greatly disappointed by not obtaining the expected view of the monarch, still hidden from sight by an outlying spur of Iron Mountain known as Gray's Peak, rising to a great altitude. The path leads over a narrow connecting ridge to this peak, and then winds round its side, gradually declining. We had now entered the solitude of a dense forest, which grew denser as we descended. Suddenly, as we rounded the peak perhaps a half mile from its base, we came in full view of the mighty mountain, rising before us in wonderful size and beauty. The sight is an impressive one, and greeting the eye so suddenly its effect is greatly heightened. In fact the route we took is the most interesting one by which to approach White Top, as the location of the peak is so favorable for a surprise. I only know of another great natural wonder in this State where the conditions are similarly favorable, that is the Natural Bridge, over which I have conducted friends making their first visit on foot before they knew they were near it, then suddenly turning them back and parting the bushes at the brink, giving them a glimpse of the depths below. The sensation of surprise is somewhat different, it is true, but in both cases the effect is impressive. An easy grade for a coach-road might here be secured around the Peak, and this particular point would be one of the most interesting on the whole route, for there are few places where so complete a view of the great mountain is obtained. Here we can take in all its stupendous proportions at a glance, from where it emerges out of the darkness of the forest-covered valley below, until it hides its head in the clouds above. After a pull at the Captain's "tickler," a swallow of water from a spring at the turn, a bite of lunch, and a puff of "Lone Jack" in our pipes, we resumed our tramp, stopping occasionally to express our admiration of the giant before us, as some new splendor revealed itself. Soon we found ourselves entering the valley, and the trees grew thicker and thicker until the light of day was almost excluded. The path was narrow, damp, rugged and greatly impeded by huge fallen timber. The mountain was entirely lost to sight, and only once again in at least a half mile did we get a glimpse of it, seemingly overhead, when we emerged into an "old field," about two acres in extent, where we found crickets so plentiful that we were soon all on hands and knees to secure a supply for trout-bait, for use in the Laurel Fork, which we knew could not be far ahead of us, and where we afterward found them very convenient at points where the laurels rendered it impossible to cast a fly. A few hundred yards farther brought us to the stream, which was as clear as crystal, and flowed over a bottom of cleanest gravel and moss-covered boulders. We soon secured enough trout for supper and breakfast, and then moved forward to find the domicile of a rugged little old man named Seabird Dinkins, who lives just at the base of White Top, and is the genius that presides over the mountain, entertaining in his comfortable little log-house those who want entertainment, and acting as a guide and counsellor, generally.

We retired soon after dark and arose early next morning, having enjoyed a very refreshing sleep on the firm "shuck" mattresses provided for us, and after despatching the remainder of our trout for breakfast began the ascent of the mountain, which commences at Dinkins' back door. Instead of taking a winding path with tolerable easy grade,

usually preferred by persons on horseback, requiring about four miles travel to reach the summit, we went a shorter but steeper route, leading as straight as possible to the top. The distance seemed at least two miles, and we were obliged to rest very often. Most of the way we were in dense timber consisting of many varieties. In the valley grew the tall hemlock of immense diameter. Just about Dinkins' house the poplar, sugar maple and oak began in successive belts; next was a belt of chestnut, then a belt of the finest ash I ever saw, then a splendid growth of beech, next wild cherry in abundance, which in turn was followed by beech again of a more stunted growth—this gradually disappearing as we neared the top—tall Norway pines of the most beautiful and symmetrical form succeeding. These grew smaller in size as we ascended, and sent their branches out horizontally instead of upward. Finally we reached the top, where they were so stunted that they appeared to have been flattened out by weights; the branches being so gnarled and interwoven as to admit of one's standing upright on the top of the trees. The moss under foot was beautiful. In order to obtain a view we had to pass around to the southwest side of the apex, where there is a spot free from trees. Here we spent hours viewing the landscape below, which was truly splendid. Looking down toward the west upon the Tennessee Valley, we could see all the towns, villages and farms nestled in it, and beyond the Clinch and Cumberland Mountains. Even Cumberland Gap, toward which the boundary between this State and Tennessee makes from this point in a direct line, fully a hundred miles distant, could be plainly discerned. What heightens the interest of this view is the fact that Cumberland Gap is also the point of junction of three States—Virginia, Tennessee and Kentucky. On the south, overlooking all the big hills, we saw "Old Baldy," Mount Mitchell and Mount Black, in North Carolina. Occasionally the view was obscured by a passing cloud, which enveloped us in impenetrable mist—once a shower fell—but in a few moments the stiff breeze would waft it by, and all would be clear again. It was interesting then to watch the clouds after they had passed us, speeding away below us, as it seemed, and trailing their shadows over the hills and valleys. A complete description of our enjoyment of the cool, rarified air, and our sensations and feelings, would lead me into what might seem like extravagance, so I desist. Suffice it to say that we spent the day on the mountain, and left it toward evening with great reluctance. Descending we took the longer path referred to, and were afforded a fine view of the south slope, which is entirely free from timber, and covered with a superb growth of blue-grass, where some of Dinkins' cattle and "nags" were feeding. We were not specially equipped for game, else we might have shot a fine string of squirrels, as they were very numerous. We spent another night at Dinkins', and returned home next day by way of the Squire's, which is the route I would recommend to all who are sufficiently impressed by this description to desire to visit White Top.

The streams at the base of this mountain are famous for trout, and they are very seldom visited. Among them are the Laurel Fork, White Top Fork, Horse Creek, Fox Creek, and Helton Creek, the first emptying into waters which lead to the Gulf by way of the Tennessee, and the last named passing into New River and thence into the Ohio. I doubt if there is any section in the Union, so near civilization, containing so many virgin trout-brooks as this.

For Forest and Stream.

BASS FISHING IN LAKE WAWAYANDA.

FEW are aware that the veritable lake bass of the north, (*Grystes nigricans*), exists in New Jersey; yet I have found him in Sussex County, of this State, in all his gaminess, vaulting, diving and resisting. I had been told of the bass fishing I could enjoy should I visit Lake Wawayanda about twenty-five miles from Newton, N. J., but satisfied myself the fish referred to must be the bass of the western rivers, (*Grystes salmoides*), which does not readily take the artificial fly and affords less sport than his northern cousin. When I learned that the fish with which this lake was stocked came from Newburg, N. Y., I became more interested and a party was made up at once to sift the question to the bottom the following Saturday, July 18th. Our numbers consisted of four gentlemen, all ardent sportsmen, and three of them, at least, well known to the editors of the FOREST AND STREAM, Theo. Morford, Esq., Mr. James Northrop and Mr. Horace Smith, your correspondent making the fourth.

I arrived at Newton from Philadelphia just fifteen minutes before I found myself seated in the wagon which was to convey us to the lake.

By the time we reached Vernon it was too late to undertake the ascent of Mount Wawayanda, over which we should have to make our way before the lake could be reached, and Mr. Thomas S. DeKay, the proprietor of a very fine hotel at this place, took us under his wing for the night. This gentleman has quite a number of city boarders at his house enjoying his royal table and the splendid views the surrounding country presents.

Rising to an early breakfast we were soon ready to make the ascent of the mountain, a portion of which bears the euphonious title of "Break Neck," owing to a steep declivity of about a mile necessary to be climbed in reaching the top. A tedious hour's work brought us to the summit, and it was not long before the lake showed in the distance. We learned here for the first time from Mr. Hunt, who resides near the lake, that the fish we had come so far to test were the veritable *Grystes nigricans*, the genuine leaping lake bass, and that they would rise to a fly as well as to a grass-hopper. Although furnished with a stock of flies we repaired to the hay mow for "hopper grasses," the last place I should have looked for them. We soon captured all we wanted in the fresh cut hay and embarked one and all in the only boat on the lake, with Mr. Theo. Morford at the oars, Northrop and myself trolling from the stern, the Squire acting as pilot on the bow on the look out for hidden stumps, as this portion of the lake was full of them. As the boat moved slowly along, the first rise of the day was to my fly, but I missed the bass. Northrop's turn came second, a fine fish, which he securely hooked and played in style and boated safely. Reaching the main portion of the lake, we landed Morford on a rocky island, as he wished to try casting from shore, while your correspondent took the oars, and with Northrop and Smith in the stern of the boat, rowed down the margin of the lake. Rise after rise, leap after leap, struggle after struggle, now

became the order of the day, and the sport was glorious indeed. I could not resist the temptation, as I rowed along, to cast my line occasionally over the water, and although it was awkward work, managed to take two fine bass.

When we returned to Morford we found he had very poor success during our absence, so taking him into the boat we moved over the same course we had just traversed, satisfied it harbored many more fish. And so it proved. One of the crowning captures of the day was now made by Mr. Morford as we passed by a rocky point: a regular "he fellow," as the Squire called him, took his fly and began a terrific fight. My friend's light fly rod bent and quivered, and for a time I thought he would lose his entire tackle, so great was the resistance and struggle. Gracious! but how this bass did leap from the water! Fully three feet did he jump into the air, vainly trying to rid himself of the hook which Morford kept firmly in its place. It was a full quarter of an hour before the trophy was boated, and a noble one he proved to be. We were all using light fly rods, so some idea can be had of the work done when a two-pounder was hooked.

By one o'clock the bass appeared to quit feeding and fewer fish were caught; but satisfied with what we had already done, we returned to shore and partook of a fine repast at Mr. Hunt's, determining to try again in the afternoon, when we hoped the bass would be on the feed again. We were disappointed, however, for few were taken. Toward evening, as we were rowing toward home, Mr. Northrop remarked that he intended catching the largest bass of the day before he left the lake, and a few minutes after, a terrific rush and tightening of his line showed he had hooked a monster. Mr. Northrop is a man noted for never becoming excited or moved in any situation, and his coolness is remarkable, but on this occasion he exploded and gave evidence of his delight in a very marked manner, as the bass showed his great size in his leaps from the water. "Take me to deep water, where I can kill him," he shouted; for where we then were was dangerous ground among the sharp rocks near the shore, and the fish was taking out line at a great rate. The fight was a long and stubborn one, but the bass was safely boated at last, and proved to be the heaviest yet caught, and a noble trophy for the winding up of the day's sport.

I wish I could advise my friends of the rod to visit Lake Wawayanda, and enjoy the bass fishing its waters afford, but I cannot, for, on the 18th of July we were a favored few, a very favored few, if I can use the expression. Mr. Hunt had great trouble, when he did allow promiscuous fishing, in keeping parties from entirely depopulating his lake of bass, and so he must draw a line somewhere. Next summer an arrangement can be made probably, when a sight for a day's fishing can be purchased.

We returned to DeKay's for Saturday night's rest, starting homeward Sunday morning, stopping on the way at the residence of Mr. Thomas Lawrence for dinner, where we were entertained in a very hospitable manner, and arriving at Newton at 8 P. M., highly gratified with our visit to Lake Wawayanda.

HOMO.

For Forest and Stream.

SPORT IN MISSISSIPPI.

THE prospect for a plentiful supply of Bob White this season is very good; but where they come from it would be impossible to say. The last day of the present season, in company with two friends and five good dogs, I hunted honestly and faithfully from eight A. M. until six P. M., and we only succeeded in bringing twenty-five birds to bag, and we did extra good shooting, and we were twelve miles from town, in a section where birds had always been exceedingly numerous, but they had all disappeared. Since they have commenced pairing off they seem to be quite plenty. One of the first sounds that comes through my open window in the early morning, mingled with the song of the mocking bird, the thrush, and the oriole, is the cheery note of Bob White. And in my rides and drives out of town I see Bob and his brown mate in field and woodland, and hear his cry from every stubble. Some of the young broods can fly, I hear, though I have not seen a single brood this summer. The June rains did not drown them this year, as it has been remarkably dry since early in May. The infantile turkey is now about the size of a spring chicken, and I hear of several broods having been seen in the vicinity.

The *Philohela minor* does not breed here, and stops but a short time early in spring in our marshes. Not having the woodcock, we are reduced at this season to the squirrel as the only legitimate game at which we can burn powder. According to our friend, the field editor of the *Turf, Field and Farm*, the squirrel should be shot only with a grooved weapon of precision. But what if his hand is not as steady nor his eyesight as good as in the long ago? when with his muzzle-loading rifle he took *scirrius* "on the fly" as it were, when he was gyrating on the extremity of a long and limber beech bough, seizing a nut, and disappearing instantly within the cover of the thick foliage. If you hunt him on the borders of the cornfields you cannot do much execution with the rifle, for as you walk along never so carefully, stopping occasionally to look and listen, the first intimation you have of the proximity of a squirrel is a violent agitation of a cornstalk, from which he springs, and here he comes with a flying leap—legs and tail spread—as if he had been hurled from a catapult, and lands in the brush and is off in a twinkling. In the fall, when the leaves are off the trees, rifle shooting at squirrels is good sport for those who like it, but if we have to hunt them, give us a shot gun, and a breech loader at that. Did you ever hunt squirrels with a breech-loader? From long familiarity with all kinds of muzzle-loading arms, the rodent under consideration had learned exactly how much time was required to load and cap a gun. The breech-loader being a modern invention, he is not yet familiar with its workings. With the old style gun, after you had fired at him with both barrels in the top of some old forest giant, he would come down to the very lowest limb, whisk his tail, and chatter at you in the most impudent style, until just about the time you were ready to cap your gun, when with a tremendous chattering he would be off and up the tree again out of sight. But he can't come that dodge on you when you have a breech-loader. I tried him on with it. He would come down when he thought my gun was empty, or he would take a notion to get on to another tree. When I reached for a shell I imagine he thought—if they do think—that I was handling my powder flask; the snap of the gun when closing he mistook for the click of the

flask spring, and was in no hurry. How terribly scared he must have been, for an instant only, when he saw the deadly muzzles brought to bear on him. But when the jarring report died away he was lying at the foot of the tree, clean killed. Sixteen to seven was the score of a breech-loader against a muzzle-loader in a few hours' squirrel shooting. It is almost murder in the first degree, but the farmers say that they destroy the corn, and then, when you make them into a Brunswick stew, you are inclined to think that squirrel murder is a pardonable offence. If there is any sport in squirrel shooting there are a good many drawbacks to its full realization.

There are ferocious wood ticks and microscopical chiggers, not to mention the snakes; and speaking of snakes reminds me of the fact that some persons, not having the fear of the game law before their eyes—for there is none—went out a few days since to a place called "Freedom," in the pine hills, to have a camp deer hunt. The first day in the woods they killed four large rattlesnakes, fearful of fangs, deadly of venom, and terrible of rattle, and as the supply of "snake bite antidote" was limited, and the nearest still house was forever still, and furthermore, as they had not lost a single *Crotalus horridus*, and were not hunting them, they returned from whence they came, and left the *Crotaluses* and the deer in peaceable possession of their domains. Long may their snakeships wave—their tails—until brown autumn comes at least, and may they keep off all who would dare venture within those wilds until the season comes to hunt the deer.

"GUYON."

Corinth, Mississippi, July 22d, 1874.

For Forest and Stream.

TWO HOURS ON RANGELEY RIVER.

BY THOMAS SEDGWICK STEELE.

IT would be impossible to say that the weather selected for my ramble along the banks of Rangeley River, Maine, was all that could have been desired. Those beautiful mornings, often described by writers, do not always fall to the lot of every angler, and when camping in the woods it often seems as if it "never rained but it poured," and that a greater portion of the time. Great heavy clouds of vapor hung down the mountain sides, almost concealing them from view, while heavy showers of rain accompanied by thunder and lightning, would strike our camp, carrying all that was moveable along with it.

So the morning and first part of the afternoon had been occupied in cleaning my gun and putting numerous other traps in order, but at four o'clock the storm having abated, I called my guide, and buckling on my invincible "Mackintosh wading pants," we strolled up the stream. We found "Indian Eddy" was as well patronized as usual, and at that time many a speckled beauty was leaving its ripples to be soon transferred to the caufs dancing attendance at the stern of the boats. So on we pushed, occasionally taking a fish, until we reached a certain position on the stream. Oh! shall I whisper where? I well know the object of the FOREST AND STREAM is to give location of good fishing resorts, but a description of each stone and tree is seldom resorted to. Suffice it to say, that it was beside a certain overhanging bank, near a certain number of handsome fir trees, and that an old dead stump around which you can just clasp your arms, reflects itself in the stream, and furthermore, that said stream at this time, in June, is about four feet deep; and if by this description you can discover my secret, you are welcome.

Getting to the lee of a "smudge," built by the guide to get rid of the angler's pests, the black flies, whose supply always more than equals the demand, I fastened to my line the most tempting treasures from my fly book, and made a cast far out over the shining waters. Thinking the flies did not alight on the water to my satisfaction, I was about making a back cast when a gleam of silver far down under the dark waters, a rush, a splash on the surface, and the next moment my stretcher fly was fast in a pound trout. Placing my finger on the line above the reel, I realized he was firmly hooked, and I prepared myself for the battle which was sure to follow. A pound trout is not much to handle with plenty of room, but take overhanging boughs, a slippery bank and a wild rushing river, and the odds are frequently in favor of the fish.

The Rangeley River flows from the Rangeley Lake, which is ten miles long, through the woods a distance of two miles, and empties itself into the Mooselucmagentic Lake, another large body of water some twelve miles long by four wide, and with such velocity that in the spring, at which time this incident occurred, it was with difficulty you could maintain your foothold when only a short depth in the water. Many an angler has mistaken its hidden force, and while wading that stream capsized in its turbulent waters and risen to the surface "a sadder but wiser man." So with the fish tugging away at my line, (as a trout only knows how,) it required great skill and careful management not to lose him, or be upset myself. A few wild rushes up and down the stream, occasionally showing his gleaming sides near the surface of the water, bending my eight-ounce rod as if it were a twig, and with mouth wide open, he soon lay exhausted on the bank. Then another cast, and another fish of about the same proportions, followed by others still of 1½, 1½ and 2 pounds each, my flies hardly touching the foaming surface before they were eagerly taken by the voracious fish. Sometimes two and three would spring for the enticing flies at the same time, and my past ideas of the delicate sense of a trout was badly shocked by their selfish exhibitions of character. For two hours, the shortest I ever experienced, these trout kept me busy, and sometimes when giving them the final blow, bending my split bamboo three feet below the butt, while my faithful guide stood at my side, net in hand, transferring the fish to the cauf as fast as possible. You who take no zest in out-door sports, or rambles by forest and stream, and think with the old adage "that angling is merely a stick and a string with a fish at one end and a fool at the other," what wouldn't I have given to have placed you suddenly in my position, and if the blood in your veins didn't course more freely after such excitement, then you must be as dead to all enjoyment as the Egyptian mummies in the museum at Niagara Falls. But as "all things have an end" so did these joyous moments, which were finally brought to a close in a more hasty manner than I anticipated.

For the last ten minutes the trout had ceased to rise, and we had concluded that we had either exhausted the pool, or by repeated casts had frightened them away, (for we had not moved three feet from our first position during

the whole time,) when letting my flies float slowly under the big stump, I was immediately reminded that one fish at least was left to tell the story. Taking the fly greedily, as if he meant business, he dashed up the stream with lightning speed. Checking him in his wild career by "giving him the butt," I succeeded in turning his head towards me, when away he went backwards and forwards across the stream, (which is some twenty feet wide,) and then down into the most turbulent and rapid of the water, making my reel hum like a buzz saw. Now I tried to hold him a little, which brought the tip of the rod at the water's surface; now he would sulk under some mossy bank or overhanging rock, from which I was obliged to rouse him, until finally he dashed for the middle of the stream, where he wound the line around and around an immense boulder. Plunging into the water up to my waist I routed him from his fortress, when away he started down stream around a curve in the river, dragging my line through the alders and brush which lined the water's edge, while over the slippery stones and through numerous holes I followed till he had exhausted over one hundred feet of my line. Then I finally succeeded in stopping him, but against the wild rushing water, which boiled around me, I could only hold him. The guide now hastened to my side, and held my rod, while following the line through the middle of the stream I held it firmly half way between the guide and trout. Guide then reeled up the line to where I stood, and handed me the rod, and I congratulated myself on having gained fifty feet. But it was only for a moment, for I again started the fish, and away he dashed down the stream, carrying with him the fifty feet of line I had just gained. I was now determined to net him at all hazards, and "giving him the butt again" I brought him to bay. My guide now went ashore, and with net in hand, disappeared among the bushes to look up his lordship's headquarters, while I followed carefully down stream, full of anxiety and suspense. Some time after the slackness of the line told me I had either lost the prize or "William" had secured him for me; the line was free, at all events, and I patiently waited the result. Finally, to my delight, the guide appeared, triumphantly bearing the net with my treasure safely secured in its meshes. He had captured him over one hundred feet from where he left me. The trout turned the scales at 2½ lbs., and was one of the finest specimens of the *salmo fontinalis*, as regards color and proportions, that I ever landed. We reached camp at 6½ o'clock, P. M., having been absent only two-and-a-half hours, half an hour of which I was occupied in going and returning from camp.

Throwing back into the water a number of the smaller fish, we weighed the remainder, which numbered forty-eight, and they turned the scale at fifty-six pounds. Since that day I have caught my two, three and even six pound brook trout, and have experienced a variety of emotions while enjoying their capture, but I look back to the time when I landed with an eight-ounce rod forty-eight trout weighing fifty-six pounds in two hours' fishing, as the most successful day in my whole experience.

For Forest and Stream.

TRIP TO NORTH WOODS.

HAVE just returned from annual trip to the North Woods. For company I had my friend D., of New Haven, and guide, Carl Murat Alger, of Martinsburgh, N. Y., a man of long experience, good judgment and the best cook of all the guides that I have known. Any one wishing a guide for this section can obtain him by addressing as above. We obtained our supplies at Fenton's (No. 4) and sent them into (Wardwell's) Stillwater, where we take our boats. The water has been unusually high all the spring, but for three or four days before we arrived it had been steadily falling. We took a few trout on our way up and arrived at our old camp on Albany Lake, tired and hungry. We found it unoccupied and took possession. We staid here, having delightful weather and plenty of fishing on the rapids at the head and foot of the lake. What more delightful pastime than wading the rapids, climbing over rocks in the rushing waters and taking in trout at every cast of the flies. The trout on the rapids were small but of delicious flavor, but I think they made up for their size in quantity, as we could take all we wanted in a few minutes. This lake (Albany) is about five miles long. At the head there are several good sites for camps, and perhaps the best is the old well-known Camp Partridge. The lower part of the lake is low and swampy. Some of the bays and coves are filled with lily-pads and the various grasses known to this region, affording excellent feeding ground for deer; in fact this little lake is considered one of the best places for deer in the Wilderness. We found the flies very bad, and the ever-present mosquito played his horn both day and night, but I comfort myself with thinking that if these pests did not exist, perhaps these old solitudes would be peopled with a busy crowd, and trout and venison would be no more; so let them sing and bite, we'll endure the discomforts for the sake of solitude and trout. No hotels in this region, thank the Lord! and we all hope that at least this section shall be left as nature designed it—wild, rugged and almost impassable. The flies used by us were white miller, brown and red hackle, mostly, but my guide advised me to bring some red or some other flies of more gaudy colors, as some dark days they are more taking.

We took a run up to Smith's Lake, five miles above here, with a mile carry to reach it, and four miles by boat. Found no one on the lake, which, by-the-by, is a gem of the Wilderness; here we staid two nights, calculating to do a little fishing for lake trout, but we got fooled, as you shall hear. Instead of staying at Syracuse Camp we concluded to try Towanda Camp, named after the party who built it from that place. It is a fine camp, consisting of kitchen and sleeping camp, perhaps ten feet apart. Large trees surround the camp in every direction, making it cool and nice in a hot day. My guide, after a survey, says: "Boys, there are some trees unsafe around this camp, and some one will wake in the night too late to escape being crushed to death, perhaps; trees as heavy as these ought to be cut away before a camp is built—that's my opinion." Nothing more was said at the time, but after supper a storm came up, and almost without warning a tremendous wind with rain struck us, and trees came crashing down in every direction. Soon, amidst the roar of the elements, I heard Carl cry: "Run, boys, there comes that big hemlock," and run we did for dear life, barely escaping being crushed. As luck would have it, the tree fell directly between the two camps, injuring neither. The storm lasted full twenty minutes, and was one of the worst storms in that region

for years. It extended clear out of the woods, unroofing barns, &c., and trees had to be cut out to allow boats to pass up the river. It was a grand as well as terrible sight, and a new experience to me of woods life. It also learned me a lesson not to camp in heavy timber again, as the trees in this region are, many of them, unsound and liable to fall from their own weight, crushing camp and sleepers at the same time. I think a little advice on selection of camp sites would form a good column for your paper; think I have never read much on that subject. Our set line was blown into the fire by the wind and burned up, so our lake fishing was postponed, and as we had no more line with us, we went back to our old camp at Albany. Here we staid fishing, hunting and eating pancakes till our time being out we packed up and sorrowfully set our faces homeward. On our way down we found the spring hole fishing splendid; took eighty-nine fine ones, some over a pound. (The fish do not run large on the river,) brought out forty-three packed in moss by our guide, which came through as sweet as when first taken. Arrived home safely and ended our summer trip.

Hartford, July 25, 1874.

Rational Pastimes.

—In the cricket match eleven of M. C. C., of London vs. American twenty-two base ball players, which was commenced at Lord's grounds, London, August 3d, the Americans won the toss and sent the eleven to the bat. They had disposed of four wickets for forty-four—an average of eleven to a wicket—when "lunch" had to be attended to, and after that the exhibition game of base ball took place. This over, the cricket match was resumed, and when stumps were drawn, at six P. M., the twenty-two had disposed of five wickets, including the best batsmen of the team, for eighty-eight runs. The next day, August 4th, the game was continued and finished, both parties having agreed to make it a match of one inning each on account of the weather. The Americans were victorious, scoring 107, with wickets to fall, to the English club's 105 in their complete inning. Six Englishmen and two Americans made no runs. The English club gained 14 runs from byes and wides. The highest individual English scores were 27 and 24. There was great excitement at the conclusion of the game. Over 6,000 spectators witnessed the match, and great interest was taken in the proceedings. The receipts at the gate exceeded £250 sterling, exclusive of the extra charges for seats in the pavilion, grand stand, etc.

—The following is the record, up to our going to press, of the base ball games played by the Boston and Athletic nines in England:

July 30—Athletic vs. Boston (ten innings), at Liverpool..... 14 to 11
July 31—Boston vs. Athletic, at Liverpool..... 23 to 18
Aug. 1—Athletic vs. Boston, at Manchester..... 13 to 12
Aug. 2—Boston vs. Athletic, at London..... 24 to 7
Total for Boston, 70; for Athletic, 52.

Their last game was marked by the appended score:—

Red Stockings..... 3 7 4 0 5 0 5 0 0—24
Athletic..... 3 0 0 0 1 1 1 0 1—7

—On July 29th the second match between the selected American eleven, who are to represent the States in the Halifax tourney, and a picked eleven of the Philadelphia clubs, was played at Germantown, and the result was the defeat of the city team in one innings by a score of 199 against 44 and 100. Rob Newhall's 88, not out, was the feature of the Halifax team's batting, Caldwell's 34 and Magee's 21 being the other good scores, Dan Newhall getting 12 only. On the city eleven's side Lange scored 40, George Newhall 34, Davis 13, not out, Newbold 12, and Hopkinson 10. Brewster and R. Ashbridge were absent on Halifax side, so only nine men went to the bat. Davis took the majority of wickets on the city side, and Meade on that of the representative eleven. This eleven will play the base ball twenty-two, now in England, on the return of the latter to the States in September.

—The Germantown nine—chiefly cricketers—defeated the Rivertons at Riverton on August 1st by 12 to 2, in a seven innings game. Sharp bore off the palm both in the field and at the bat.

—The Manhattan Cricket Club play matches at Hoboken with the Staten Island Club on August 11th and 18th. Their second eleven defeated the St. George second eleven July 30th, by 101 to 71 at Hoboken.

—The American base ball tourists duly arrived in England on July 26th, landing at Liverpool on Sunday and putting up at the Washington Hotel of that commercial city. On the 30th of July they played their first base ball match in England at Liverpool, and the weather being fine there was a numerous attendance of spectators present and considerable interest was manifested in the proceedings, loud applause greeting the fine displays in the field. The contest proved to be close, and quite exciting to those acquainted with the game, the result being the success of the Athletic Blue Stockings by a score of 14 to 11 in a ten innings game. On July 31st they played their second exhibition game, and this time the Boston Red Stockings won by a score of 23 to 18. The weather was unfavorable for a large attendance, rain twice interrupting the progress of the game, which lasted over three hours. On August 1st they were named to play base ball in Manchester. The following is the revised programme of their tour as published in the *London Sporting Life* of July 18th.

July 20th—At Liverpool, base ball exhibitions.
August 1st—At Manchester, base ball exhibitions.
August 3d, 4th—At Lord's, M. C. C. vs. Twenty-two of America.
August 6th, 7th—At Prince's, P. C. C. vs. Twenty-two of America.
August 8th—At Richmond, cricket and base ball.
August 10th, 11th—At Crystal Palace, base ball exhibitions.
August 13th, 14th—At Kennington Oval, Surrey Club and Ground vs. Twenty-two of America.
August 15th, 17th—At Sheffield, Sheffield vs. Twenty-two of America.
August 20th, 21st—At Manchester, Manchester vs. Twenty-two of America.
August 22d, 24th, 25th—At Dublin, Dublin vs. Twenty-two of America.

It will be seen from this that their Paris and Scotland matches have been left out. A telegram from London dated July 31st says: "The interest in the exhibitions of the American base ball players is increasing. The English public interested in field sports begin to understand the principles of the American national game. The Midland Railroad will run special excursion trains, with American Pullman cars, to all points on its line where the clubs play." Mr. Chadwick's English book of base ball was issued in London early in July, and notices of it appear in the London sporting papers.

—The Mutuals defeated the Chicago nine in Chicago on

August 1st by a score of 6 to 2, the White Stockings only scoring in one innings. Since the first game the Whites have never exceeded a score of four runs in their games with the Mutuals, the New Yorkers beating them every time.

—The Knickerbockers—the model amateur club of the country—went up to Englewood, N. J., on July 30th, and there had a pleasant six-innings game with the Jersey villagers, which ended with a score of 10 to 8 in favor of the "Knicks." They were short handed as usual.

—The Mutuals are to play the Eagle Club of Louisville on August 10th at Louisville.

—The finest display of ball playing ever seen in Chicago was on the occasion of the benefit match given to Jimmy Wood on July 29th, the match being an exhibition game between the Athletics and White Stockings, played under the ten men and ten innings rule, Ferguson playing at right short for the Athletics and Collins for the Whites. At the end of the tenth innings the score stood at 4 to 4 only, and in the eleventh innings the Whites won by one run. The score was as follows:

Athletics..... 0 0 0 2 0 0 2 0 0 0 0—4
Chicago..... 1 0 1 0 0 2 0 0 0 0 1—5

The new game is highly spoken of by the Chicago papers.

—On July 19th a large crowd witnessed the match between the Athletics and the "Reds" of St. Louis at St. Louis, the professionals winning easily by 27 to 2.

—The New York Fly Aways polished off the Chelseas by a score of 24 to 8, on the 29th, on the Union Grounds, Brooklyn, the crowd present being as large as at the Mutual and Hartford match.

—On the 28th the Equitable Insurance nine defeated the Produce Exchange team at the Capitoline Grounds by a score of 16 to 10.

—The following is the amateur rule of 1871, defining legal amateur players:

"No person who shall be in arrears to any other club than the one he plays with, or who shall at any time receive compensation for his services as a player, shall be competent to play in any match game. All players who play base ball for money, place or emolument, shall be regarded as professional players, and no professional player shall take part in any match game between amateur nines."

—Some remarkably fine amateur games were played during July, among which may be named the following:

July 1—Diamond vs. Russ, at Hartford..... 6 to 0
July 4—Confidence vs. Harvard, at David's Island..... 7 to 5
July 4—Concord vs. Staten Island at Staten Island..... 6 to 6
July 4—Providence vs. Woonsocket, at Woonsocket, R. I..... 8 to 2
July 7—Amherst vs. Star, at Amherst, Mass..... 5 to 4
July 10—Una vs. Star, at Northampton, Mass..... 4 to 2
July 10—Neptune vs. Onward, at Boston..... 8 to 0
July 10—National vs. Mystic, at Brooklyn..... 8 to 7
July 16—Confidence vs. Staten Island, at Staten I..... 8 to 4
July 18—Salas vs. Rattler, at Central Park..... 9 to 8
July 18—Robt E. Lee vs. Lone Star, at New Orleans..... 3 to 0
July 18—Commercial vs. Pastime, at Baltimore..... 4 to 2
July 22—Grafton vs. Harvard, at Boston..... 8 to 7
July 23—Chapman vs. Atlantic, at Baltimore..... 7 to 6
July 24—Tecumseh vs. Club nine, at London, Ont..... 4 to 3
July 25—Waverly vs. Wm. Kinsely, at Hoboken..... 7 to 5
July 27—Empire vs. Alpha, at Newark..... 7 to 6

This shows a decided improvement in amateur playing since May.

—On July 30th, the Quoddy Club of Eastport, Maine, were visited by a party of players from Boston, including several of the Harvards, and in a match game the Quoddys won by 22 to 9.

—On July 31st the Chelsea Club of Boston defeated the Lowells by 11 to 5.

—The Graftons astonished the Live Oaks at Lynn last week by defeating them by a score of 12 to 1.

—The Maine State Tournament of Senior Base Ball Clubs comes off at Deering September 1st. There will be thirty-one games, ten clubs being entered—the Kennebecs of Hallowell, Rivalls of Saco, Androscoggin of Lewiston, Cumberland Mills nine, Deering nine, Bowdoin College nine, White Stockings, Sebascons of Gorham, and one other. The first prize is \$100; second, \$50. An additional prize of \$30 or \$40 will be offered to be played for by the Resolutes of Portland and the winning nine of the tournament.

—On July 19th the Robert E. Lee nine defeated the champion Lone Stars at New Orleans by the small score of 3 to 0 in a nine-innings game. This is the best amateur game of the season thus far, the Southerners bearing off the palm over the Northern nines.

—The Louisville Eagle Club whipped the Probasco nine of Cincinnati July 17th at Louisville by a score of 11 to 2.

—The games thus far played by the Athletics on their Western tour, so far as heard from, are as follows:

July 20—Atlantic vs. Maple Leaf, at Guelph..... 15 to 1
July 21—Atlantic vs. Red Stockings, at St. Louis..... 27 to 2
July 22—Atlantic vs. Chicago, at Chicago..... 8 to 10
July 25—Atlantic vs. Chicago, at Chicago..... 4 to 17
July 27—Atlantic vs. Chicago, at Chicago..... 2 to 13
July 29—Atlantic vs. Chicago, at Chicago..... 4 to 5
July 30—Atlantic vs. South Bend, at South Bend..... 31 to 6

They are to visit Louisville, Ky., this week, and they will return home by Saturday.

—The croquet match played at Fairmount Park on July 28th was won by the Philadelphia party, who defeated their West Philadelphia opponents in two games out of three.

—A base ball match will be played next Saturday at Prospect Park between the Wyncoop & Hallenbeck nine and the Harper Bros. nine. Last Saturday the base ball nine of the *World*, and the *Journal of Commerce* nine, had a contest at Hoboken, the latter winning by a score of 32 to 18.

—In a match of base ball played at Boston October, 1868, between eight of the English professional cricketers—with George Wright to captain and help them—and an amateur nine, the amateurs won by the appended score:—

American nine.... 3 2 0 0 1 6 3 5 0—20
Cricketer's nine.... 4 0 0 0 0 0 0 0 0—4

In the latter nine there were Jupp, Shaw, Tarrant, Humphrey, Pooley, Charlwood, Rowbottom, and Smith. This is a sample of what the English professional cricketers did in base ball.

—The Maple Leaf Club of Guelph, champions of Canada, have this season defeated every amateur nine they have played with, both in the States and Canada.

For Forest and Stream.

ELEGY

ON THE DEATH OF A FAVORITE HORSE.

BY WAYNE HOVEY.

RECEIVE, cold earth, a favorite's dear remains,
Consigned with grief to everlasting rest;
And if with printless tread he press'd thy plains,
Lay lightly, greenest sward, upon his breast.

The noble blood of many a generous steed
Flash'd in thine eye, and glowed in every vein;
Thee oft the fairest hands did deign to feed,
And smooth the tresses of thy flowing mane.

No braver steed than thou—though princes led
Hector's proud courser in the camp of Troy—
Thou to soft peace and gentle deeds wert bred,
To bear thy master with a conscious joy.

Here do I strew around thy grassy tomb
Each leaf and flower of melancholy hue,
And weep in fond remembrance of thy doom:
No more excess of love and grief can do.

Fish Culture.

This Journal is the Official Organ of the Fish Cultur-
ists' Association.

FLASHES FROM THE "BLUELIGHT."

THIRD WEEK.

THE week's work has, I believe, been considered by the naturalists as productive of most satisfactory results. The dredge and trawl have, as heretofore, brought to bottle specimens of both northern and southern fauna, and this same peculiarity extends to the sea weeds, plants, and mosses.

We have made two visits to a deep hole in the "Race," just to the westward of Fisher's Island. Although unknown to the fishermen hereabouts, the depth of the water is marked in the coast survey charts as upwards of seventy fathoms, and we have struck fifty-five fathoms, but our work so far in it has not been very paying. The swift running of the tide, and the excessively irregular nature of the bottom, fouled our dredges, and but for the quick tell tale of the check stop we would have soon lost our apparatus.

The temperatures of the bottom water in these deep localities are considerably lower than in the shallow waters of Fisher's Island Sound. In fifty fathoms it was 58°, and in forty-five fathoms 57°, while in Fisher's Island Sound, at the depth of seven or eight fathoms, it is usually 62° to 64°. The temperature of the surface water in this region, at this season, varies from 63° to 68°, according to the weather, time of day, state of tide, and direction of the wind.

The fauna of the deep waters near the "Race" is decidedly northern, and much like that of the coast of Maine in many respects. Several northern species were obtained during these trips which had not before been found south of Cape Cod. Among the Arctic species found here were two handsomely colored shrimps (*Pandalus annulicornis* and *Hippolyte pisida*); many kinds of annelids, among which *Nereis pelagica* and *Aphrodita aculeata* were conspicuous, and the beautiful green *Phyllodoce Greenlandica* was a new addition to the fauna of southern New England.

The assumption that the brackish waters in this vicinity would furnish much information in regard to the young of fishes has been realized, and the Fish Commission has become a feature of interest—skinning, dissecting, bottling, hatching, are going on most of the twenty-four hours, and the huge ice chests present a motley array of odd fish. Every smack that comes in from a trip brings us something new. Among the acquisitions has been a fine short-nosed sturgeon (*Acipenser brevirostris*), measuring nearly eight feet in length. The usual post mortem was unavoidably delayed, as he persisted in retaining life for three hours after he had been transferred from the smack to the wharf. This enormous fish seemed to have a delicate appetite as to quality, though not as to quantity, for he had made his last dinner on about a bushel of a little amphiod (*Ptilocheirus pinguis*), a russet-clad crustacea not more than a third of an inch in length. The sturgeon is a sluggish, slow going animal, and it must have been a labor of time for him to collect his locker full.

Another not common fish brought in was a specimen of the "orange file fish" (*Ceratocanthus aurantiacus*), a flat fish with remarkably large eyes, and of a bright orange color. This fish was a three days' wonder to the New Londoners, and to the fishermen was entirely new. Professor Baird, however, classed it at once, having procured a number of similar fish at Wood's Hole three years ago. A hammer headed shark proved quite a curiosity.

No blue fish to any amount brought in, and few mackerel.

Mr. Fred. Mather arrived here from Holyoke on the 23d with a tin can containing some 20,000 young shad, and began a series of experiments of mixing salt and fresh water, and placing the shad in the mixtures. Those placed in pure sea water died that night; those in water three parts salt lived some twenty-four, some forty-eight hours, and a few till the third day, which finished them. Others, when the water was fresher, stood it longer; but one little fellow alone, which had been in the salt water, then taken out and carefully brought up in (not on) a bottle of fresh water by a young lady, through her extreme care held out until this A. M. (28th), when the "last run of shad" was exemplified in his case. He stood on his head at the bottom of the bottle, and gave no responsive wriggle when touched. Mr. Mather also, with Professor Baird, Professor Goode, your correspondent, and others for spectators, visited a large fish car, in which some 1,500 black fish were confined. After many fruitless dips with the scoop net, which came up full, but empty, he succeeded in procuring a small quantity of spawn, which, having been impregnated in the usual manner, adopted in rearing shad and salmon, was cared for; but the result was not a success, and Mr. Mather hardly had hoped that it would so prove, for the fish had been long confined, as the bruised condition of their fins indicated, and had nearly spawned out. We hope for better luck next time.

The eggs of the black fish are, Mr. Mather says, the

smallest of any he has ever seen, being so fine that our finest hatching boxes would not confine them. The eggs of the "mummy chug," a fish three inches long, were ponderous in comparison with those of a five pound black fish. These experiments can neither of them be considered entire failures. Points were learned in each case that in future experiments will carry us farther on, and if, as it may prove, it is eventually found that sea fish can be artificially raised, and that young shad can be supplied from the sea with proper water, thus making much simpler the task of transporting them to Europe, the record of this, the first known experiment in either, will possess an interest.

The sandy coves about Noank produce great numbers of eels, and an expert, Mr. Latham, spears from fifty to one hundred weight per night, and once, in two successive nights, he procured upwards of 1,000 pounds, netting him a handsome sum. With all of his experience, though, for years among the eels, Mr. Latham is no wiser than the rest of us on the vexed points as to whether eels have sex, are viviparous or oviparous.

From the pound yesterday we procured a full grown roe shad. As the shad is presumed to have ascended the rivers and spawned two months ago, this is looked upon as a phenomenon.

A good sized blue shark occupied the post of honor on the dissecting wharf for a day last week. Divesting ourselves of all prejudice, a fair sized piece, which looked nice, was prepared with William's utmost skill, and served by itself, with various sauces, on the "Blue Light's" dinner table. The unanimous vote was that, although not bad, it was not good. The meat was coarse and dry, and had very little flavor of any kind. So we don't hanker after any more shark.

On the 25th a very pleasant little regatta took place, the contestants being sloop and cat boat yachts belonging to the post. The race was dead to windward and return, and the pennant was won in good time by the sloop "Watson," R. Palmer, closely pressed by the cat boat "Ally," the latter just launched, and named in honor of an important member of the commission. As both first and second boats were built by the same builders, Messrs. Palmer & Duball, selected by Mr. Bennett to lengthen and put new bows on the Dauntless, their performance was, as was to be expected, most creditable.

On Tuesday the Brooklyn yacht squadron passed out from New London, bound to the westward, and presented a fine appearance.

In the laboratory the microscopic investigations have been carried on with many interesting results. One of the most interesting tables in the laboratory is that of Professor Hyatt, who is making a special study of sponges. The popular idea in regard to sponges is, to say the least, rather mixed up. That they come from the sea all know, and that they were once living animals many know—but in what shape or form that mass of honeycombed texture could have supported life was an unsolved problem. The microscope of the Professor, and his clear explanations resolve the mystery. As torn from the rock or shells at the bottom of the sea, on which they make their home, the sponges present a very different appearance from that in which we are familiar with them. The ordinary sponge, as seen everywhere, is but the skeleton not of one, but of millions of animals—the countless orifices on its surface, but the exit openings of an elaborate network of canals and channels, each communicating with all others, and all lined with countless minute animals of a cellular nature, whose secretions form the sponge, and who, by the unanimous action of hair-like appendages called *clitae*, draw in the sea water through orifices not visible to the naked eye, and with it the food upon which they subsist, animalculæ still smaller than themselves. In them we find confirmation of the poet's lines, that "Great big fleas have little fleas," &c. The refuse of their food is carried on from channel to channel, each growing in size by the junction of others, as in a brook-fed river, until at last ejected from the large, exhalant orifices. A coating of liver-like flesh, soft and non-elastic, covers the skeleton; this is removed by maceration in water in the species which are preserved for commercial purposes; and in them is of a horny or keratose nature. The sponges found on our coast represent several families, none of which, however, are free from silicious or calcareous spicules, which renders them useless for the ordinary purposes for which a sponge is required, and which those brought from the Red Sea, Mediterranean, or West Indies fulfil. Certain forms on our coast, however, as the *Chalina arbuscula*, and one or two others, have a network of the horny substance connecting the spiculæ, and therein more nearly approximate to the West India sponge, in which there is no trace of the silicious spiculæ. A form found in Martha's Vineyard, the *suberites*, a flat, yellow mass, is so covered with these flinty needles that on pressing one in the hands a decided pricking sensation is experienced.

The most interesting of the true silicious sponges is the *Cliona sulphurea*, which attaches itself to dead shells, frequently the clam shell, penetrates entirely through in countless places, until the shell is completely honeycombed, and the large exhalant orifices protrude on either side, and around this solid basis it grows to be a great yellow mass, looking little like a sponge to the fishermen who frequently haul it up on their hooks. Few have any idea as to the great variety of sponges to be found on our coasts. We have this season collected over a dozen varieties, one or two of which are entirely new, and over a hundred varieties have been recorded as natives to the New England coast by this and preceding dredging parties. PISECO.

SHIPMENT OF YOUNG SHAD TO BREMEN.—We had on Tuesday last a flying visit from our much esteemed friend, Fred Mather, Esq., just from Holyoke, Mass., en route for Bremen, having in charge 100,000 young shad fry (hatched on the 4th of August). These fish are consigned to the *Deutsche Fischerei Verein*, and will be delivered to Prof. Peters of Berlin. They are sent by Prof. Baird, United States Commissioner. The spawn came from Holyoke. The nursery improvised for the young shad on board the Donau, consists of two iron tanks lined with cement. The steamer carries 10,000 gallons of water. Though the chances are against the enterprise, if it is in the fish "to go through" Mr. Mather is the man to take care of them. The Donau left on Wednesday. This shipment of American shad marks an important event in fish culture. Mr. Anderson of Maine, will accompany Mr. Mather.

Natural History.

DO ALLIGATORS SWALLOW THEIR YOUNG?

Prof. Brown Goode, having settled the question that snakes swallow their young, Col. C. G. Forshey, of the New Orleans Academy of Science, from ocular demonstration, asserts that alligators do the same thing. Colonel Forshey states that in 1843-'44, when surveying the banks of Lake Homochitto, he started a litter of young alligators; they scampered off, yelping like young puppies, and sought refuge in the mouth of a five foot alligator. Referring the matter to Prof. Goode, he has very kindly sent us the following letter:—

HEADQUARTERS U. S. FISH COMMISSION, }
NOANK, Conn., July 27th, 1874. }

EDITOR FOREST AND STREAM:—

The item you send me giving the observations of Colonel Forshey on alligators, pleases and interests me greatly. I had never before heard that alligators are supposed to "swallow their young," though there appears to be no *a priori* improbability in it. The female alligator is known to cherish its brood very tenderly. After depositing their eggs in their great haycock-like nests of mud and grass, and breaking down the dense growth of reeds surrounding into a sort of *abatis*, to prevent the approach of enemies, they watch the eggs until they are hatched, take the young in charge, defend them and provide for their subsistence.

Nearly all the North American snakes which produce their young alive, some of the egg-laying species, and what more particularly concerns this case, one species of lizard (*Zootoca vivipara*) are known to shelter their young in their throats: why not the alligator?

The scientific reputation of Colonel Forshey is too well established to permit us to question the accuracy of his observations, and in this case his eyes could hardly have deceived him; still, it would be gratifying to have the nail of evidence clinched by the statement of other witnesses especially so to hear from some one who has seen the young alligator come out of the mouth of the dam. Yours very truly,

G. BROWN GOODE.

THE PTARMIGAN OF NEWFOUNDLAND

EDITOR FOREST AND STREAM:—

The Ptarmigan or Partridge ("partridge," in our local vernacular) of Newfoundland are quite equal to the Scotch grouse, and indeed resemble them so closely that it is difficult to make out any specific difference between the red grouse, gorsecock, or moorcock of Scotland, and the ptarmigan of Terra Nova. They are a most delicious article of food, whether roasted, stewed, or in white soups. All visitors to our shores admit that the flavor of a plump partridge, well cooked, is unsurpassed in richness and delicacy. They are of respectable proportions, a brace of them in season weighing from three pounds to three pounds and a half. When the sporting season opens, on the 1st of September, they are in prime condition, after feeding on the wild berries, the partridge berry and cranberry being their favorite food. In certain localities they are very abundant, and to the sportsman there can be nothing finer than a day's partridge shooting over our breezy "barrens," during the fine autumn weather. The air is then cool and exhilarating, and the bright skies, the weird and charming scenery, varied by countless lakes or "ponds," as we call them; the low, rounded hills, covered to the summit with the tapering firs; the lakelets bright with the white and yellow water lilies; the bold headlands along the coast through whose summits glimpses of the restless Atlantic are obtained—all these, with the excitement of the sport, combine to furnish to the lover of nature a day of rapturous enjoyment. It is a thrilling moment to the genuine sportsman when, gun in hand and dog at foot, he finds himself among the partridge coverts. His faithful Rover scents the game; every nerve in his frame quivers as step by step he thoughtfully and cautiously advances toward the unseen cover: then suddenly pausing, the right fore paw balanced lightly, and every limb and muscle rigid as a statue, the beautiful animal is at once transformed into a marble Niobe. Presently a whirr is heard, and with a loud "ca, ca, ca," a magnificent old cock rises on the wing. Crack goes the gun and down tumbles the great bird, the scarlet tips over his eyes glistening like rubies, as with a thud that gladdens the sportsman's heart, he strikes the earth. Or perhaps a whole family—father, mother and children—rises at once, and the double barrels bang at them right and left, bringing down two or three brace. At times a late cover is raised, the chickens of which are only two or three weeks old, just able to run smartly along the ground. It is a touching sight then to see the cock fearlessly exposing his life to save the lives of his offspring. He tumbles along the ground a few yards in advance of the dogs, rolling there in order to decoy the sportsman from the brood which the hen is anxiously calling into the thicket. No more touching instance of paternal affection could be witnessed; no more touching proof among the lower creation of self-sacrifice, prompted by love. The poor feeble bird would almost attack dogs and men in his efforts to save his children. No true sportsman would harm a bird under such circumstances. Only a brute would fire upon it. The dogs are called off, and father and mother ptarmigan are soon rejoicing over their rescued family.

After a day's sport over the hills a supper of roast ptarmigan, with wild strawberry tart as an accompaniment, and trimmings composed of our sweet garden vegetables, is "a feast fit for the gods." Our ptarmigan have in summer a plumage brownish ash gray in color, mottled and barred with dusky spots. This color, when the frost sets in, gradually disappears, as in the Alpine hare, and at length when the snow falls it is almost pure white. One peculiarity, however, in the Newfoundland bird is, that the middle or incubent pair of tail coverts are rarely found entirely white in winter, as they are stated to be in "Birds of North America," p. 634. These remarkable changes, effected as in the northern hare, without loss of substance, fit it admirably for its situation; as the sportsman, if he have not a dog used to the game, may almost walk over the bird without putting it up. It is feathered and haired down the legs and between the toes, and may be distinguished at a considerable distance by the red about the eye. These birds are widely diffused over the island and it is no uncommon thing for a sportsman to bag in a day from a dozen to twenty brace.

There can be no doubt that our ptarmigan are the Willow Grouse (*Lagopus albus*) of naturalists, and they are the only lowland or sub-Alpine species indigenous to Newfoundland. Their food mainly consists of the buds and tender shoots of birch, alder, black spruce, juniper, &c., but in the berry season they feast on partridge berries and cranberries. They almost invariably roost on the ground, but are often shot feeding on the tops of birch and alder trees. Professor Baird says: "I find a considerable difference in different specimens of the large ptarmigan (*L. albus*) before me. Those from Eastern Labrador and Newfoundland appear to have decidedly broader, stouter, and more convex bills than those from the Hudson's Bay and more northern countries. I think it not improbable that there may be two species." Professor Newton of Cambridge is, however, of a different opinion. He says: "None of Professor Baird's later writings have gone to strengthen the suspicion expressed by him formerly as to the existence of a second species of willow grouse. I have compared a pretty good series of skins from many parts of North America, extending from Alaska to Newfoundland, and so far as I can judge I have no doubt they are of one and the same species, which is further identical with the willow grouse of Europe. *Tetrao saliceti* (Temmick); *T. subalpinus* (Wilson)."

At times, in some districts, they are so tame that they can be killed with a stick, and at others so wild that they will not allow you to approach within gun shot, and such is generally the case in winter, when

the snow is hard and crusty, and the noise made in approaching them alarms them. They are shot at all times by our population in the more distant districts, but a close time is now fixed by law, which will have a good effect where the law can be enforced.

There is another species found in Newfoundland, but it is comparatively rare—the Rock Ptarmigan, *L. rupestris* (Gmelin). It is a truly alpine species, and is seldom found below the line of stunted black spruce except in the depths of winter, when they descend to the low lands and feed on the buds of dwarf trees, sometimes in company with the willow grouse. Our settlers call this the "mountain partridge." M. H.

THE SCENT QUESTION.

Nicasio, Marin co., Cal., July, 1874.

EDITOR FOREST AND STREAM:—

In an article in a back number relating to quail withholding their scent, I expressed the opinion that sitting birds gave off no scent. In making this statement I had reference to the California quail, which is about the size of our eastern quail, but differs from it in plumage and somewhat in habits. The California quails, both male and female, have a plume on the top of the head which can be raised or depressed at will. Their plumage is of a slate color, and unlike our eastern quail, they roost in trees at night. They are very prolific, laying about nineteen eggs, often more. I have seen twenty-seven. The nest is made in the ground and lined with fine grass. The bird, when sitting, is about level with the surface. The eggs are placed around the sides of the nest. During incubation the birds lay very close, sometimes being killed by cattle stepping on them. A bevy, on being flushed, alight together, but are easily flushed a second time, when they scatter and lay well if the cover is good. I never had trouble in finding them as soon as I could get to them, if there was any dampness in the air; but in our dry, north wind the scent from some cause is so soon obliterated that I have often seen dogs flush quail by walking over them, and even stand with their foot on a dead bird, at a loss to know what had become of it. But the same dog, on a damp day, would work out and retrieve five hundred and fifty quails. Having kept good dogs during many years, and never having seen one make a point on a sitting bird, I formed the opinion that there was no scent given off that a dog could detect.

I trust my brother sportsmen will receive this in the true spirit of a sportsman, remembering that the best dogs can be at fault and the finest shots miss their birds, and that in all matters of opinion such as this, no one can be positive. Yours truly, PIONEER.

THE "RARA AVIS."

EDITOR FOREST AND STREAM:—

A Western friend writes me as follows regarding the "Rara Avis" of "Pioneer," in FOREST AND STREAM of July 23d:—

"This story is rather a hard one to digest, but I think I can solve the mystery. What he found was either the nest of *Podiceps Californicus* (Heerman) or of *P. occidentalis* (Lawrence), which species always breed in close proximity to water. These nests were probably floated off during high water, became partially submerged, yet retained sufficient buoyancy to prevent being sunk entirely. These birds, upon leaving their nests, generally cover them up, as he says he found them. The eggs of all grebes, so far as my observation extends, are of a dirty white color, but entirely different in shape from quail's eggs. While the latter are pyriform, those of the former are of an elongated oval, considerably and equally pointed at both ends."

As my friend has collected and studied the oology of North America (especially of the little known Western region) for years, and has the best private collection in the Union, I attach full credence to his statement. FRED. BEVERLY.

A Minnesota correspondent, Mr. Franklin Benner, agrees with the views of Fred. Beverly given above. He says:

"The nest discovered by your correspondent 'Pioneer' is no doubt that of one of the species of grebe, probably that of the red-billed grebe. It is not built under water but on the edge of the pond, where, after a while, it may have become detached and water-logged, which would account for the position in which it was found."

CENTRAL PARK MENAGERIE.

DEPARTMENT OF PUBLIC PARKS,
NEW YORK, Aug. 2, 1874.

Animals received at Central Park Menagerie for the week ending August 1, 1874.

One red-throated Amazon, *Chrysotis collaria*. Hab. Jamaica. Received in exchange.

One Grevet Monkey, *Chlorocebus enyithia*. Hab. Abyssinia.

One Marsh Hawk, *Circus Hudsonius*. Presented by James S. Bailey, M. D.

One Night Heron, *Nyctiardea gardeni*. Received in exchange.

One Killdeer, *Aegialitis vociferus*. Received in exchange.

One Woodchuck, *Arctomys monax*. Presented by Mr. Charles M. Schleffelin.

One Red Fox, *Vulpes fulvus*. Presented by Mr. Spencer G. McNary.

Three Monkeys. W. A. CONKLIN.

Woodland, Lawn and Garden.

ANSWERS TO CORRESPONDENTS.

THE ELM FLEA.—A correspondent in Harlem asks, "What are the little hopping fleas, or bugs of a golden and green color, that cover my elm trees?" We have seen nothing of the kind of insect of which our correspondent speaks, but we think he confounds his unknown "skipping insect" with one equally familiar to us, and known as the "elm flea." The elm, however, is subject to many and some very curious diseases, as every patient observer and student of trees knows, and to some of these diseases these true enemies come as to a feast of fat things. Sometimes an unusual deposit of combrium takes place, and instead of forming—as it should were it to follow a great law of nature—the new wood, it becomes unhealthy, and oozes out through the bark. You will know it from its black appearance after a few days; first a thin, white, sweet substance is formed, and then swarms of insects come as to a feast to eat this sweet substance. And here we always find the insect you seek information concerning. He is a perfect glutton at the sap, and covers the green leaves of the elm in thousands. It is a beautiful little insect to look upon, exceedingly lively, and from its habits of leaping has had the name of "elm flea" conferred upon it. I have seen whole branches covered with these little gold and green fellows, and presto! in an instant there was not one to be found. They devour the leaves of the elm, but are of no serious injury to the tree. In the first stages of their existence we find them, under the lense of a good microscope, to be a small, slender grub, deriving their food from the leaves upon which they are hatched. These grubs are hearty eaters, and are in manner not unlike the hopping gold bugs.

There is also a species of *Cynips* which punctures the elm leaf, and feeds upon a liquid oozing from such puncture; then there is the caterpillar and a beetle, resulting

from a very undesirable grub, who, when he has grown to mature beetleship, is truly named "destructor," on account of the havoc he sometimes commits on some species of the elm. But as we have answered our inquirer as to the nature and character of the insect of which he speaks, we offer no more at this time upon this curious depredator, simply saying to our friend, let him go, there is no kill to him. OLLIPOD QUILL.

F. C. MORSE, Ohio.—You can eradicate moss from your lawn. In the first place your lawn must be well sheared—rake lengthwise and crossways. This will detach the moss. Roll with as heavy a roller as you can obtain, in wet weather. In the spring sow of nitrate of soda 200 weight per acre, or you can use finely sifted coal ashes in about the same proportion, and you will not be at all troubled with moss.

O. Q.

ELLA, Rome, N. Y.—Almost any well drained soil will grow the fig tree. If your ground is too rich it will not perfect the fruit. But little difficulty attends the growing of fine figs if you are only careful. The three sorts of figs best for our cultivation are the Brown Turkey, Brunswick, and Black Ischia. Place any of these plants near a wall, in a good sunny situation; train perpendicularly, and keep them well thinned. Stop the growing of the shoots the 1st of September to throw the sap into the fruit. O. Q.

ALFRED PHILLIPS, Penn Yan.—The pest from whose ravages you seek a remedy is not new to experienced agriculturists—it is the old gooseberry caterpillar, and often all the leaves of the bushes are destroyed by them. Do not be discouraged. Up and at them. These caterpillars come from a "saw fly," so-called, which lays its eggs in rows along the under sides of the leaves, and after having eaten their fill fall to the ground, where they live in the pupa state until the next spring. The bushes should be very carefully examined once in each week to watch the hatching of the eggs, when you can easily pick off the infected leaves. Now you are to dust all over leaves powdered hellebore, or make a strong decoction of the digitalis, or fox glove. I have "used them up" with both these remedies. When the caterpillar works rampant you will stop him short in his career if you will give your ground a good sprinkling with new lime. O. Q.

AGRICULTURIST, Newbern, N. J.—Your enquiry as to the discovery of an insect as the cause of the disease in the potato, causing it to rot, is correct. After a series of some sixteen years of very careful study and observation with the microscope, I have solved the mystery of the disease in the potato. To answer half your enquiries as you request, through the FOREST AND STREAM, would occupy too much space, and we can only do so by personal letter, which we will do if you desire. O. Q.

The Kennel.

A VISIT TO FOX FARM.—Motto: "Not caught yet."—We paid a visit last week to Fox Farm, Morris Plains, New Jersey, the property of Mr. Raymond, in order to inspect the two Laverack dogs recently imported by him. Fairy had born to her about three weeks ago eight puppies, five blue and white Beltons and three lemon and white. These pretty little beauties are now receiving the care of their well-bred and really handsome mother, but as she was in no condition for a critical inspection, we will defer it until a later period. Mr. Laverack wishes Mr. Raymond to send back to England one of the lemon and white pups as soon as it is able to bear the long sea voyage, for which he will pay him a good round sum. Pride of the Border looked in fine condition; his color is liver and white, not a large sized dog, head handsome and intelligent, chest fairly deep, his coat and feathers delicately fine, his quarters and stern set on right, and his loins by no means narrow. His ranging powers are excellent; he carries his head well up, and has got that extraordinary curve on the inside of the hind legs which gives him an easy, light way of moving, and apparently without fatigue. This is all very proper for the show bench. If he is as good over game in the field as he looks, (and we have no reason to doubt it,) then we say he is a fine specimen of his race. In a week or two we shall give the portraits of these dogs from life, sketched by a distinguished animal painter, when the public can form their own opinion. We take this opportunity of thanking Mr. Raymond for his courtesy and hospitality; also that genial gentleman and sportsman, Mr. Mather, who is the uncle of the practical fish culturist, Mr. Fred. Mather.

—The sale of the late Francis Butler's kennel, (who, it will be remembered, died recently of hydrophobia,) of sporting and non-sporting dogs, took place last week in Brooklyn. The animals were only a fair average lot, and fetched poor prices. There were some 150 lots in all, including several coops of poultry. The following are some of the principal lots:—White bull \$9, brindle and white slut \$9.50, orange and white Springer \$11, black Newfoundland \$10.50, black Siberian slut \$7.50, black and white Bloodhound \$8, black Newfoundland \$14, Scotch shepherd \$16, dark blue Scotch terrier \$20.50, silver and blue Skye \$20, silver Skye \$19, black and tan Gordon \$18, silver and blue truffle Skye \$19, English fox terrier \$19.50, Irish wolf \$17.50, liver Cocker spaniel \$17.50, blue Scotch terrier slut \$15; a case of stuffed dogs sold for \$16, and a case of English hedgehogs for \$6.50; one live two-legged tortoise shell cat brought \$2; two great stuffed Siberian bloodhounds, "The Princes," sold for \$50 each; a brood of English golden pheasants sold for \$9, and two coops of golden pheasants for \$9.75 and \$10 respectively. The entire proceeds of the sale amounted to \$1,250.

—Messrs. Tattersall, of London, England, sold the entire kennel of dogs belonging to Mr. R. Garth, Q. C., on the 14th of July. Of the twenty-seven lots only one was absent, and the remainder realised the large sum of \$3,500 in gold,

or an average of \$135 each. The celebrated pointer Drake, one of the best in England, was knocked down to Mr. Price, of Bala, for \$750 in gold. This gentleman also purchased eight other pointers and setters, and may congratulate himself of having in his kennel by far the best brace of pointers (Belle and Drake) that ever appeared in a public field trial.

—The Tennessee State Sportsmen's Association are to give an exhibition on the bench, of pointers and setters, also a field trial. This show of dogs will take place at Memphis in October, and we trust that the committee are convinced of the importance that certain points, laws, rules, and regulations which all exhibitions endorse, will be strictly adhered to, and that there will arise no complaints or personalities afterwards. We are sorry to add that these unfortunate criticisms of the judges and owners of dogs in field trials and on the show bench have become so fashionable in England of late that several journals have refused to publish anything that does not bear directly in the interests of the public.

—In *La Chasse Illustrée* we find the following interesting facts as to dogs in France: There are about 200,000 dogs in the whole country, and in Paris about 70,000, which pay a tax of 635,000 francs. For 1874 the duty on game in Paris alone will furnish 4,000,000 of francs to the budget. It seems then that Paris will receive this year from taxation on dogs, from the right to carry arms for meeting purposes and for duties on game, as much as a million of dollars.

JUDGING ON THE SHOW BENCH.—No. 3.

THE DALMATIAN.

HEAD long and in appearance between the pointer and bull-terrier head, with a long jaw; ears fine and pendulous, but not long; eye prominent; neck long; shoulder a little wide; deep chest; back long, but not so deep in ribs as a sporting dog; good straight legs; stern fine, carried off to a point; body color white, with at equal distances a round black spot about the size of a shilling or a little larger all over the body; head and tail fine and evenly spotted, the two colors not running into each other; liver-colored spots are just as admissible as black, but colors running into each other, or mixed, are a great fault.

POINTS IN JUDGING.

Head	15	Feet	10
Back	15	Color	25
Loins	15	For marks on head and tail	
Legs	10	5 each	10-100

THE SHEEP DOG OR COLLEY.

The head has a great resemblance to a wolf's—being rather conical, and going off gradually sharp to the nose, with a long jaw—only longer, and with a more foxy and intelligent look, and wider and longer ears, which are a little feathered and pendent; eyes have a sort of flashing and "miss-nothing" look, always on the alert; jaw long; nose sharp; neck long, and well furnished with apron and ruff; shoulders fine and deep; chest well let down; legs straight and full of muscle, with cat-like feet. A good broad back and thick over the loins, with well-bent hocks; stifles well developed; tail feathered, not carried over the back; coat long and straight, wiry to the touch, with a pily coat underneath the "over-coat." Color various; but that most in vogue, black-and-tan, the tan to be pale, not rich. This is the present fashionable show-dog.

POINTS IN JUDGING.

Head	25	Loins	10
Neck	5	Coat	15

Chest	10	Feet	10
Back	10	Stern	100

THE BLOODHOUND.

Head large, slightly conical; forehead long, inclined to be narrow; eyes brown and sunk in the head, but expressive, showing how very plainly, which causes it to have an appearance of redness; the ears very long, well spread out, and nicely turned, and not puckered, fine in texture, in excitement they ought not to be carried up, but to hang tolerably near to the face; upper jaw and face inclined to be narrow; flews thin and pendulous, almost so that they could meet under the chin. The neck proportionately long; the skin on the throat loose, slightly wrinkly; shoulders powerful, not upright, but blades slightly slanting; what we mean is, not straight from the foot to front of shoulder; deep chest; fore-legs muscular and straight; feet round and cat-like; back not too long, thick, powerful, and well ribbed up, short in loin; hind-quarters well set on, well furnished with good muscle; stifles not too long, but plenty of substance; stern set in level with the back-bone, pliant and tapering to the point, feathering or coarseness a great fault. Color reddish tan, darkening into black as it reaches the back. Some breeds show the body white flecked, which many old breeders very much admire. The coat should be short, glossy, and lie as close as a thoroughbred race-horse's; patches of white on chest or feet are objectionable; height in bitches 27 inches, dogs 29 inches, but two inches over those heights, if proportionate, would rather be an advantage. Judging is not tied only to these points, as there is a something in sight you cannot define, but can act on; but, as a whole, this we consider a pretty fair description of the main items of a good animal.

WESTERN CHALLENGES TO ENGLISH SPORTSMEN.

PHILADELPHIA, July, 1874.

EDITOR FOREST AND STREAM:—

Perhaps our Western friends who have come forward so boldly in their challenge to English sportsmen for a trial of the respective merits of the dogs of both countries, may not know that the simple first finding of a pack of grouse is not all that is required of a setter in order to give him the foremost position and prize in a field trial. All such matches

are run under an established code of rules and scale of points, such as was given not long since by the field editor of the FOREST AND STREAM.

I would advise ambitious sportsmen wishing to enter a dog in such a trial, to be sure they are right and then go ahead.

Things may not be as they once were, and those who throw down the gauntlet may not have seen the setter or pointer they wish to march for some time, to know if they had not gotten into bad habits, such as breaking shot, running rabbits, &c. For these shameful errors, no matter how good the nose may be, will surely count sadly against the animal committing them.

Let us have first a trial of merit at home, to see who really may have the representative dog of the United States. There are owners of setters, I am sure, who would accept challenges given them to hunt their dogs on all descriptions of game, not merely pinnated grouse, rabbits not included.

I would propose in all trials that each owner be compelled to hunt his own dog, and not turn over the handling to the breaker or a better sportsman than himself.

OBSERVER.

TRIBUTE FROM A LADY.

The following lines from a lady who loves both dogs and flowers will be appreciated by some of our readers:

WEST MILFORD, Passaic county, N. J., July 3d, 1874.

EDITOR FOREST AND STREAM:—

Through the generosity of a Brooklyn sportsman we have enjoyed the contents of your interesting paper, although I am a lady, and am blessed with Bergh attributes, and am inclined to think quail and woodcock much prettier upon the wall (if after Tait) than drawn and upon the gridiron, after some noble setter has pointed them out to his merciless master.

I have another reason for not loving the sporting Prince and Dash. I love the flowers, and have been very grateful to the FOREST AND STREAM for its hints and wise suggestions, and although I do not expect to see my flowers, like those of California, trail from housetops, still I think by reading your paper I have gained much knowledge on the subject, for which I am thankful. And after tending them until their budding glory has arrived, I do not like Dash to plunge among my zinnias, asters, gladiolus, &c., even if imported and worth his weight in gold; and although his master's heel comes forcibly to the rescue of the flowers and poor doggy looks up with an air that says plainly, "See, even in the free, noble country, we are not exempt from the pound!" Of course my sympathies then go to the dogs, and although doggy must fast, not in Lent, but the hunting season, that his master may eat the more, I take a loaf of bread under one arm, a pail of Orange county milk in my hand, and with these noble weapons of dog fare he to some out-building where he may repose until his master thinks he needs more floral exercise.

Now, Mr. Editor, we live near the beautiful lake of Greenwood, quite famous for its pickerel and bass, the only scaly denizens herabouts. Hunting, too, has been very good in the past, but this year we have had scarcely any sportsmen here. The late snows killed the young birds, so they will have to wait later. Now if any of your readers desire the comforts of a pleasant home for their wives and little ones during the heated term, I will board them at panic prices, only asking that they will spare my flowers. I beg pardon if this looks like advertising in the FOREST AND STREAM, and leave it to the consideration of those most interested, and whether it gets in the FOREST AND STREAM, or the chip basket think not that I write merely because I had an axe to grind. Respectfully,

C—F. W—.

The Horse and Course.

—The Society of Agriculture and Horticulture of Westchester County, near White Plains, held their annual meeting on the Fair Grounds on July 30th. Two trots came off. The first trot was for a purse of \$500, for horses that had never beaten three minutes; \$250 to the first, \$200 to the second, and \$50 to the third. Twelve horses started, and H. Casey's r. m. Rosa Sonburg was the winner. The second trot was by horses that had never beaten 2:36, for a purse of \$800; \$400 to the first, \$200 to the second; \$120 to third, and \$80 to the fourth. Mile heats, best three in five. 15 horses started, and the time was 2:37½, 2:35, 2:36, the first prize being awarded to Messenger Boy, second prize to Brown Prince, third to Lady Angie, and fourth to Lady Wood.

—The Utica Park Association will hold their annual trotting on August 11th, 12th, 13th, and 14th. The Association announce a total list of eighty-six entries and the prizes to be competed for is the large sum of \$30,000, with the addition of another \$1,000 given by the Directors for a pacing race, to take place on Friday, August 14th, the concluding day of the meeting. The price of admission will be reduced to one dollar, which includes the full privileges of the field, stables, quarter-stretch and Grand Stand. Gilmore's celebrated Twenty-second Regiment Band of thirty-five performers will give a grand instrumental concert from one o'clock until the horses are called, and play at intervals during the heats. The track is said to be one of the fastest in the world and is in the best possible condition. The entries in the 2:34 class are thirteen, 2:24 class five, 2:45 class fifteen, 2:29 class fifteen, 2:38 class eighteen, 2:26 class five, 2:31 class twelve, 2:20 class four. All the connecting railroads will carry passengers at reduced rates, and after the races special trains will leave the Central Depot in all directions.

—At Mendota, Illinois, on the 18th, 19th, 20th, and 21st of August, the annual meeting of the Mendota Driving Park Association will take place. There will be thirteen premiums offered, and among the races will be included an old fashioned quarter race and a slow mule race. Officers of the Association are T. L. Carnahan, President, C. T. Taylor, Vice President, T. F. A. Newport, Secretary.

GREASING BUGGIES AND WAGONS.—Greasing buggies and wagons is of more importance than some imagine. Many a wheel is ruined by oiling too plentifully. A well made wheel will endure constant wear from ten to twenty years if care is taken to use the right kind and proper amount of oil; but if this matter is not attended to, the wheel will be used up in five or six years, or it may be sooner. Lard should never be used on a wagon, for it will penetrate the hub and work its way around the tenons of the spokes and spoil the wheel. Castor oil is a good material for use on iron axles; just oil enough should be applied to a spindle to give it a light coating; this is better than more, for the surplus put on will work out at the ends, and will be forced by the shoulder and nut into the hub, around the outside of the boxes. To oil the axle-tree, first wipe the spindles clean with a cloth wet with turpentine, if it doesn't wipe without it. On a buggy or carriage, wipe and clean off the back and front ends of the hubs, and then apply a very small quantity of castor oil, or more especially prepared lubricator near the shoulder's point.—*American Patron.*

Yachting and Boating.

All communications from Secretaries and friends should be mailed not later than Monday in each week.

—The cruise of the Brooklyn Yacht Club this year has been an unqualified success, with everything that could be desired in the way of weather and a superb fleet of vessels. The runs from port to port have been a succession of the most delightful regattas. On July 30th a gale struck them at Martha's Vineyard, but all got safely under shelter and no accident occurred. The weather cleared after a few hours, and a fleet of cat boats having been provided, such of the yachtsmen as felt disposed, went trolling for bluefish off Cape Poge. During the cruise of the fleet the time has been passed in the most enjoyable manner, on sea and shore. The Comet had a jolly time at Edgartown, as may be imagined. On the 30th there was a hop at Oak Bluffs. The club has now disbanded and the yachts have scattered to the eastward and westward, and some have returned home. The Commodore's cups, contended for in a splendid breeze, were won by the schooner Comet and sloop Qui Vive, and the race completed in the shortest time on record over that course. To sum up, we may say that this cruise has demonstrated the fact that the flagship—the Madeleine, Com. Voorhis—has lost none of her fleetness, though she sailed this season without any kites on board. The Qui Vive is certainly one of the fastest sloops of her inches in the country, and the Sadie has well sustained her reputation as one of Herreshoff's most successful boats. The schooner Comet, modelled by Mr. Philip Ellsworth and owned by Mr. Lanby, has, from her very first aquatic encounter, met with nothing but one uninterrupted list of victories, and of the new yachts so far tested may be said to be the success of the season. We congratulate the club on their cruise now completed, and hope they may have many more in the future equally pleasant.

—The Atlantic Yacht Club, of Brooklyn, rendezvoused at Glen Cove on August 4th, and started on its annual cruise. The number of handsomely modelled vessels lying in Hempstead Harbor presented an attractive picture. The order under which this fleet sailed is appended:—

GENERAL ORDER NO. 2.

FLAGSHIP PEERLESS, NEW YORK, July 10, 1874.

The fleet will rendezvous at Glen Cove Tuesday, August 4.

AUGUST 5.—On signal from flagship will sail for Morris Cove, New Haven Harbor.

AUGUST 6.—On signal will sail for Greenport.

AUGUST 7.—Special orders will be issued for the day.

AUGUST 8.—On signal the fleet will sail in the afternoon for Stonington.

AUGUST 9.—Divine service will be held on board flagship.

AUGUST 10.—On signal the fleet will sail for New Bedford.

AUGUST 11 or 12, as may be decided at New Bedford, will get under way for Vineyard Haven, where further orders will be issued.

All signals for sailing will be the second of two guns, with interval of five minutes.

By order, Commodore MAXWELL.

John B. Morgan, Recording Secretary.

—The New York Yacht Club Squadron assembled at Glen Cove on August 4th, and started on the 5th its annual cruise. The following vessels are at Newport to-day waiting orders:—

SCHOONERS.

Name.	Owner.
Dauntless.....	Commodore J. G. Bennett.
Alarm.....	Rear Com. G. L. Kingsland.
Ariel.....	William L. Swan.
Clio.....	T. C. P. Bradhurst.
Eva.....	Thomas B. Asten.
Fleur de Lis.....	E. Burd Grubb.
Idler.....	J. S. Dickerson.
Josephine.....	S. J. Colgate.
Magic.....	Lloyd Phenix.
Rambler.....	W. T. Garner.
Restless.....	W. H. Thomas.
Tidal Wave.....	G. G. Haven.
Wanderer.....	William Voorhis.
	James Stillman.

SLOOPS.

Fanny.....	C. H. Mallory.
Gracie.....	John R. Waller.
Vindex.....	Robert Centre.
Vision.....	J. J. Alexandre.
Way ward.....	W. E. Morris.

STEAM YACHTS.

Ideal.....	Theodore A. Havemeyer.
Lurline.....	Phillips Phenix.

The schooners Comet, Gypsie, Madeleine, Phantom and Tarolinta, and the sloop Qui Vive, will join in this great aquatic pastime.

—The Stapleton Yacht Club held their seventh annual regatta on July 30th. The course was from a stake-boat anchored opposite Stapleton Landing to the Southwest Spit, and return. Twelve yachts started. The distances sailed were twenty-five miles for first class and twenty miles for second class yachts. Com. Lyman's yacht Elizabeth soon drew ahead of her competitors, and when the turning buoy was reached she was nearly two miles in advance of them. She turned the wrong buoy, and did not discover her mistake till several minutes afterward, when she went back and rounded the right buoy, taking her place again in the race as No. 4. She soon regained the lead, and came in the winner, passing the line six minutes and twenty-five seconds before her nearest rival, the Queen. The Elizabeth is said to be considerably longer than the Maud, and it is expected that the latter will receive the prize by allowance of time. The time allowed for difference in measurement was one minute to the foot for each ten miles. This gives the Queen, which came in second, the third prize.

—The Queens County Yacht Club of Flushing, L. I., will hold their second annual regatta on Thursday the 13th of August. The yachts will be divided into three classes, viz.: first class, cabin sloops; second class, open sloops; third class, cat boats. Time allowance will be given at the rate of one minute for each foot of additional length. The race will be open to all yachts, and the course will be from a point opposite Miller's Hotel at Little Bayside, around Stepping Stones buoy, to a boat moored at City Island, thence to and around stake boat anchored off Throgg's Neck to and around home stake boat, the course to be sailed over twice.

—The Neptune Fishing Club, of Norwalk, Conn., forty-three persons, is at the Vineyard.

—Next Saturday is fixed for the Corinthian Regatta, which is, perhaps, the most important yachting event ever witnessed in the United States or in any country. For, although the credit of originating Corinthian yachting does not belong to us, it is doubtful whether our English cousins have ever sailed ten large schooner-yachts, officered and manned entirely by amateurs, over an open course. Should there be a breeze and no fog, we think we can venture to prophecy as fine a race as was ever witnessed when the yachts were handled by their professional officers and crews. We mean as far as freedom from fouls, errors of judgment and seamanship are concerned. Let full credit be given these *yachtsmen*; for it is no easy undertaking to manage a vessel of perhaps over two hundred tons under all circumstances. The day upon which the race is sailed may prove fine, but these gentlemen accept the chances of any weather, and feel confident that though it should be necessary to reef and handle their vessels in a blow they would be found perfectly equal to the occasion, accepting the wet shirts and possible danger without a murmur. The original list of entries was as given below, but this may be added to still, as the books are open until 4 P. M. tomorrow, the 7th of August. We believe the Foam, however, has changed owners and may not be sailed, at all events not by the original crew. The following are the entries as they now stand:

Yacht.	Owner.	Club.
Madeline.....	Com. J. Voorhis.....	Brooklyn Yacht Club.
Tidal Wave.....	William Voorhis.....	New York Yacht Club.
Foam.....	Sheppard Homans.....	New York Yacht Club.
Azalia.....	Com. J. M. Forbes.....	Eastern Yacht Club.
Tempest.....	James Lee.....	Boston Yacht Club.
Fearless.....	Eben W. Phillips.....	Boston Yacht Club.
Eva.....	E. Burd Grubb.....	New York Yacht Club.
Peerless.....	Com. J. Maxwell.....	Atlantic Yacht Club.
Palmer.....	Rutherford Stuyvesant.....	New York Yacht Club.
Comet.....	Wm. H. Langley.....	New York Yacht Club.
Idler.....	Rear Com. S. J. Colgate.....	Seawanhaka Yacht Club.

SOUTH BOSTON YACHT CLUB.—The third of the series of champion regattas of this club occurred at City Point, South Boston, Saturday P. M. last. The prize for first-class keel boats was decided at the previous contest, on the 17th ult., when the Fearless, Capt. Woodward, was awarded the honor. The second prize for that class is yet undecided, and could not be decided on Saturday, as but one yacht, the Starlight, appeared, and the rules debar a prize when but one enters. The first-class centre boards got a good send off over the prescribed nine and one-half mile course at 2:45, the Naiad Queen and Fannie having a slight advantage to the windward. The following is the result:

FIRST CLASS CENTRE-BOARDS.

Yacht.	Captain.	Sailing Time.
H.	M.	S.
Fannie.....	B. Dear.....	1 45 25
Posey.....	H. J. McKee.....	1 48 05
Naiad Queen.....	W. Kilmer.....	1 49 50
Ripple.....	C. D. Macomber.....	1 52 20

By this table the Fannie won the race, which places her in the same position as the Eva and the Ripple, who had been victorious in previous contests.

SECOND-CLASS CENTRE BOARDS.

Mabel.....	J. H. Roberts.....	1 45 00
Unique.....	James Stewart.....	2 00 00

In two previous contests the Maud, Capt. Fuller, had won and been declared entitled to the prize, which decision has been reversed on account of a reported error of six inches in measurement, against which reversal a protest has been entered and is yet to be settled.

FIRST CLASS KEELS.

Starlight.....	F. S. Wright.....	2 02 00
----------------	-------------------	---------

SECOND CLASS KEELS.

Uncle Moses.....	C. H. Dolbeare.....	2 25 00
Kate.....	C. T. Haley.....	2 27 00

Another race will be necessary to a decision, as the Eva, Fannie and Ripple have each a mark for the first prize, and the Posey and the Naiad Queen for the second. Comdr Robert's yacht Mercury was the judges boat.

BOSTON YACHT CLUB.—At a regular meeting of this club, held last Wednesday evening, it was decided to hold their Annual Regatta on Saturday, September 5th, off their club house at City Point.

Com. Benjamin Dean has this week issued a congratulatory order concerning their late review and cruise, an advance copy of which has been kindly sent us. We regret that our crowded columns will prevent our printing it in full, for it is not only a courteous document, but contains practical suggestions worthy of consideration by other clubs than the one to which they are specially addressed. The Commodore enumerates twenty-four yachts, including the famed America, which sailed on the cruise, and thanks their officers for the enthusiasm which secured so large a representation. He tenders particular acknowledgment to Captain Arthur Cheney for placing his steam yacht Anemone at the Commodore's disposal, and for accepting the position of officer of the day. The neatness and trim, sailor-like appearance of the Tempest is specially complimented. The instrumentality of the "America" in contributing so much to the present status of yachting in this country, is not forgotten. Seamanship, which in some cases has proved as skilful as with professional mariners, is indicated. And finally, the discipline of the club, the attention paid to marine etiquette, and the deference to superior officers, is favorably commented upon. The Boston Yacht Club is rapidly acquiring an enviable reputation.

—The Lynn Yacht Club has arranged a series of championship regattas; the first was announced for Tuesday of the current week. The races will be continued once a fortnight until one in each class has won two races.

ISLE OF SHOALS REGATTA.—J. A. Poor, Esq., proprietor of the Oceanic, Isle of Shoals, N. H., has instituted a sailing regatta, open to all yachts, to take place off that point Thursday, August 20th, and sail for the Oceanic prizes, which are now on exhibition in the well-known stationery and periodical store of A. K. Loring, corner of Washington and Bromfield streets, Boston, and consist of a handsome silver punch bowl and ladle for the first class, consisting of sloops and schooners thirty-eight feet and upwards on water line; a pair of silver napkin rings of special nautical design for the second class, centre-board and keel sloops; and a silver pitcher for the third class, center-board and keel boats measuring twenty feet and less than twenty-five feet. All entries are free and may be made up to eight o'clock in the evening preceding the regatta, at "The Oceanic," or to Com. D. R. Beckford, 20 India street, Boston, until 12 M., August 19th, and all

yachts will be measured by D. J. Lawlor. The measurement will be the length on the water-line, the allowance in time to be determined in accordance with the schedule adopted by the Boston Yacht Club, by the judges, consisting of Comdr Benj. Dean, Hon. Chas. Levi Woodbury, J. Jeffries, Jr., Esq., Hon. A. H. Rice, E. E. Preble, Esq., who will give all necessary information in regard to the courses and the sailing regulations. The start will be a flying one and take place between meridian and one o'clock. Ten minutes will then be allowed for yachts of the first class to cross the line hereinafter mentioned, after which no yacht's time will be taken. Quite a number of yachts belonging to Boston, Portland and elsewhere have already signified their intention of entering, and it is hoped that some of the fast ones from New York, Brooklyn and intermediate ports will also be on hand.

—The "Wivern" of the Boston Yacht Club sailed Sunday from Boston on an eastern cruise, having on board Ex-Commodore Thomas Manning and Capt. Arthur Cheney and A. Claxton Cary. Capt. Cheney's steam yacht, *Anemone* which has lately been put in thorough order and remodeled externally, accompanying them as tender. On the evening previous Capt. Cary entertained aboard, Commodores Dean and Bangs, Capt. Nathaniel Wales, her owner, and a party of friends, who visited her to wish them "bon voyage."

—The Sloop Yacht *Narragansett*, Capt. Frank Tufts, before reported on a "down east" cruise, was last heard from at Camden, Maine.

—The Sloop Yacht *Mariquita*, Capt. Dexter, is also on a cruise eastward with a party of friends aboard.

—The yacht "Comet," belonging to W. H. Langley, Esq., of the New York and Brooklyn yacht clubs, arrived in Boston harbor Saturday afternoon, from Martha's Vineyard, *via* Provincetown, en route for Portland.

—There are now sailing in the vicinity of Newport, New Bedford, Martha's Vineyard and New Haven 136 yachts owned by gentlemen of New York, Brooklyn, and Boston. What a lovely sight!

—The "Gue Regatta Club" is a recent organization at St. Augustine, Florida. It has already a large membership and a fleet of ten yachts. Dr. J. Hume Simons is the Secretary. The first regatta of the club took place on the 10th of July between the *Fleetwing*, *Carrie*, *Gue*, and *Beauty*, in which the *Gue* was the winner. At a subsequent race the *Carrie* took the pennant. The interest in yachting and boating is growing rapidly at the south.

—On Wednesday last, (August 5th) the challenge race took place on Lake St. Clair, between the *Annie Cuthbert* of Cobourg, and the *Cora* of Detroit, for the "Goodwin Cup." There is a great deal of interest in this match because the cup is said to be the one offered by Queen Victoria to be sailed for in a race open to "all comers." The *Cora* was built at Pamrapo. Race fifteen miles and return.

—The Halifax, Nova Scotia, *Chronicle* says that George Brown will, in a few days, send to England a challenge to Joseph Sadler to row a five mile scull race, with a turn, for £500 sterling. Brown will agree to row on any water in Great Britain, excepting the Tyne and Thames rivers, with which Sadler is familiar; and will pay his own expenses, or will allow Sadler £60 for expenses if the latter will come to America.

—James Ten Eyck and Odell Dyckman both of Peekskill, N. Y., rowed a three mile sculling match on August 1st, during a rain storm. Ten Eyck dropped his oar on starting, but quickly regaining it, he soon caught up with Dyckman and passed him, which advantage he held throughout the race, coming in about a boat's length ahead. Dyckman entered a claim of foul, which was overruled by the judges. The referee was Mr. Marshall Lyons. The time, as stated, was 28m. 50s.

—The Harlem Regatta Association are likely to hold a regatta in the fall, as the prospects begin to look very favorable. This is owing to the untiring exertions of President Meeker.

—The Athletic Boating Club will send several members to the Oakland Beach Regatta near Providence, R. I. Keator, Rathbone, and McCreedy have most likely entered for the single scull race.

—The New Jersey boat clubs have organized a State Association and intend holding a regatta in the fall.

—A regatta takes place at Oakland Beach, near Providence, to-day and to-morrow, August 5th and 6th, which will be one of the great events of the rowing season of '74. Among the professionals who will wield the spruce on the occasion are the famous Ward brothers, the Biglins, Butler of Philadelphia, Scharff of Pittsburgh, Ten Eyck of Peekskill, Morris, Brown, and several others.

CANOE CRUISING.

NUMBER FOUR—PADDLING, SAILING AND PORTAGING.

THE exercise of paddling is not so graceful as that of rowing, and the strength is not exerted so advantageously; nevertheless, there is much to be said in its favor. The voyager looks in the direction in which he is travelling, and has not to strain his neck by looking over his left shoulder to see where he is going. He can observe the scenery better, guide his craft more easily in a winding river, and take advantage of back eddies by keeping close in shore when going against stream. There is a good deal of healthy excitement, too, in going down a rapid, and paddling in a rough and tumbling sea. The canoeist has a comfortable seat, and a support for his back, and is not so liable to uncomfortable abrasions from the friction of the thwart.

The process of paddling a boat along by a stroke, first on one side and then on the other, appears to me as requiring more brute force than skill; but I believe certain principles will be laid down, when paddling is more carefully examined, so as to enable the paddler to put forth his strength to the best advantage. According to my experience, the best "form" for speed is with the body bent forwards, the knees slightly bent, the paddle grasped with the hands about two feet apart (Macgregor says the width of the chest), both thumbs undermost, and the strength exerted as if the paddler wished to pole, or shove his craft forwards. The head should be kept quite steady, and the feet firmly pressed against the stretcher. With a "feathering" paddle

the wrist requires to be slightly turned, so as to put the blade of the paddle square into the water. Although I have had one of these for some years, I use it comparatively seldom, preferring the ordinary paddle, with oval blades, slightly spoon shaped. It is a good plan to have the lower ends of the blades sheathed with copper, to prevent their being split or broken when used for poling or shoving off the canoe.

The average pace of a cruising canoe in still water, without current, is about four miles an hour. The difference in speed between one of fourteen feet and one of seventeen feet long is not very great in smooth water, but in a toss the latter has a great advantage from carrying her way so much better.

Sailing.—From what I have already said, it will easily be inferred that I consider it useless to attempt to sail a small craft, of the build of a canoe, except with a fair or leading wind. Were I cruising with a "sailing" canoe in company with a man who attempted to beat his craft against a "nose ender," I should paddle to a convenient point, land, and amuse myself watching his gyrations, but would feel no desire to imitate them. A lateen sail, such as I described in the previous paper, I believe to be one of the most convenient. The pressure of the sail is evenly exerted, it is not too lofty, and requires very simple gear. The mast should be stepped about one-third of the boat's length from the stern, and should rake aft. The boom will come behind the paddler.

The canoeist steps his mast from the cockpit, makes fast the boom to it just above the deck by a spring hook, and having drawn up the hatch and seen that his sheet is clear, hoists his sail from his seat. The sheet can be arranged like the sheet of a sailing boat, *i. e.*, made fast to the gunwale on one side, passed through a thimble at the end of the boom, and then through a small pulley on the opposite gunwale, and led up to a cleat on the deck beside the cockpit. The grommet at the end of the boom, through which the sheet passes, should be sufficiently loose to allow the boom to turn easily when it is desired to reef. The process of reefing is effected in the following manner:—The sail is lowered, the boom detached from the mast, and the sail rolled round it until it is reduced to the size desired, and three or four reef points are then tied; an opening is made in the sail, where the boom is made fast to the mast, to allow of the sail being rolled round it, without interfering with this fastening, and to enable the canoeist to see better before him. Steering is easily effected with a little practice from either side with the paddle.

Portaging.—To raise a canoe on to the shoulders and carry it requires a little practice and knack. I was shown how to "portage" a canoe by a gentleman at whose house I stopped one night when on a canoe cruise down the St. Lawrence, from Quebec to the Saguenay. He had had great experience in cruising in birch bark canoes, etc., in the Hudson's Bay Company, and was much interested in my little craft. I have not seen the plan described in any work on canoes, and doubt if any one has applied it to the "civilized" canoe. Yet it is very simple, the weight of the canoe is evenly distributed, and it can be easily guided through a forest path. It is effected thus:—A strap or bar is stretched from gunwale to gunwale amidships, so that when the canoe is raised by it the stern and stern counter balance each other. The canoeist stands on the right side of the canoe, grasps the strap with his right hand, and raises the boat on to his left thigh; the left hand is then passed under it, it is turned on to the shoulders, and carried bottom upwards, "fore and aft." The strap or bar supporting the canoe rests on the nape of the neck and across the shoulders, and it is balanced and guided by the hands in front. [A photograph is being prepared of the author, with the "Passenger Bird" on his shoulders, and will be sent with the next.] An Indian will carry a birch bark canoe weighing from 80 to 150 pounds for some miles in this manner.

While writing this article, some letters on cruising canoes, from well-known canoeists, have appeared in the *English Field*, (May 23d, 30th, etc.) These bear chiefly on the subjects of sheer and camber. A certain amount of both is undoubtedly necessary in the outlines I gave in a previous paper of dimensions for a cruising canoe. I mentioned three inches sheer, and one and a quarter inches camber. This will, I believe, be found sufficient for all practical purposes in a canoe seventeen feet long. If a shorter canoe is desired for use in rough water, an increased sheer might be given to it.

The desiderata in a cruising canoe are the following:—

1st., Safety. The generality of cruisers are built with especial regard to this important point, and whether of the Rob Roy, Nautilus, or Ringleader type, are safe little vessels, and will live in a sea that would swamp an ordinary boat of twice their size. No one would wish to take a cruise in a craft like an outrigger in varied waters, as sea, lake, and river, whatever amount of speed might be got out of it.

2d., Strength. As the work for which canoes are required often exposes them to rough usage, this is a very necessary qualification. A cruising canoe ought to be strong enough to stand the strain of grounding on a rock or snag, and, on certain occasions, slept in.

3d., Handiness. This comprises portability, roominess, draught of water, etc. A good cruiser should be easily carried, either by the canoeist, or by rail or wagon, should have sufficient space for stowage of traps, as provisions, clothes, tent, etc., and should draw very little water, (about four inches.) A flat floor, with little keel, is therefore necessary, and a fair amount of beam and depth. I gave two feet four inches for the beam of a canoe seventeen feet in length. This should not be diminished for a shorter canoe, but should rather be increased to give the necessary carrying capacity—for a canoe fourteen feet long I should therefore recommend two feet six inches beam, ten and a half inches depth amidships, and fourteen or fifteen inches at stem and stern. These dimensions would give a handy little cruising canoe, like the *Nautilus*, without her draught of water. She would not be so fast, however, as the longer one.

4th. Speed and steadiness under paddle.

5th. Speed and steadiness under sail, with fair or leading winds.

6th. Simplicity of rig, arrangement of hatch, etc. This might be included under heading No. 2, and is a very important feature, which any one who has tried long cruises in these craft will appreciate. All these points must be carefully considered in designing a canoe, and undue prominence should not be given to any one of them without regard to the others.

C. M. D.

Halifax, Nova Scotia, July 17th, 1874.

Answers To Correspondents.

We shall endeavor in this department to impart and hope to receive such information as may be of service to amateur and professional sportsmen. We will cheerfully answer all reasonable questions that fall within the scope of this paper, designating localities for good hunting, fishing, and trapping, and giving advice and instructions as to outfits, implements, routes, distances, seasons, expenses, remedies, trails, species, governing rules, etc. All branches of the sportsman's craft will receive attention. Anonymous Communications not Noticed.

W. F. P., Boston.—The gun you mention will be ready second week in August, and would suit well for duck shooting.

DR. HATHAWAY.—Be kind enough to send your address to FOREST AND STREAM office. There is a Philadelphia letter for you here.

J. M. D., Bergen Point.—Will you please inform me where is the best place to buy rowing suits, and oblige? Ans. Shannon, Miller & Crane, 46 Maiden lane.

R. C., Utica, N. Y.—Which is the strongest, cleanest and best powder for a muzzle loading pocket rifle, and what quantity for a load? Ans. Try Hazard, and Laflin and Rand, 30 grains.

ROSCOE, N. Y.—How much powder and shot should the 10-bore, muzzle loader I wrote to you about stand without recoil; it is a 28-inch, Wm. Moore, maker? Ans. 4½ drachms powder and 1½ oz. shot.

FRANK.—My setter dog will retrieve a glove or stick of wood, but cannot be induced to pick up a bird. How can I overcome his aversion to feathers? Ans. We have sent you FOREST AND STREAM with the answer in full.

BLACK RED, N. Y.—Is there any sort of shooting around Newport, R. I., and what sort? Who will put me in the way of it? Ans. Newport is not a noted place for shooting. There are a few bay snipe, but upland shooting is very poor.

J. L. P., Brookline, Mass.—What is the best way to cleanse brass shells? Ans. The easiest method is to put them, one by one, in a turning lathe, take the brush of the cleaning rod, insert it in the shell, give half a dozen turns of the lathe, and they will come out clean and bright. Or, boil them in water and then wipe them dry.

G. W. J., St. Louis.—A Remington 30-inch, 44 cal., weight 10 pounds, would be just what you require. Shells made for them. Wingate's Manual would be all you wanted. "Trapper's Guide," \$1.50, is a book which would be useful. Could not have the rifle tried for you. Do not think it would be necessary. The cheapest hammocks are Mexican; good ones cost \$2.50; very fine qualities South American, \$6 to \$12.

JACKSON, N. Y.—Can you refer to a good guide in the Northern Woods, Franklin county? Ans. We personally know but few, but feel free to recommend all the Martins, Steve Turner (if not too old), Moses St. Germain, John McLaughlin, Bloomingdale Post-office, Essex county; J. Grover, Lute Evans, Martin Moody, Jesse Corey, Lower Saranac P. O., Franklin county; and Seth Wardner, Merrillville, Franklin county.

J. L. C., Augusta, Me.—Please inform me through the columns of your paper what size brass shells I shall order for a 10-gauge breech loader, and what kind are considered best; also please inform me if there is any difference in chambering a gun for metal or paper shells? Ans. 10 gauge. The Startevant is an excellent one. There ought not to be, but some makers taper too soon. Read "The Breech Loader," by Wilson.

OLD POP.—In your answer to "C. R. S., Boston," you say that the season for trout fishing closes September 15. Are you not mistaken? Ans. Yes; the law of 1873 makes the close season to include the months of October, November, December and January. We are much annoyed at our error; the answer we gave we intended to apply to Canadian salmon fishing, in reply to another correspondent. We trust none of our correspondents will be inconvenienced.

PHYSIC, Fort Edward, N. Y.—Mocking bird food is either wet or dry food, composition of both the same. Take bullock's hearts boiled, dry perfectly, and grate. Mix this in the proportion of one-eighth with five-eighths raw meal or poppy meal, and the rest of pounded biscuit. This is the dry food. For the moist food add a little lard and grated carrot. The best way, we think, is to send to Mr. Reiche (see advertisement) for the food, for we doubt if you can get the poppy meal.

J. B. H., Philadelphia.—What is the best form for fly book; one that will keep gut straight, and allow flies to be inserted and removed conveniently? Ans. There are two or three fly books of the kind you refer to, the inventions of Mr. Charles Hutchinson of Utica, Mr. Hyde of 22 Maiden Lane, and one other gentleman, whose name we forget; but we are not aware that any such are sold in the shops. The simplest has stiff card-board leaves with metal hooks for the loop of the gut, and elastic rubber eyes for the hooks. The elastic keeps the gut straight.

PEET.—Where, within a few hours of New York City, is the best place for English snipe? Ans. The salt marshes and beds of the Raritan, Hackensack and Passaic rivers. The meadows that border the Delaware and Schuylkill are good snipe grounds, but the best are on the Northern Neck of Virginia. Take stage to Leonardtown, cross to Pope's Creek. There are a few English snipe shot every year at Pine Brook and Walkill, Orange county. What game is there near Tom's River, N. J., during the month of August? Ans. Bay snipe, curlew, yellow legs, &c.

H. C., Attleboro, Mass.—I notice in last week's paper you speak of a brace of nine months' old pups that can be bought for \$50 for the brace. Can one be bought for \$25, and are they all right and pure blood (Gordons); also if these are disposed of, do you know of any pure blood pups two or three months old (Gordons or Macdonas) that can be bought for \$25 or \$30? Ans. We believe the owner is a reliable man. If you would drop him a line he would answer your questions in full. See "Idstone's" letter week before last. Macdonas pups are sold for \$100 at three months old.

G. H. J., Bridgeport, Conn.—What kind of elastic varnish or shellac is used to finish off hooks which are tied on gut, as in fly hooks, at the head, especially for salmon fishing; also, where it can be procured? Ans. Make it yourself. Thad Norris' receipt is: One ounce purest resin, one drachm gutta percha, one teaspoonful crude linseed oil, heat them, stirring with a stick so as to mix them thoroughly, and pour the compound into a bowl of cold water. When it has cooled, work it as boys do taffy. Gutta percha may be omitted, but it makes it tougher. To soften in cold weather, add a few drops of oil; to harden, add a little resin.

A. G., Chicago.—How can I reach West and Middle Florida, and what is the character of the land? Ans. From Jacksonville a railroad extends west as far as Tallahassee. From Fernandina, on the northeast coast, another road crosses the peninsula diagonally to Cedar Keys, intersecting the other road a few miles from Jacksonville. To visit Taylor and adjacent counties you might leave the northern road at the nearest station, where you would have to hire private conveyance or take the Suwannee River steamer, once a week from Cedar Keys. We cannot see, however why you should wish to visit these counties, if you are agriculturally inclined. The land is not so good as farther north and east, the distance from market great, and many other circumstances render them undesirable. The best lands for general farming, such as raising wheat, tobacco, cotton, &c., are in the northern central counties, where the surface is more rolling than upon the coast. About Gainesville there is much good pine land, but it is generally held in large plantations, and unless a man wishes to sink his capital, he had better not attack an old plantation. If oranges are to be raised, the east and southeast coast and the central portions of Florida contain the best soil and climate. Orange county is the banner county as yet. Indian River is famous for its oranges, which mature earlier and command a higher price than those of the St. Johns. Wherever you buy land, be sure it has communication more or less direct with the great cities. Land is cheap enough, and this season is a good one to buy in. If you will write more fully as to what crops you wish to raise we can advise you better.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCUCLATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company.

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,
[Post Office Box 2332.]
125 SOUTH THIRD STREET, PHILADELPHIA.
COBB'S BUILDING, DEARBORN ST., CHICAGO.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty per cent. for five copies and upwards. Any person sending us two subscriptions and Ten Dollars will receive a copy of Hallock's "Fishing Tourist," postage free.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, AUGUST 6, 1874.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Managing Editor.

WILLIAM C. HARRIS, Business Manager.

CALENDAR OF EVENTS FOR THE CURRENT WEEK.

FRIDAY, August 7th.—Buffalo Park, Buffalo, N. Y.—New York Yacht Club at Newport—Massillon Driving Park, Massillon, Ohio.—Open amateur and professional regatta at Oakland Beach, near Providence, R. I.—Princes Club Eleven with professionals, vs. Eighteen of America, at Princes Grounds, London, Eng.

SATURDAY, August 8th.—Corinthian yacht race for schooners, Newport, R. I.—New York Yacht Club at Newport—Harlem River Boat Club's practice day—Athletic vs. Boston B. B. C., at Richmond Cricket Grounds, Eng.

MONDAY, August 10th.—Atlantic Yacht Club sail for New Bedford—New York Yacht Club cruise.

TUESDAY, August 11th.—Utica Park Association, Utica, N. Y.—Rochester Driving Park Association, Rochester, N. Y.—Pigeon Shooting Tournament, Chicago, Ill.—Mystic Park, Boston, Mass.

WEDNESDAY, August 12th.—Athletic vs. Boston and Professional Nine—Utica Park Association, Utica, N. Y.—Rochester Driving Park Association, Rochester, N. Y.—Pigeon Shooting Tournament, Chicago, Ill.—Grand River and Spring Lake Rowing Association, Mich.—Mystic Park, Boston, Mass.—Match day, cricket clubs, Hoboken, foot Ninth street.

THURSDAY, August 13th.—English Eleven vs. Eighteen, at cricket, at the Oval, London, Eng.—Utica Park Association, Utica, N. Y.—Rochester Driving Park Association, Rochester, N. Y.—Pigeon Shooting Tournament, Chicago, Ill.—Queens county Yacht Club regatta—Grand River and Spring Lake Rowing Association, Mich.—Mystic Park, Boston.

OUR CHICAGO OFFICE.

IN order to establish a closer relationship with the sporting fraternity at the West, to whose earnest support the FOREST AND STREAM owes a large portion of its success, we have within the past week established a branch office at Chicago. It is in Cobb's Building, Dearborn street, where our friends will find our able representative, Mr. Ira G. True, and a corps of competent assistants. We have made this new movement because it became necessary to the proper and comfortable conduct of our growing business at the West, and not because we hope or expect to monopolize the whole of sporting journalism in that section. We feel assured that the West must at some day not distant have its own peculiar representative, but until some journal is found better able than FOREST AND STREAM to fill the position, we are convinced that we shall not be regarded as interlopers. On the contrary, we shall be welcomed as a sort of medium to promote a better acquaintance and stronger good fellowship between the East and West, enabling each to better understand the other's wants, characteristics, and good qualities. We are certain that the establishment of our office in Chicago will prove mutually advantageous.

OUR ANNIVERSARY.

THIS present number concludes the second volume of FOREST AND STREAM, and marks an important epoch in the existence of our paper, for we are now one year old. From the very outset our success has exceeded our most sanguine expectations. An army of friends in the United States, Canada, and England have rallied around us, and liberally supported us with their purses and their brains. The FOREST AND STREAM is now taken in every State, Territory, and Province. Our advertising patronage requires no heralding; it can be seen and estimated for itself. We can safely assert that few weekly papers, of much longer standing than our own, can show as large a number of advertisements, or a higher class of advertisers. And this success has accrued without any special effort on our part. Like Topsey, the paper has "grewed itself."

In the most natural way the FOREST AND STREAM has filled a void in American journalism, and in the same natural way the better classes of our people have taken it into their confidence. Hundreds who have been in the habit of looking at sporting papers as inculcating doubtful morality, have become our subscribers, and even the ladies accept the FOREST AND STREAM as a friend long needed, and worthy of the affection they bestow.

The commercial community, with keen, sagacious, critical eye, perceived the value of the FOREST AND STREAM as an advertising medium at the very start, and with scarcely any solicitation on our part, have compelled us to gradually yield them additional space, and have crowded our pages throughout the most trying business period we have had for years. Born in a panic, we have worried through it, and survive. All newspaper men know that subscribers make advertisers, and that although the presence of the former cannot be appreciated by the general reader, the last cannot exist without the first, and in fact that the one is the corollary of the other.

Six months ago, on the occasion of our entering on our second volume, we took the opportunity of thanking our many contributors for the valuable papers they had sent us. As we are about to enter on our third volume, we must repeat the same idea as was then expressed, that although the policy of a paper must emanate solely from those who direct it—if, so to speak, the canvas is to be stretched to just such limits, and only certain subjects are to be drawn upon it, it has been our contributors who have mainly painted the most glowing pictures, the finest scenes, and given those subtler touches which have made the FOREST AND STREAM so popular.

It is not wise, it is even rash, to make promises for the future. Of course there is nothing like success, but success which has not come in an accidental or haphazard way is always inspiring. Our good fortune, earned by no small amount of patient toil, we believe to be an earnest of the future. As we are certain now that our second volume was better than our first, we have every reason to hope that our third volume will still more fully satisfy the numerous readers of the FOREST AND STREAM.

MODEL FIELD LITERATURE.

NEWSPAPERS are everywhere representative of the people from whom they emanate, but nowhere do they so positively and intensely reflect the popular characteristics and material progress as in England and America. In this country the superficial intelligence that is so widely diffused, is indicated by an enormous sum total of newspaper circulation hardly appreciable even by those familiar with newspapers. This circulation seems to fill every visible channel of aesthetic or commercial requirement, and yet new channels of usefulness, constantly opening, are as constantly giving to the press increased scope and additional functions. America is young, vigorous, restless, earnest, active, far-reaching. Her newspapers are the representatives of daily progress rather than fixed fact, of development rather than ripeness, of quantity instead of quality. England, on the contrary, is one of those countries which are said to be finished, and her few representative journals therefore simply reflect the light and shade of a character fully fixed and established, and to which time adds only weight and ponderosity. Through them the minutest details of her inner life find constant expression, and it is marvellous with what accuracy they are delineated.

One cannot help indulging these thoughts when conning over the advertising columns of any of them, and of none so much as the London *Field*, the paper most nearly representative of the gentlemen of England. This journal is devoted entirely to recreation and pastime, and to the study of those natural objects which contribute to create them. It therefore depicts the æsthetic or sunnyside of life. And yet the most cynic philosopher who scans its pages cannot fail to perceive how intimately interwoven with all that is practical, or valuable, or dutiful, in existence, are these apparently trivial and superfluous objects. They enter into the very bone and essence of human life. There is scarcely a trait or a trade that is not represented here, scarcely an article of virtue or use, or any means or source of recreation, or any of the pertinings or belongings of a gentleman's establishment, or a requisite of the better classes of people, that is not included among the catalogue of objects here wanted or offered for sale. An enumeration would be tedious. And all are logically or directly connected and associated with health, wealth, independence, happiness, morality, and religion! It is evident that no mean estimate need be placed upon a truly legitimate sportsman's

paper which discourages and discards all impurities of thought and conduct, and inculcates in its readers a love for that only which is rational and elevating.

An analysis of the literary or reading contents of the *Field* alike challenges description, and compels the like wholesome and satisfying conclusions. There is not a nook or cranny of all England affording facilities for fishing, that is not represented. Its racing summary is perfect and chaste. No yacht flecks the English waters, but is accounted for here. Cricket, croquet, archery, golf, boat races, athletic exercises and general pastimes, are fully recorded. There is a veterinary department absolutely thorough in its character. No high mettled racer is born, or runs, or is sold, but that the *Field* and its readers know of it. Dogs, their kinds, their traits and characteristics are treated by the most intelligent of exponents. The shooting of the day, or the prospects for game are exhaustively discussed. What is wonderful, amid this mass of matter, is the attention paid to natural history. So absolutely correct and novel is this particular department, that special scientific journals, written for savants, quote from the *Field* on subjects ornithological and ichthyological. In the treatment of all these topics, a straightforward method, an absence of gush and bluff, a clearness and precision, gives information and instruction to innumerable readers in all parts of the world where English is spoken. Correspondents from Asia, Africa, from all habitable points of the Globe, write for it.

Mechanically, the London *Field* is a marvel. In size it is the largest known journal in the world. We have a copy of it spread out before us on the floor, which almost carpets the office. It comprises 56 pages of reading matter in small type, each page measuring 12x18 inches. Its dimensions are four feet by ten and a half, and its superficial area, reckoning both sides, is eighty-four feet. Twenty-eight and one half of its pages are devoted to advertisements, several of which are a column in length. We have taken the trouble to count them; the total for the one issue (weekly) is 1,337! If all the type used were set in a straight line, it would reach almost two miles, there being something over 1,189,440 "ems" in it. It would take a rapid compositor two hundred days to set the type by himself.

There is no publication, (excepting *Land and Water*,) in any part of the globe that exactly corresponds to the London *Field*, nor do we know that there ever will be. In America our sporting journals are dwarfed by the comparison. FOREST AND STREAM has made the *Field* its model, and emulous of a like excellence and repute, it may after a half century of arduous toil aspire to the same standard which the *Field* has reached after many years. But the way is difficult. We have upon our table beside us a dingy copy of the "Sporting Magazine or Monthly Calendar," printed in London in 1802—a really creditable effort, but scarcely equal to FOREST AND STREAM, we think. It has an illustrated title, representing a hunter going full tilt at a five-barred gate, with a fox-hound streaking it after him. Among its varied contents we note an article on "The Distinguishing Signs of Madness in Dogs," by Mr. Meynell, (Meynel?) which we have more than once had a mind to reproduce in our columns, so absolutely thorough and perfect is it, and showing how little more we know about the disease to-day than we did seventy-five years ago. One very curious article is on Bull Baiting, remarkable from the arguments used by Wilberforce and Sheridan in the House of Commons, to prohibit bull baiting and bull running. A balloon excursion occupies some twelve pages, the doughty pugilists, Belcher and Joe Ward, take up two pages, sporting intelligence a page or so, and the Poetry, or what in the peculiar stilted phraseology of the period is called "The High Court of Diana," drives along through four pages more. As an expression of the tastes of the period, it forms an interesting study, and no doubt was delectable reading for our grand sires. The long advance made in sporting literature since then is illustrated in the London *Field* of to-day. Although we are fully aware of the fondness which Englishmen have for field sports, we cannot but marvel that a country barely as large as one of our own States, (notwithstanding its civilization dates back a thousand years,) should ever produce such a remarkable weekly journal. We cannot but acknowledge the great influences for good which such papers have exerted in the United States. One thing they have certainly taught us, and that is, that a journal devoted to the peculiar topics here treated of, and trusting for the support and confidence of any community, *must be written and prepared by gentlemen, if it is expected that gentlemen will read it.*

THE PINNATED GROUSE IN ENGLAND.

WE are sorry to state that we have just received information from Sandringham that the eggs sent to the Prince of Wales by Mr. Richard Valentine have not done well, a single bird at last accounts only having been reared. We copy from the letter of the gentleman who kindly sends us the facts:—

"Upon their arrival the eggs were placed under three of the best hens to be found. After the lapse of a week it was discovered that all the eggs, with the exception of three, were added and useless, and these were hatched about twenty-eight days from date of being placed under the hen in a very weak state, but two of them more so than the other, which two have since died. The survivor would in all probability have shared the same fate had it not been discovered that it required a great deal of moisture, and since then the coop has been watered several times during the day, and it is now growing into a strong bird. When they arrived they were packed in a sort of chaff."

The keeper thought he discovered particles of manure hanging to the eggs."

We feel certain that Mr. Valentine used every precaution, and we regret exceedingly the failure of this first attempt. We trust that next year Mr. Valentine will renew the experiment. We shall be very glad to do all in our power to introduce the pinnated grouse into England. If eggs can be sent from India to England, and a certain proportion of them can be hatched, there is no reason why the eggs of the pinnated grouse cannot stand a shorter trip, and under much more favorable circumstances.

Jackson Gillbanks, Esq., informed us some time ago that a number of eggs, sent by Sergt. Bates, the American flag-marching individual, had arrived in England, but our informant expressed his doubts as to whether the eggs would hatch. We feel somewhat interested in the single bird born in England, and trust he may get along. After these birds, however, break the egg, it is still a question whether they will thrive in England. We have made up our mind to see the experiment fully tried. The fact that the chicks of the pinnated grouse require a certain amount of moisture in their baby days, is at least some little knowledge gained.

NATIONAL SPORTSMEN'S CONVENTION

The following is the call issued last June for a National Convention to meet at Niagara Falls to revise the game laws:

A CALL FOR A NATIONAL SPORTSMEN'S ASSOCIATION.

The New York State Association for the Protection of Fish and Game, believing that the time had arrived when public sentiment was in favor of forming a grand national organization for the protection of fish and game, did, in convention assembled at Oswego, N. Y., on June 23d, 1874, adopt the following:

Resolved, That this Association in convention assembled do endorse the call for a National Association, issued in the *American Sportsman* of February 21st, 1874, having for its object the procurement of intelligent and efficient legislation for the protection of game birds and fish, and did name the 9th day of September, 1874, and Niagara Falls, N. Y., as the proper time and place for holding such convention, and did appoint us as delegates to said convention; now

Therefore, We do issue this call to all State Sportsmen's Associations and local organizations, where no State Associations exist, and gentlemen sportsmen, where no local clubs exist, to take the matter in hand and send delegates to said convention and make the meeting one worthy of American gentlemen sportsmen.

A. C. MATTOON, Oswego, N. Y.
N. R. C. ROWE, West Troy, N. Y.
S. T. MURRAY, Niagara Falls, N. Y.
GEO. W. FLOWER, Watertown, N. Y.
W. J. BABCOCK, Rochester, N. Y.

We are at liberty to state that, owing to a misconception of facts at Oswego, by the officers of the Convention of June 23d, two circular letters were allowed to be issued simultaneously, one emanating from the State Association, and the other from the New York City Society for the Protection of Game. These at first sight seem to be inharmonious, and would be, (as to time of meeting, at least) were it true that two different dates for holding Conventions were specified. The impression evidently obtains that the society last named designated the 1st day of November, or issued its call for a Convention on that day, as will be seen by the following letter from a leading sportsman of New Jersey, whose status will readily be recognized by the initial signature. He says:—

MALAGA, N. J., August 2d, 1874.

EDITOR FOREST AND STREAM:—

While the sportsmen of West Jersey heartily endorse the "Call for a National Convention," and will send delegates, officially, through the West Jersey Game Protective Society to such a convention, it strikes us that the time named (some time in November) is unsuited. The convention should, in our opinion, be held either prior to November 1st, or after January 1st. Sportsmen want *all the time* they may be able to spare from their business during the open season, and should the call be issued during that time, it will no doubt prevent the attendance of many, who otherwise would give the movement their individual countenance.

Yours truly,

W. B. R.

Now the fact is, there is *but one call*. The city society has merely suggested the 1st of November as the suitable time for a Convention, for the text of its circular letter reads, as addressed to the numerous clubs throughout the country:—"You will please inform us at *what time and place you would prefer the Convention therein to be held.*" The purpose and desire was, first to obtain the sense of the country as to these points, and then conform to the expressed wish of the majority. Now, it is palpable enough that, if the majority of clubs desire the 9th of September as the day of meeting, and Niagara Falls as the place (as designated by the State Association), they will so state in their responses to the call issued by the city society, through its President, Royal Phelps, Esq. Should they so elect, nothing can interfere to impair that harmony of feeling and action which is so necessary and so much desired in this important matter. We know that our sportsmen, from one end of the land to the other, have but the main object at heart, and would deprecate anything that would even suggest discord or conflict. There is no reason why the action of the two organizations should not be strictly and wholly co-operative, the objects being identically the same. But we fear that the shortness of the time allowed to consider the tenor of either call is an insuperable objection to the immediate accomplishment of results. We admit the force of our correspondent's point which he raises, and fear that the conventions (especially the one earliest called) will be but thinly attended. If, however, it should happen that the attendance at Niagara Falls should be sufficiently large and characteristic to be considered representative, it could readily adjourn to a future time so far distant as to enable the question to be thoroughly examined and discussed meanwhile throughout the country. At the November meeting, under the other call, the delegates present could advantageously discuss their plans of co-operative game laws, which they received as a legacy from the

"American Fish Culturists' Association," and which is widely approved by gentlemen of the United States and Canada, and having done this much, would naturally adjourn to the place designated by the September meeting, and offer or solicit that co-operation which would come from the united wisdom of the two bodies. This we would respectfully suggest to the officers of the two societies or associations as the proper course to be pursued, and the only one to effect the grand object with harmony and without prejudice. We feel assured, as far as our personal knowledge goes, that both organizations are ready to endorse any movement that will secure harmony and universal co-operation of sportsmen. We trust the September meeting will be largely attended, for in a multitude of counsellors there is wisdom, and we think it more than important that, after a purely deliberative session, it should adjourn as suggested above.

THE CHICAGO PIGEON SHOOTING TOURNAMENT.—The grand shooting tournament of Chicago, Illinois, commencing on August 11th, and continuing through the week, is to be held at Dexter Park. The interesting programme of this shoot, which is appended below, is the result of the indefatigable exertions of S. H. Turrill and Abner Price, Chicago. There will be three days' single bird shooting for amateurs only, and one day for double birds, to be shot under Kennicott club rules, charge of shot one and a quarter ounce, Dixon measurement, 1,106 or 1,107. The entrance fee for single and double bird shooting will be \$10 each day; birds twenty cents each. All the shooting will be at wild birds, from H. & T. plunge traps, and the sport is to commence each day at half past nine sharp. Entries can be made at the store of F. J. Abbey & Co., 43 Clark street, Chicago, or on the grounds.

A new feature in this programme is the all-cash prize system, under which the sportsman making the best average (in the shoot proper) throughout the tournament will be presented with \$100 cash. We think the plan a good one for amateurs. Sweepstake and handicap money prizes have been in vogue in England among the most select and aristocratic clubs for years. Pigeon shooting, in order to make a sportsman a first rate field shot (it is getting rather too mechanical of late), is one of the most expensive amusements. A gentleman may win a peck of medals, but they don't pay travelling expenses. Possibly enough, they might cost the owner hundreds of dollars. A celebrated rifle shot from California once called at our office to show us his medals, etc. These different emblems of his accuracy as a marksman amounted to more than eighty, and on enquiring the expenses he had incurred to win them he replied, "Twice the value of each medal." Glory is eminently gratifying, but we think that, as in the instance of this Chicago tournament, where field sportsmen have to travel so far, and the expense of the journey is so excessive, this new system of giving *all-cash prizes* to the winners will not in any way deteriorate from the character of the amateur sportsman, as it is not a matter of chance who wins, but in nearly all cases one of skill. This tournament will afford a grand opportunity for those field sportsmen who contemplate visiting the States of Illinois, Iowa, Wisconsin, and Minnesota for a few days practice before entering on the prairie for the pinnated grouse. The following is the programme:—

FIRST DAY—TUESDAY, AUG. 11TH.		SECOND DAY—WEDNESDAY, AUG. 12	
Class Shooting, 10 Single Rises.		Class Shooting, 10 Single Rises.	
First prize, cash.....	\$175 00	First prize, cash.....	\$200 00
Second prize, cash.....	100 00	Second prize, cash.....	100 00
Third prize, cash.....	75 00	Third prize, cash.....	75 00
Fourth prize, cash.....	50 00	Fourth prize, cash.....	40 00
Fifth prize, cash.....	15 00	Fifth prize, cash.....	25 00
THIRD DAY—THURSDAY, AUG. 13TH.		FOURTH DAY—FRIDAY, AUG. 14TH.	
Class Shooting, 10 Single Rises.		Four Best Scores, 10 Double Rises.	
First prize, cash.....	\$200 00	First prize, cash.....	\$40 00
Second prize, cash.....	100 00	Second prize, cash.....	30 00
Third prize, cash.....	70 00	Third prize, cash.....	20 00
Fourth prize, cash.....	40 00	Fourth prize, cash.....	10 00
Fifth prize, cash.....	20 00	Fifth prize, cash.....	5 00

After the regular shoot is over there will be plenty of birds left for those who would like to participate in consolation sweepstakes. The total amount of cash prizes to be given will be \$2,435.

"CRUISING IN HIGH LATITUDES."—Lord Dufferin, Governor General of Canada, accompanied by a large party, has been making a tour of the Muskoka Lake region. They left Toronto on the 25th July, devoted some four days to the excursion, and then took the steamer at Collingwood for a cruise around Lake Superior. The loyal Canadians along the route did all they could to make the trip enjoyable, exhibiting their devotion to the Queen's representative by triumphal arches, pillars of flowers and evergreens, in one instance wreathing a lofty lighthouse from base to summit. Regattas, boat races, and Indian canoe races were improvised, the militia turned out, salutes were fired, flags were dipped, the Governor's party drove about, fished in the lakes, visited the Indian camps, chuckled the papooses, gave prizes, made presentations; all hands made speeches of welcome and acknowledgement, not excepting the noble red men, who took a hand in; there were dances and hops and music, and where there were no cannon to salute with, the inhabitants drilled rocks and touched off huge blasts to give tremendous emphasis to their enthusiasm. Altogether it was a rare holiday.

One of the most interesting incidents of the occasion was the visit of Lord Dufferin to the Icelandic colony established this summer on Lake Rosseau. The Governor spent some time in conversation with them, no doubt enjoying the interview greatly, unless, perchance, he had forgotten his *Latin* which he once employed to such telling advantage in the course of his visit to Iceland—all of which is reported

verbatim in his narrative entitled: "A Cruise in High Latitudes."

This Muskoka district is certainly replete with everything that can contribute to the enjoyment of sportsmen or summer tourists. As a fishing resort it has no equal, while for autumn sport it possesses advantages that few other regions have. Deer and grouse are very abundant, and we assume that any of our readers who will contrive to pass the glorious month of September there will return more than satisfied. At all events we shall follow the example set by His Excellency the Governor General, and go up there next month, though we shall not expect an equal ovation from the inhabitants.

Sporting News from Abroad.

THE ETON AND HARROW MATCH—THE WIMBLEDON RIFLE CONTESTS.

[FROM OUR SPECIAL CORRESPONDENT.]

CRICKET is no doubt a pretty amusement enough when a man careth not for a bailer or a broken shin, and can stop shooters and risk a black eye with impunity; but it is *va victis*, and a pair of spectacles (o-o), or a duck's egg is a more mortifying accomplishment than a love game at billiards, or the loss of a collar button off one's only clean shirt. I like the batting part of the business well enough, and the shandy gaff and ovations for two figures, but watching out two mortal hours under a broiling sun at long slip, picking of daisies, and missing an easy catch by way of a pleasing variety every now and then, and being cursed for it, doesn't suit the book of your special correspondent at all. The fact is, a public school routine spoils my taste that way. I didn't see the beauty of the game when it took all my pocket money, and I got in return three hours a day at "fagging out" for a prefect, and running after his swipes to square leg. But let my feelings be smothered, for cricket is the thing just now, and every one is leather hunting and talking about those inevitable stumps.

The season has reached its climax, however, and the Eton and Harrow match records the crisis in the enjoyment of devotees of the bat. "The king is dead, long live the king," they have cried exultingly during the last months, as one match decided another followed quick upon its heels, keeping their laurels ever fresh and green; but now there is nothing extraordinary on the cards except the Canterbury week in August.

The day when the two largest of our public schools contest for the honor of supremacy "on the turf," but without blacklegs, betting, or blackguardism to mar fair play and love of the sport, is a gala day which all London turns out to enjoy. As when on the occasion of the boat race they don the different shades of blue which mark their partizanship, so on this occasion do lords and ladies of high degree, cabmen, costermongers, high church curates and Presbyterians, ruffians from the New Cut and beaus from Bond street, all deck themselves in the pale rosettes of Eton, or the darker ribbons of Harrow. "Florcat Etona," the grand old school on the Thames, whose playing fields have been for many a long year the nursery of our most brilliant poets, our bravest soldiers, our most skilful engineers, our noblest statesmen, has added one more victory to the glorious scroll of fame which her sons are ever and ever regilding with brighter letters. Now and then rises the self-taught genius who, like Charles Dickens, scorns education and the muses' rod, and laughs at the aid of pedagogue and dictionary, but many are they whose footprints, still indented on the sands of time, defy oblivion, who owe the hard won palm to perseverance taught them at the school bench and the wickets. But it must not be understood from this flourish on my part that I am any advocate for classical training, and for that atrocious system of grinding young fellows in Demosthenes, Cicero, Plato, and the like, the effect of which, after about seven years' hard study, is that they are short sighted, and have not learnt one single thing of the slightest practical use to them in either law, physic, or divinity. Possibly they have acquired some amount of taste and refinement, though the latter is certainly very roughly taught by the satires of Horace and the amorous verses of Ovid, but they cannot—nine tenths of them—write a decent translation of the first *Æneid* without the aid of "a crib." But let this pass. Despite all the faults of their training, the Eton boys are turned out of the right sort of stuff, and no wonder that they are the favorites of the populace.

The scene at Lord's was much the same as usual. A broad expanse of turf, a number of white figures in the centre, with a little blue coloring about them, two black figures representing the umpire, and a band of carriages full of the living bouquets of beauty and fashion which mark the "season" in London life. There were seductive bonnets of lilac tulle, of blue faille and pink leghorn, recherché hats, coquettishly trimmed and turned up at the sides, and Duchess Marie and shepherdess costumes enough to distract even the *blasé* loungers from the parks; but turn out the footlights at the theatres, and where is the elegance of the Louis Quatorze silks and the sparkle of the diamond necklaces? In fact, the arrangements for lighting were bad in the extreme, and the clerk of the weather had turned off the sun's gas at the metre, though perhaps the dismal gloom of the day may be attributable to the comet, which has been flaring away with a six foot tail for the last fortnight. Just as the Etonians went to the wickets there was a warning peal of thunder, and down came the rain, and

in an instant the vast ring, which a moment before was dotted all round with blue and pink and all the colors of the rainbow, assumed a sober dark tint, caused by the umbrellas which were put up as quickly as soldiers shoulder arms. But in spite of all the "artillery of heaven" the match was played out.

The Eton and Winchester match of a previous week was no criterion, as the latter were miserably weak, as generally is the case from their brutal system of fagging and domineering; and their love of investing the bigger lads with despotic power and an ash stick to be used indiscriminately, resulted in their defeat by a whole innings and 150 runs. So there is a good answer to their endeavors to play at Lord's. The issue being uncertain by public form, which was good on both sides, the match was thus rendered more exciting.

The Harrowians went in first, and it was soon found that they had a giant among them in the shape of Mr. Webbe, who far excelled all his *confreres* in batting. After a long and brilliant innings he was disposed of and caught out by the Hon. E. Lyttleton, and he had placed seventy-seven to his credit. Of the rest, the only ones who made double figures were Messrs. Walker, 14; Hills, 26; and McInroy, 11. The scoring in the first part of the game was far quicker than latterly. The captain's masterly performance included seven "fours," one "three," and five "twos." Eton went in at 3.5, and left off with twelve scores to the bad, the respective scores being Harrow, 155; Eton, 143. The best light blue score was Hon. E. Lyttleton's 58, which was well put together. The next day the Harrow eleven made a total of 145, out of which Mr. Webbe claimed for his own bat no less than 80, which was a bitter pill for the Etonians, who had reckoned on the chances of a man seldom coming out twice in the same match. With 157 runs to get, and bad weather to get them in, the Etonians were not favorites, and, to use a sporting phrase, Harrow "had the call." No sooner, however, was the "transformation scene" with the umbrellas, to which I have above alluded to, over, than Eton began steadily and surely to reduce the odds against her, and the shouting in her favor grew more and more boisterous. Harrow changed bowlers six times, but could not get them to "nick" with the science they contended against, and at last the balance at the Harrowian was overdrawn, and her rival won by five wickets. Strange to say, there was not a general melee after the match, for the jealousy between the schools is great, and it often happens that more "claret" is uncorked after the match than during it. The committee had, however, this time issued a manifesto enjoining the spectators to keep the peace, and so this may be attributed the absence of any flagrant "set o." The millinery spoilt by the rain must have set the pretty dress makers in the Burlington Arcade to work with a vengeance, and the wrecked medic collars and Marguerite frills were a piteous sight.

The match between the Players and Gentlemen terminated in favor of the former by two wickets, this event not having come off since 1866. The fact is that Mr. W. G. Grace, who is, of course, the most wonderful bat of the day, plays on the side of the Gentlemen, though he is said to be really a professional, and to this circumstance may be attributed some of the Player's defeats. On this occasion his right hand had somewhat lost its cunning, as he only made 48 and 12, his scores usually being nearer 200 than 50.

This match was originated in 1830, and the professionals have won twenty-eight to the gentlemen's fifteen. This bears out the adage pretty well, that the amateur gets the worst of it when he meets a man who makes the game his living. Daft played well for his 43 in his first innings, and he is one of the best days as far as "style" goes we have in England. Mr. Grace does not play in the prettiest of form, though he is so successful, and indeed a phenomena, as no one has been seen like him since the days of Mr. Alfred Wynn. Mr. G. F. Grace is another of this wonderful cricketing family, and although he does not make the immense number of runs so easily obtained by his brother, yet he plays wonderfully steady, and with great science. In the first innings a somewhat amusing incident occurred, owing to an ill judged run, in the shape of two men at one wicket, but owing to the fumbling of Emmett they got off scot free. The respective scores were as follows. I append them as the match had some of the best players on this side of the water engaged in it:—

GENTLEMEN.		PLAYERS.

The last fortnight has been one of great interest to the sharpshooters and men fond of theories, such as velocity vs.

penetration, and the like. The Wimbledon gathering was in every way successful, and the Snider competition, between England, Ireland, and Scotland, was one of the great events on the card, and three of the English champions falling off at the 600 yards distance, it was won by the Scotch team by 13 points, the result being:—

	200 Yards.	500 Yards.	600 Yards.	Total.
Scotland.....	524	485	353	1362
England.....	514	513	322	1349
Ireland.....	465	443	340	1248

This must not, however, be confounded with the Elcho Challenge Shield, contested for by eight men selected from the best shots of the day. This came off yesterday, and the marksmen from the "land of brown heath and shaggy wood" beyond the cheviots were again the victors. The whole of the English team shot with Metfords by Gibbs, but the Irish division with Rigbys, except two, who preferred Metfords, while the Scotch divided their affections between Metfords, Rigbys, Henrys, and Ingrams. The Duke of Abercom left his post of her Majesty's representative in Ireland to take his place as captain of the Hibernian team, Mr. Dunlop, C. B., headed the Scotch, and England was under the captaincy of Mr. Wells. The firing began at noon, and the winners forged ahead at the first range and held their own, although the Englishmen shot grandly at the 1,000 yards; but the wind was very troublesome, and bad luck had something to do with the bullseyes, as everyone knows that at Wimbledon, when there is not wind enough to blow away the smoke of a cigar at the firing place, very often at the butts, when they are nearly a mile off there is pretty near half a gale. The scores were:—

Name.	800 Yds.	900 Yds.	1,000 Yds.	Total.
Scotland.....	504	488	445	1437
England.....	483	462	460	1405
Ireland.....	465	473	440	1378

For the Rajah's Cup the mother country came in first with 542, India being second with 493, whilst the Canadians were third with 450. Colonel Gilmour, the captain of the Canadians, duly offered his congratulations to the English team.

The Ashburton Shield, which is "a challenge prize" competed for annually by the cadet volunteer corps of the various public schools, was won this year by Marlborough, Rugby, the great football school, being second, and Winchester, Eton, and Harrow, the *élite* and largest of the lot, being actually at the bottom of the list. Nine schools were represented, and the Spencer Cup was won by a Cheltenham boy, who scored twenty-eight in seven shots at 500 yards.

A great deal of fun was got out of a flat race among the men, the horses being wicker, with a couple of volunteers for legs, and a real live jockey, and there were many athletic sports which provided the visitors to the heath with an endless fund of amusement.

The Bedford agricultural show has been a rival attraction, and has converted a quiet pastoral town which, in times of peace, has only two cabs and one omnibus, into a sort of Paris gone mad. There are bloated pigs and obese oxen, gigantic mangels and dropsical turnips, and a fine exhibition of dogs, roots, agricultural implements, chaff cutters, ploughs and threshing machines "et hoc genus omne," but the stallions and bulls, brood mares and milch cows, rendered the show, in numbers and quality, something very superior to anything ever previously witnessed. The entries of horses were 420, and included some of the best blood in the country. There were two £50 cups for the best farms as regards working order, and Lord Charles Russell, who gave one of them, seems to have hit on the very best plan for reconciling his tenants to hares and rabbits. The horse show at the Alexandra palace brought forth a similar collection of horse flesh, but I refrain from touching on it, as my space is limited, and so is the post. The sale of the remainder of Sir Joseph Hawley's horses at Tattersall's did not realize a large amount of money, "Alava," who is in training, only fetching 350 guineas. A colt by General Peel, the property of Mr. Walker, went for £61, though he had been purchased when a yearling at close up to £2,000, and had never run. Such is the uncertainty of the turf, and of buying thoroughbred stock.

Lord Rosslyn's black and tan setters, sold at Aldridge's by auction, fetched some very fair prices, considering they were many of them unbroken. One fine dog, Revel, sold for £47, and a bitch called Ruth brought £31. Lord Cawdor's drafts fetched prices varying from £9 to £25, most of them being puppies of 1873, and Lord Sefton's pointers brought in the total amount realized at the sale to £885.

The American base ball players are expected here on the 26th, and I will take care to go and see their exhibitions and matches, which all look forward to with great interest.

LDSTONE, JR.

London, July 16th, 1874.

—San Francisco is inaugurating a regular system of rifle practice. The Sumner Light Guard, Capt. H. J. Burns of Company E, First Regiment, having purchased Remington target rifles, had a good day's practice on the 20th of last month at the range at Alameda. We append some of the best scores:

AT 500 YARDS.		AT 1,000 YARDS.	
Captain H. J. Burns.....	3 3 3 2 4	15	
Charles Nash.....	2 2 2 3 0	9	
Captain Burns.....	3 4 4 3 4	18	
Charles Nash.....	2 4 2 3 3	13	
G. E. Foster.....	3 3 3 3 3	15	
William Murray.....	3 2 4 2 2	13	

Eighteen points in a possible twenty is tall shooting. Next year when we will have a State match, we trust to see some of these promising California marksmen at Creedmoor,

Shot Gun and Rifle.

GAME IN SEASON FOR AUGUST.

Woodcock, *philohela minor*. Squirrels.
Pinnated grouse, *cupidoria cupido*, Snipe and Bay Birds.

Pinnated grouse, or "prairie chickens," are in season in Kansas, Nebraska, and Minnesota, August 1st; in Michigan, August 5th; in Missouri, Illinois, Indiana and Ohio, August 15th; Wisconsin, August 20th; Iowa, August 22d; in Maine, New Hampshire, Massachusetts, New York, New Jersey and Pennsylvania, September 1st, and in Connecticut and Kentucky, October 1st.

Details of pigeon shooting and scores of rifle matches, and other interesting matter, should be mailed so as to reach this office on Tuesday morning in each week.

—The "gunning" season approaches, and we shall soon run up our fall bulletin of "Game in Season." Sportsmen who wish to supply deficiencies in their equipments, or to obtain entirely new outfits, will do well to scrutinize our advertising columns. There is not a journal in America that offers such variety, abundance, and quality of sporting material as the FOREST AND STREAM, and there is not, by the written testimony of the advertisers themselves, such a satisfactory and directly remunerative medium. The reason is obvious. Our few thousand readers are all purchasers of sporting material of some sort, who scan these advertisements with even more interest than they do the body of the paper, while the many thousands who take the widely circulated dailies merely glance at them for latest news, or search the advertising columns for specialties only, and they include no larger number of sportsmen. Merely as a directory, our columns are most serviceable, while as a guide to the novice they become invaluable, because our customers are responsible houses only, they are reliable, and long known to the trade. The manager of this paper will not knowingly recommend any article which is not of utility, or which is not as represented. We have not hesitated to reject advertisements repeatedly which we felt would mislead or disappoint those who would rely upon their recommendation through confidence in us.

—Woodcock in market very scarce, and worth as much as \$2.00 a pair. Occasionally a batch of one hundred cocks comes from the west, and some scattering few from Connecticut. Perhaps the eastern bird is better than those from the west. Bay birds increasing in quantity, and in prime order. Bunches of black birds from the Delaware are putting in an appearance; they are the forerunners of the luscious reed birds.

—A correspondent in Salem, Mass, under date of August 1st, sends the following full and very interesting information. "By comparison of the several localities mentioned at any given date, a very correct idea can be formed of the time when birds begin to arrive, or are in season.—Ed:]

Woodcock are scarce, some of our best shots having got but three or four a day, and this not often. Quail are going to be quite numerous. Partridges about as usual. Shore birds are beginning to arrive at Rowley and Ipswich; some of the local gunners get some good bunches, (or bags, but they usually bunch them,) of birds, two of them on the 14th of last month getting twenty-eight out of thirty "robin snipe" in one flock; but such chances are not common. We usually, if at all, making bags either from single or scattering birds to small bunches of not more than twelve or fifteen. "Summer yellow legs" are along, as are a few "winters;" peeps and "ring-necks" are in prime order for a pie. Upland plover have just got along. I saw the first two yesterday, and they were very shy; the prospects are for a few days fair shooting if you can "hit the day;" but our shooting has been growing poorer for years, there usually being more gunners than birds. I got a few birds yesterday, weather hot and birds scarce. But "patient waiters are no losers," you know, and you may yet hear from me in a locality some ways from the present abode of

Yours, very truly,

R. L. N.

—Fred. Pond writes from Montello, Wisconsin, July 30th:

EDITOR FOREST AND STREAM:—

Game of all kinds is plentiful in this vicinity, and especially wood-ducks and blue-wing teal, which promise to afford splendid sport the ensuing season. Woodcocks are exceedingly scarce, and the season has been a poor one in most parts of the State. Judging from appearances the Mallard duck will be plentiful, as well as all water fowls. A prime sporting ground for ducks is at Puckaway Lake, five miles east of Montello. The Puckaway Club has its headquarters on the margin of this lake, and eastern sportsmen will have a cordial welcome at the rendezvous of this hospitable club. It contains the prominent business men of northern Wisconsin, and already has obtained an enviable reputation among lovers of gun and rod. In the region bordering on Lake Superior ruffed grouse abound, and on the opening of the season a grand time is anticipated by the sportsmen of that vicinity. Black bass and pickerel are abundant at Buffalo Lake, west of Montello, and those fond of piscatorial sports have enjoyed the fishing immensely.

—The latest news from Minnesota is contained in the following:—

MINNEAPOLIS, July 31st.

Game is not abundant now, but there is a good prospect for fall shooting. Chickens are said to be plentiful all around. Partridges (quail) are very common, and one may easily start up a covey of ten or fifteen any day now. The young are about two-thirds grown. All the woodcock are obtained along the bottom of the Minnesota River. Some very good bags have been made. The large bags at first were caused by the high water in the river driving them together in certain localities. Pigeons have been very scarce here this year. Only very few have been shot. Plover, Bartram's, have been shot this week. They have commenced flocking preparatory to migrating. Two guns got twenty-one on Tuesday. They go in pairs and in flocks of from five to ten, and are very shy. Ducks, few—those that have been breeding here. There is more game up towards Brainerd and in the southwestern part of the State.

FRANKLIN BENNER.

—We have a letter from "Herbert," of Hannibal, Missouri, stating that his invitation to shoot game in Kansas, to which we alluded last week, is open until the 10th September. The latest news from the prairies informs us that the birds are in abundance, but not yet sufficiently strong of wing to gratify a conscientious sportsman.

—As many of our readers are contemplating excursions after pinnated grouse the coming season, the following concise information from an attentive correspondent, O. H. Hampton of Redfield, Iowa, will be accepted with thanks. A cursory review of our journal will also designate many other good localities that are not mentioned here:

Crossing the Mississippi at Dubuque, take Illinois Central road to almost any station west of Iowa Falls, as almost every foot of that region abounds in fine shooting. Crossing the river at Rock Island or Keokuk, come to Des Moines and take Des Moines Valley Railroad to Grand Junction; anywhere between there and Fort Dodge is good. Or, take Chicago, Rock Island and Pacific road, and stop almost anywhere after getting fifty miles west of Des Moines. In fact, one can hardly go amiss after getting into the western half of the State.

As a rule, it is best to stop at a country house some miles out from the railroad and on the line of some stage route, so as to have communication with some railroad town. The best place I know of at present is between Casey (on the Chicago, Rock Island and Pacific R. R.) and Fontenelle; distance, twenty-five miles, and just twelve houses on the road, and a daily hack line to the railroad. Storm Lake, on the Iowa division of the Illinois Central Railroad, is a famous resort for both fin and feather, but I presume it is too well known to be the best place now. Spirit Lake, in the extreme north of the State, is said to contain myriads of hungry fish, and the chickens fairly swarm around it. There will also be fair duck shooting there as early as September. There is much difference of opinion here as to the number of young birds this year. We had some fearful thunder storms here in June, which some think made sad havoc with them, though I hope they are mistaken.

One of my German friends says that "not a goot many skiekens vas hatched to dat times, but so much tunner und blitzen had kilt der eggs till dey doosn't hatch any more." We have frequently heard it stated that thunder will destroy the embryo bird. Do any of your readers know whether it is true or not? Our Legislature, in trying to amend the law last winter, worded it so that it gives no protection to "chickens" at any time unless they are offered for sale; consequently they are now being killed every day. A few days since, the writer and a friend rode out on the prairie to give the dogs a run and see if we could find some big enough for breakfast. My friend did not take his gun, as we thought one would do what shooting we wanted done. Having filled his pockets with shells, he took the gun and rode along, while the dogs ranged round over the prairie. Pretty soon we saw that "Sport" had them at least a half mile away on the slope of a hill. Putting the horses on the run we were soon there. My friend jumped out of the buggy, and in less than half a minute had raised six nice ones, over half grown, and knocked two of them over. Standing the gun on the ground, he began feeling for his powder flask, and not finding it called to me to fetch the ammunition, and a moment after he asked in a very excited manner: "What in thunder have you done with the ramrod?" "Feel in your left coat pocket," said I. He took the hint at once, and was soon loaded, muttering something to himself, of which I could only understand the word "blockhead." Well, we got four out of that covey, four out of another, and two from another; also two old roosters. We might have got a good many the size of quails, and although very nice eating, we thought it a shame to kill them when we knew they would be twice as large in two weeks. Those we killed were full as large as a pheasant (partridge). The thermometer stood at 104 in the shade that afternoon, with a clear sky and not a breath of air stirring. One of our dogs (a dropper seven years old) hunted finely, not seeming to mind the heat at all, while an imported English pointer "wilted" in less than an hour. It is a very poor time to find them just now, as they are scattered over the prairie and in the uncut wheat. If any of your readers want further information, and will address me by letter, they will be welcome to any knowledge I possess.

O. H. HAMPTON.

Redfield, Dallas County, Iowa, July 23d.

—The influential sportsmen of Wisconsin have on foot a project to call a State Sportsmen's Convention about the last of August next.

THE OTTAWA DISTRICT.

EDITOR FOREST AND STREAM:—

One of the best hunting grounds, easily accessible from the cities of Montreal and Ottawa, is to be found in the country watered by the river Nation and its tributaries. This river, which empties into the Ottawa about forty miles below the city of the same name, is long, narrow and deep, flows through a somewhat flat country, and is one of the most important lumbering tributaries of the Ottawa. It has numerous small streams running into it, which make the surrounding country penetrable by boat. The whole region abounds in mineral springs, to many of which the deer resort in numbers on account of the saline character of the waters.

To reach the hunting ground you leave Montreal by the 7 A. M. train for Lachine; thence steamer Prince of Wales (breakfast) to Carillon; thence railroad to Grenville, as the steamer does not go through the canal. From Grenville the steamer Queen Victoria (dinner) to Brown's Wharf, where, if there are more than two or three in the party, a conveyance must be hired to transport you to Plantagenet. There is a mail wagon which can carry two or three persons, but no more. At Plantagenet you must stop all night, and there a conveyance may be obtained to take you to what is called "The Brook," where, if you are fortunate enough to secure the services of Jim Simpson, you may expect sport. There are other hunters besides Simpson, but I have always hunted with him, and can speak of his qualities from personal experience. If there is a large party I would advise their taking a little tea, sugar, flour, &c., with them, otherwise they may be the cause of a fifteen mile journey. The fare from Montreal to Brown's Wharf is about \$3.25, including breakfast and dinner; from the Wharf to Plantagenet, fifty cents. A buggy and driver to The Brook will cost about \$2, and you will require to pay Simpson \$2 per day for himself and dogs for each day you hunt; perhaps a little more, should there be a large party. The fare from Ottawa to Brown's Wharf is about \$1.25. Early in the season it is preferable to camp out, but Simpson can generally find accommodation for a few if he has not got it himself.

Besides deer, this region abounds with bears, foxes and hares, and the ruffed grouse are so tame that they may be shot with a pistol, and if they are not hit at the first fire they will not fly, but sit and stare at you while you blaze away within a few feet of them. The only way you can hunt them is to have a dog that will tree them and bark until you come up. In this way large numbers may be obtained. Yours truly, MANTLET.

CUFFEE AND THE GAME BIRDS.

ATHENS, Ga., July 29th, 1874.

EDITOR FOREST AND STREAM:—

Among all the readers of your paper there are none more enthusiastic in its praise than certain of those who throw the line and follow the game, way down here in Dixie. The paper is so free from the slangy, horsey, cute style of most sporting journals that a gentleman reads it feeling that he is imbibing deep draughts from the classic fountain of true sportsmanship, with no qualifying ingredients to suit the palate of the vulgar and pretensions. We of the South have always been devoted to the field sports of hunting and fishing; other "rational pastimes," to quote one of your phrases, have been neglected. During the late war, when most of the sportsmen with the characteristic ardor of the guild, were in the army, game multiplied with astonishing rapidity. Deer re-appeared in thickly settled localities, wild turkeys became abundant, and our Southern partridge, *ortyx virginianus*, covered the face of the earth. Since then the free negro has destroyed a vast quantity of game in season and out of season. Cuffee is a mighty hunter. With a three-dollar shot gun, or an old army musket—a very popular piece with him—a box of G. D. caps, a powder "gourd" and a shot "gourd," and a miserable cur that will snap at the heels of a white man, his appointments are complete. He can gobble the turkey, wild and domesticated. Can he find a covey of partridges his murdering tube will sweep the entire brood at one discharge. So far from giving them the chance of flight, his only regret is that they are not tied to the ground. Sometimes in his excursions he meets an ambulatory hog. Cuffee, like Mr. Winkle, "makes cold meat of him," and fills his game bag and has something to spare, at one shot."

The last Legislature passed a game law, imperfect in many features, but still a great terror to this sable pot hunter, who, after all, is no more than a species of the same animal described in a late number of FOREST AND STREAM. We have in season fine sport shooting the partridge—Bob White. I think no birds can afford more genuine fun than this game little fellow. We have some fine dogs, setters and pointers, and are trying to improve the strains by importations of purer blood. A late performance of a young lemon and white setter of a friend of the writer may be not uninteresting: My friend and another gentleman were riding in a light wagon to the ground over which they intended to shoot, and the pup was apparently sleeping in the foot of the wagon. Driving through a lane the pup suddenly sprang up and evinced much excitement. The horses were stopped, when he came to a dead point, standing in the foot of the wagon, pointing one side of the road. He was taken up and dropped out of the wagon on the ground, when he immediately resumed his point and stood until the birds, a fine covey, were flushed in the field near the fence. This is very well for a puppy of nine months.

We had last fall a gentleman from New York with us who shot some in our country. He was a gentleman in the true sense of the word, but was not very familiar with the use of fire arms. His appointments were *au fait*. His shooting jacket was a perfect *chef d'œuvre* in its line; his leggings were impenetrable even to Georgia briars; his gun, a fine breech-loader, and his dog a good-looking liver and white setter. It was a source of deep regret to us—a sentiment in which the dog joined—that while firing at a squirrel running on a fence he shot his dog, by this casualty marring his sport.

We are rapidly discarding muzzle loaders. I am anxious to see the Remington. We have heard a great deal of the gun, and its price certainly is reasonable. I know of three gentlemen who intend to order Remington breech-loaders, if they can see the gun fairly tested. I have ordered one, and if it is a good one when it comes I will write you an account of it.

With much esteem, yours, &c.,

GEORGIAN.

THE CINCINNATI PIGEON TOURNAMENT.

CINCINNATI, July 25th, 1874.

EDITOR FOREST AND STREAM:—

The first Grand Pigeon Tournament given under the auspices of the Cincinnati Shooting and Fishing Club came off this week at Carthage. The shooting was open to amateurs only, professionals barred. All the matches were shot at ten single birds, 21 yards rise, 80 yards boundary. Shooting governed by the club's rules. To save time and space I will give only the scores of the first ten shots of each man and the results of the ties.

FIRST DAY.

Tuesday, July 21st, 1874.

Name.	Killed.	Ms'd.	Name.	Killed.	Ms'd.
Hascall.....	10	0	Camp.....	8	2
Stager.....	10	0	G. Redmond.....	7	3
Langdon.....	10	0	Warren.....	7	3
Jones.....	10	0	Dodsworth.....	4	6
Sherman.....	9	1	Wright.....	6	4
Thornton.....	9	1	B. Redmond.....	8	2
McAvoy.....	8	2	Needy.....	8	2
Proctor.....	9	1	Hinsdale.....	5	5
Turrell.....	9	1	Garrison.....	8	2
Ellard.....	8	2	Woods.....	5	5
Choate.....	6	4	Hummell.....	7	3
Kennedy.....	8	2	Ziegler.....	5	5
Logge.....	7	3	Fisher.....	8	2

The ties were then shot off. After the match had closed the following was the summary:

- 1st Prize—\$100. Won by Mr. Hascall.
2d Prize—\$75. Won by Mr. Thornton.
3d Prize—\$40. Won by Mr. Kennedy.
4th Prize—\$25. Won by Mr. Mannen.
5th Prize—\$15. Won by Mr. Wright.
6th Prize—\$10. Won by Mr. Woods.

The rest of the day (as was every other day) was taken up by sweepstakes, which were not of enough importance to record.

SECOND DAY.

Wednesday, July 22d, 1874.

Name.	Killed.	Ms'd.	Name.	Killed.	Ms'd.
Eckert.....	8	2	Wood.....	9	1
Hascall.....	10	0	Graybell.....	9	1
Henschberg.....	7	3	Raymond.....	7	3
Long.....	9	1	Bimbaum.....	8	2
Jones.....	9	1	Hall.....	6	2
McAvoy.....	8	2	Lockett.....	8	2
Sherman.....	10	0	Dubois.....	10	0
Blair.....	9	1	Horn.....	9	1
Gilman.....	10	0	J. Koehler.....	7	3
Langdon.....	10	0	Dodsworth.....	10	0
Werk.....	7	3	Hinsdale.....	8	2
Turrell.....	10	0	Stager.....	9	1
T. South.....	10	0	Bogge.....	8	2
Church.....	7	3	Thornton.....	10	0
L. South.....	8	2	H. Koehler.....	6	4
Phelps.....	6	4	Hughes.....	8	2
Choate.....	8	2			

The ties were then shot off, making this summary:

SPECIAL PRIZES PRESENTED BY FRIENDS OF THE CLUB.

- E. H. Gilman of Detroit, Mich., first prize—Fine Double Breech Loader—\$100.
T. J. South of Frankfort, Ky., second prize—Breech-loading Rifle, 44 calibre—\$65.
H. W. Sherman of Beloit, Wis., third prize—Silver Ice Bowl—\$35.
L. Dubois, Detroit, fourth prize—Pair Vases—\$25.
C. Dodsworth, Cincinnati, Ohio, fifth prize—Silver Tobacco Box—\$30.
M. Langdon, Cincinnati, sixth prize—Silver Butter Dish—\$18.
S. H. Turrell, Chicago, seventh prize—Ice Pitcher—\$12.

L. H. Hascall, Grand Rapids, Mich., eighth prize—Pair Goblets—\$10.
T. Thornton, Newport, Ky., ninth prize—Silver Castor—\$10.
John E. Long, Detroit, tenth prize—Cup—\$5.

THIRD DAY.

Name.	Killed.	Ms'd.	Name.	Killed.	Ms'd.
Hascall.....	9	1	Wentz.....	9	1
Werk.....	8	2	Langdon.....	7	3
Sherman.....	9	1	Choate.....	8	2
Church.....	10	0	Dubois.....	7	3
Proctor.....	8	2	Allen.....	6	4
W. Hall.....	9	1	Kilgour.....	8	2
Nettlefield.....	8	2	Wright.....	8	2
Stewart.....	7	3	Bates.....	7	3
Gilman.....	10	0	Eckert.....	9	1
Long.....	8	2	Baldwin.....	7	3
Jones.....	10	0	Caldwell.....	10	0
Lockett.....	10	0	McLaughlin.....	7	3
Boli.....	4	6	Grandin.....	8	2
Thornton.....	3	1	Anderson.....	5	5
T. South.....	7	3	Mannen.....	10	0

After shooting off ties it was found that Mr. Jones won first prize—a Cup valued at \$125. Mr. Caldwell won second prize—\$80. Mr. Horn took third money—\$50. Mr. Gilman took fourth money—\$20. Hascall, Sherman and Hall divided the remaining money, \$50.

FOURTH DAY.

Name.	Killed.	Ms'd.	Name.	Killed.	Ms'd.
Bates.....	6	4	Williamson.....	3	7
Hall.....	4	6	Choate.....	2	7
Blair.....	5	5	Corry.....	4	6
Bimbaum.....	5	5	Ziegler.....	6	4
Jenkins.....	1	9	McLaughlin.....	5	5
Ellard.....	4	6	McMakin.....	3	7
Farran.....	5	5	Watson.....	3	7
Stager.....	4	6			

The ties were then shot off. Ziegler took the first prize—a Cake Basket worth \$25. McLaughlin took second prize—a Gold Locket worth \$20. Corry took the third prize—a Plow worth \$18. Watson took the fourth prize—a Vase worth \$10.

This closed the tournament. It was an entire success.

W. L.

TORONTO, July 28th, 1874.

EDITOR FOREST AND STREAM:—

The following is the tie which was shot off last Saturday (July 25th). The contestants had to retire five yards instead of three, as in last issue.

Yards.	Name.	Score.	Total.
29 yards.....	J. Taylor.....	1 0 1 1 0	3
28 yards.....	W. Ward.....	1 1 1 0 0	3
27 yards.....	W. Bugg.....	0 1 1 1 1	4
26 yards.....	J. Ross.....	0 1 0 1 0	2

Yours truly,

R. S. W.

SYRACUSE, N. Y., July 31st, 1874.

EDITOR FOREST AND STREAM:—

Inclosed please find an account of the Gold Medal Shoot which took place at Centreville, where our club holds its shoots, between Mr. James Manning and William Fage. Yours respectfully,

W. E. F.

The gold medal of the Central City Sportsmen's Club was contested again yesterday by Messrs Manning and Fage, at Judd Settle's, at Centreville. The result was as follows:

Manning.....1 1 1 1 0 0 1 1 1 1 0 1 0 1 0 1 0 1 1—15
Fage.....1 1 1 0 1 1 1 0 0 1 1 1 1 1 0 1 1 1—17

Mr. Fage took the gold medal, but was immediately challenged by R. B. Strong; the contest will come off within a month. A match was then shot between Messrs. Garrison and Lobb, Mr. G. giving Mr. L. three dead birds. Mr. G. killed all seven, and Mr. L. only two.

—Captain Bogardus requests us to state that he will take \$500 to \$100 that he will kill one hundred straight birds, from spring traps, twenty-one yards rise, three minutes to be allowed to gather a bird. If the match is accepted within four weeks from date the shoot to place in the vicinity of New York.

—The Buckeye shooting club of Cleveland, Ohio, commenced their pigeon shooting tournament at Rocky River on August 4th, and continues until to-morrow. A large number of field sportsmen and expert shots are on the ground. The amount of cash prizes is \$1,000. We trust to print the details next week.

—By an act of the last Legislature of the State of Connecticut, the shooting or capturing of the woodcock is strictly forbidden during the months of August and September, and of quail between the last day of July and the 15th of October. It would be well if all eastern papers would give notice of this law, so that the game may be duly and properly protected and preserved until in a proper condition to be enjoyed.

NEW HAVEN, Conn., July 29th, 1874.

EDITOR FOREST AND STREAM:—

I take pleasure in giving you the "outline" of bill I presented to our last Legislature, and which, by great effort on my part, was passed. It takes effect so soon that a notice of it in your much admired paper will serve, to a great extent, to prevent the violation of the same.

It is to the effect that woodcock may be shot during July, October, November and December in each year. That partridge may be shot during October, November and December, and that quail may be shot from October 13th to January 1st. Snaring and trapping of the above game is strictly forbidden, except on one's own land, and that can of course be done only in season. Selling or dealing in the same is also forbidden. The fines are heavy, and in case they are not paid imprisonment of sixty days is specified. Anyone can complain anywhere, and if he prosecutes his suit to effect, the fines go to the complainant. The destroying of nests or eggs is also forbidden. I think the feeling is very strong for carrying out the law. I certainly shall do all I can to bring about a different state of things from that which has heretofore been the practice in this State as well as others. I have suggested the organizing of a fund sufficient to afford and employ detectives in the different parts of the State. I think a few arrests as examples would do a great work for the enterprise.

I submitted one section in the act, which was \$50 fine for anyone to be in the field or woods on land of another with bird dog and gun during June, August and September, but our people have not got educated quite up to that, so it was amended by striking this section out.

By giving this outline a place in your paper in your own language you will do many a favor. Yours truly,

S. CHAMBERLIN.

SHREWSBURY, July 25th, 1874.

EDITOR FOREST AND STREAM:—

There are many sportsmen's clubs formed on the basis of protecting game, but is not trap shooting the principal inducement to the members to hold their meetings, often to the neglect of the much talked-of protection of game? And at these meetings are not the members surrounded by the very class that it is their duty, and should be their pleasure, to prosecute for violating the game laws?

The formation of clubs for the protection of game should be a responsible matter, and carry weight with it, receiving the individual attention of sportsmen, which I must doubt if it can, where trap shooting forms the principal feature, let that association be county, state, or national.

CHECK COR.

CREEDMOOR.—Every day last week found various regiments improving themselves in rifle practice at the range. On Tuesday, July 28th, the third competition for the "Kellogg" badge took place; open to Company A, Twenty-third Regiment; distances, 200 and 500 yards. The badge was won by Sergeant Allen. The following are the best scores:

Name.	200 Yards.	Total.	500 Yards.	Total.	Grand Total.
Sergeant A. Allen, Jr.	22 22 23	11	30 30 34	10	21
Lieutenant Story	23 22 22	11	20 20 24	8	19
Private J. M. Allen	22 20 03	7	43 00 02	9	16
Private C. A. Coffin	00 03 22	7	20 00 32	7	14
Private C. W. Dibble	23 03 32	10	00 00 02	2	12

Practice by the teams of the Twelfth, Twenty-second and Seventy-ninth Regiments followed. The following are the scores of the best twelve made by the Twelfth. Five shots at 200 and 500 yards:

Name.	200 Yards.	Total.	500 Yards.	Total.	Grand Total.
Private W. S. Smith, Co. D.	43 22 23	14	44 34 44	19	33
Private P. Doerle, Co. E.	23 33 33	13	43 33 43	17	31
Private A. Wood, Co. D.	33 33 34	16	34 23 33	15	31
Captain H. B. Smith, Co. D.	22 33 33	13	43 42 44	17	30
Captain Banta, veteran	32 22 22	11	33 44 43	17	28
Private W. G. Carson, Co. D.	34 22 22	13	33 22 44	14	27
Captain Brady, Co. C.	34 22 23	14	43 20 44	13	27
Lieutenant T. D. Rich, Co. C.	23 22 22	11	34 23 32	15	26
Private C. B. Waterbury, Co. F.	23 34 43	15	02 33 33	11	26
Adjutant W. H. Murphy	23 22 22	11	32 23 44	14	25
Sergeant J. Wood, Co. D.	32 22 22	11	23 22 33	12	23
Sergeant W. C. Reddy, Co. D.	20 03 33	8	43 22 23	14	22

The Twenty-second team made ten shots at each range. The total was below the usual average, which may be accounted for by some defect in the State ammunition.

Name.	200 Yards.	500 Yards.	Total.
Sergeant Freeman, Co. E.	25	30	55
Sergeant Magnee, Co. F.	20	31	51
Lieutenant Waydell, Co. A.	20	31	51
Captain Horsfall, Co. I.	21	23	44
Sergeant Briggs, Co. C.	22	20	41
Private Roux, Co. B.	23	18	41
Private Backer, Co. F.	23	17	40
Private Moller, Co. A.	21	19	40
Corporal Lockwood, Co. D.	18	19	37
Private Borman, Co. E.	20	12	32

The team of the Seventy-ninth fired seven shots at each range. Mr. W. S. Smith of Company D, made 19 in a possible 20 at 500 yards.

On Wednesday, July 29th, the match for the selection of the distinguished few who are to be pitted against the Irish team took place. The shooting was interrupted at times by the rain, so that all the marksmen present could not have their turns at all the ranges. We append the scores made at 800 and 900 yards, the 1,000 yards range not having been used. Fifteen shots each at 800 and 900 yards:

Name.	800 Yards.	900 Yards.	Total.
J. S. Conlin	50	51	101
L. L. Hepburn	49	44	93
G. W. Yale	54	37	91
H. E. Fulton	43	46	89
L. Backer	50	37	87
A. V. Davis	42	43	85
J. P. M. Richards	47	34	81
P. S. Gardner	49	30	79
Lieut. Colonel Gildersleeve	36	41	77
J. Trageser	33	34	72

Mr. Conlin's score of 51 at 900 yards, a centre and almost a half at every shot, is very good shooting.

On Friday, the 31st July, the second match for the gold badge presented by Capt. L. C. Bruce to the Seventy-ninth Regiment Rifle Club took place, and was won by Private Melville with a score of 41.

HAMILTON, Ont., August 3d, 1874.

EDITOR FOREST AND STREAM:—

I send you an account of the Small Bore Rifle Match for the championship of Canada, which came off at Toronto, between a team of six of the Toronto Rifle Club and six of the Victoria Rifle Club of Hamilton. This match has been in abeyance since last year, as nearly all of our shooting men were absent, on receiving the challenge; some in England, and others in different parts of Canada on their holidays, so the match had to be postponed until this season; and for the same reason several of our best men being at Wimbledon, we were rather weak. But to do justice to the Toronto Club, we feel it obligatory on our part to give them an opportunity of becoming champions, so the match was arranged to take place on the 29th of July.

The day was one of the worst for shooting that I have experienced. At the 800 yards we had sometimes nine feet of wind from the right rear, and all of a sudden it would calm down to three feet, and being from the rear we had to watch our elevation, as well as our windage, which made it very difficult to guess, and consequently most of our scores are very low. As you will see, the match resulted in a victory for the Victoria Club by 23 points. When through at the 800 and 900 yards the Torontos were ahead 13 points, and to all appearances had the match in their own hands, but on going back to the 1,000 yards the wind being stronger and more tantalizing than ever, seemed to harass the Toronto men, and after the second round the Victoria men made up the 13 points which they were behind, and continued to increase their score until the end of the match. The Victoria Club have been champions since 1867. Some of us are going to the Montreal Tournament, where we hope to meet a good representation from the N. R. A. and the Amateur Club. We owe them and Colonel Gildersleeve our thanks for their courtesy in granting us the use of their ranges to shoot a match with the Irish team, and I hope it may be arranged that the three teams shall shoot at the same time, as it will make the match so much more interesting.

The following are the scores:—

TORONTO RIFLE CLUB.					
Ten Shots at Each Range.					
Name.	Rifle.	800 Yds.	900 Yds.	1000 Yds.	Total
A. Bell	Rigby	36	34	29	99
W. Cunit	Metford	33	34	22	89
W. Stanley	Metford	29	28	25	82
C. Shepherd	Rigby	29	28	22	79
George Margetts	Metford	32	27	18	77
R. Anderson	Metford	29	30	8	67
Total					493

SHOOTER.

The following letter, emanating from the Province of Quebec Rifle Association, will interest our readers.—

MONTREAL, July, 1874.

DEAR SIR:—

I beg to acknowledge the receipt of your letter of the 20th, and in reply would state that we have agreed to admit all *bona fide* military rifles, of whatever calibre, provided a certificate is shown that they are such rifles as are served out to corps in the U. S. service, either regular or volunteers. This matter was brought before our committee by a letter from Mr. Bruce, of the *Turf, Field and Farm* office, and the committee at once resolved to admit your rifles. If you wish to try the Snider's we will place some at your disposal; but our object in making so many of the matches open, is to test the merits of the different rifles and not only to try the mettle of the men.

Hoping to see a number of the members of the N. R. A. at our meeting, I remain, yours truly,

JOHN FLETCHER.

Lt. Col. H. A. GILDERSLEEVE, Secretary N. R. A., New York.

HANNIBAL, Mo., July 27th, 1874.

EDITOR FOREST AND STREAM:—

The writer or the printer made an error in my article on Shells, published in your issue of the 23d. In place of "Chicago Gun Trial" please read "New York Gun Trial," and for "eight guns" read "six guns."

HERBERT.

Micropterus nigricans.
Sea trout, *Salmo immutatus*.
Weakfish.

—The regular run of Spanish mackerel is off the coast, and the price is from twenty to twenty-five cents a pound. The fish average three pounds. Bigger schools and even primer fish may be expected next week. Bonitos are in large supply, and are much eaten by the poorer classes. There are queer stories about the bonito being poisonous. We fancy if there was any truth in it, half the tenement population of this big city would have been laid out stiff and stark before this. Salmon on the wane, and worth thirty-five to forty cents. Receipts about 10,000 pounds a day, all coming from the Provinces. Salmon trout and white fish from the lakes, worth fifteen cents a pound, are now offered. These fish would be in better demand if it was not for the quantity of sea fish in the market. Blue fish in quantity. Though caught scattering on the coast, they are off Hyannis, Mass., now in big schools, and are selling at from six to eight cents. Striped bass not so very plenty, and worth twenty cents. They are coming from Martha's Vineyard. Halibut in better supply than last week. Cod in abundance from east of Nantucket and the George's, worth eight cents. Large lobsters from New Jersey still come forward.

—This week in the market, Mr. Albert Haley of the lower Fulton Market showed us a fine specimen of the thresher, (*Alopius vulpes*). One can imagine the terrible execution such a fish could make with its tail, and how a whale, jabbed on one side by sword fish and whipped on the other by threshers, would stand but the ghost of a chance. The tail was fully five feet long, fashioned like a harness trace, pliant and supple as the limberest rattan, and in fact absolutely perfect as a weapon of punishment.

—At last shad have been caught with the hook in the Susquehanna River. Last week four were taken at Fites Eddy by Surgeon General Foltz, U. S. A., and Mr. Stemman, editor of the Lancaster (Pa.) *Herald*, and a few days previous one was taken by a Mr. Long. They measured about six inches in length, and were taken by trolling with a worm in quick water among rocks. The river was low and the water clear.

—Salmon fishing in the Provinces of New Brunswick and Canada has not been so excellent, or the fish so large, for many years past, as they have been this season. The United States have been well represented on Canadian rivers.

—We learn from a gentleman who was present, that on the 10th instant, in the St. John river, District of Gaspe, Lady Dufferin, wife of the Governor General, hooked with fly and landed a salmon that weighed twenty-six and a half pounds! We wish some of our American ladies could appreciate the merit of this remarkable feat.

—In the last number of the *Field* a correspondent speaks of the efficacy of prawn as a salmon bait, and mentions cases where the fish, refusing the fly, were caught in quantity with prawn. A curious fact mentioned by the writer, is that the prawn are boiled. The worst of this bait is its delicacy, the broad plates at the head being apt to come off, and leave unsightly white patches. This defect is remedied by making a turn or so with red silk thread round the bait. This bait might be made more frequent use of in this country.

—A useful letter from C. C. Markham, the artist, containing hints to those visiting the Adirondacks, is deferred until our next issue.

—C. F. Orvis, the celebrated rod-maker, of Manchester, Vermont, has sent us a beautiful German silver perforated trout reel, which he is now manufacturing, the most unique we have ever seen, and we might say, equal to any other reel in its various features. In some respects it is altogether unlike other reels, and the improvements which the patent covers are quite marked. It is a narrow reel; its diameter is larger in proportion to its width than is usual, so that it not only winds more rapidly, but it lays the line more evenly than if the spool or cylinder were wider. Its perforation makes it quite light—yet heavy enough to balance the rod comfortably, and also serves to dry the line rapidly by admitting circulation of air. For our own preference we should wish a click, but others would think

differently. It is a pretty toy, as well as a useful implement, and can be carried in a very small space by unshipping the crank. Price \$5, in case. We should think that a salmon reel after this patent would be even more desirable, as metal salmon reels are always ponderous.

—Some idea of the immense fishing business carried on around the island of Newfoundland may be formed from a fact casually mentioned by a correspondent of the *St. Johns North Star*, writing from Fortune Bay, northern district of Newfoundland. Under date of June 29, the correspondent says there were 350 sail of square-rigged vessels in St. Peters roads, besides 300 schooners—a fleet of 650 vessels—all waiting for bait to pursue their business of cod fishing; and this is only one district of the island.

RANGELEY LAKES, MAINE.—The thermometer ranged during the month of July from 83° to 90° in the shade. Black flies are not so thick as in June, but the mosquitoes still make life in the woods uncomfortable without some protection.

A party of three from Connecticut have had good success on Quimby Pond and that vicinity, stopping with a Mr. Quimby, who lives a short distance from the town of Rangeley, who is always happy to entertain sportsmen. They landed with fly in six days about 250 pounds of trout, a great portion of which they packed and brought home in good condition. A party of two, on the 13th and 14th, visited a place called "Stony Battau," on Mooselucmaguntic Lake, and caught twenty six trout weighing about thirty pounds, and also had good luck off Bugle Cove. They were inexperienced, and fished with bait. A fly fisherman could have made a much better record. Same party caught on Rangeley stream next day forty trout averaging over a pound each. Another gentleman on the 15th inst., at the falls of the Kennebec and half a mile above, landed in five hours some fifty-four trout, weighing from three-quarters to one and a half pounds each. The next day this gentleman caught in the same time on the Rangeley stream, seventy-five trout, averaging a pound each, returning to their native element (like a true angler) some two dozen of less than a pound weight, these last are not included in the seventy-five. There has been little or no rain in this region for almost the entire month. The following items of interest have been received from this locality the last week.

"A party of four from Cleveland, Ohio, visited the Cupustuc River, and passing some three miles up the stream caught in five hours two hundred and forty-two trout, weighing from one to two pounds each. They were all taken with eight ounce rods, the fish showing a marked preference for the scarlet ibis, brown hackle, and a fancy fly of a Bismarck color, and the trout were all captured near the second rapids above and below the "jam." The above flies were about equal as regards their killing effect, and seeing their difference of color was so marked, it was rather singular. Thermometer ranges from seventy to eighty degrees in the shade; wind northeast and south; violent rain storm has prevailed for three days past."

—A letter from Marquette, Mich., dated July 25th says: "Our bay is now, and has been all summer, swarming with lake and salmon trout. Every boat in the city is engaged every day by parties of strangers and citizens, ladies and gentlemen, trolling, and with great success. It is not unusual to catch a dozen or more before breakfast, averaging in weight from five to twenty pounds. Mr. Lyon, the landlord of the Northwestern Hotel, hooked one that he estimated weighed at least forty pounds, but it was too much for his tackle and escaped. Our hotels are well filled with both eastern and western people, and most of them are sportsmen. Flies have nearly disappeared and mosquitoes are not numerous."

H. R. M.

W. LONG ISLAND, July 18th, 1874.

EDITOR FOREST AND STREAM:—

Did you ever notice or hear about any other bird but the emu (*emulus canorus*), of the old country laying their eggs into smaller bird's nests? Though naturalist myself, and well acquainted with the natural history of the old country, especially the German fauna, I never did, and so I hereby request your kind information about a fact you will allow me to give the following short account of:

Some days ago I noticed in a group of trees just opposite my window a young bird sitting motionless on a naked branch. It was about the size of a young thrush or blackbird, had a gray, brown-spotted plumage on head, back and wings, and a grayish-white breast. Its beak let me recognize in it a member of the family *Corvirostri*.

Suddenly a very small yellow bird, apparently a kind of *silvia* (called here by its color yellowbird) came flying on the limb bearing in its little beak a living insect, and shoving it into the wide, opened mouth of the big, hungry fellow, who devoured it with as much swiftness as appetite. This feeding was repeated for about five or six times, when an accidental noise from below scared them from the tree and they both disappeared in the bushes. The afternoon of that day I witnessed a recapitulation of the morning performance on the garden fence, and there, or in the before-mentioned tree, I see now every day the little, never tired step-mother flying to and fro and bringing the best flies and bugs she can find to her big, lazy pupil, who, though almost full grown, flying with sufficient ability and well able to eat alone, only very seldom takes pains to do so, but prefers to wait in *dolce far niente* for the good food of its ever ready little nurse.

I should be very thankful to you, sir, if you would tell me in your next number your opinion about this case, and what kind of birds you suppose both are. Very respectfully,

H. DE NEHOSNOVA.

—Our whilom correspondent, F. D., of Cedar Rapids, Iowa, tells us of the kinds of fish found in that State. These are:—"Black bass, rock bass, striped bass or pan fish, pike perch or salmon, catfish, yellow perch, pickerel. White perch run up as high as ten pounds. Of the sucker family, there is the buffalo, back, red horse and sucker." [What admirable names these Westerners have!] "In the spring, in the river, our killing bait for killing black bass is a minnow called here a yellow fin; he generally runs from three to six inches in length by one inch wide. You can tell one from a shiner instantly; he feels rough to the touch, while a shiner is a slippery customer. At this place is a dam eight feet high. The minnows gather in myriads. You can fill a bucket at one haul. The anglers of this place use from twenty five to fifty yards of line, size of hooks, three to five, Limerick or Kirby. A few of us have some imported Carlisle, very rare. It is a common sight to see the little boys going home with a big string of fish, as much as they can lug. The river has been low the greater part of the season."

Ordnance Lands Sale.

TORONTO.

PUBLIC NOTICE is hereby given that on **TUESDAY** the 8th day of September next, at Noon, will be sold at Toronto, by Mr. Orin Wardell, Auctioneer, the annual Leases of the Reserves on Lake Erie, at Pointe Pelee, containing about 4,200 acres, Rondeau, containing about 500 acres, and Turkey Point, containing about 592 acres, respectively, to be employed for the purpose of shooting and fishing, for the proper preservation of the game and the protection of the timber thereon.

These Leases to endure for a term of 21 years each, with power to the Department to resume possession, at any time, on giving one month's notice.

On condition, that the just rights of all squatters and Indians shall be respected, and reserving—"all rights of fishery, or use and occupation of the shores in connection therewith, under authority of the Department of Marine and Fisheries."

The rent to be paid to this Department, semi-annually in advance, and good and sufficient security to be tendered, at the sale, for payment. If insufficient, the sale to be renewed at the time and place of sale.

Further conditions, if considered necessary, will be declared at the time of sale.

Lessees to accept boundaries and quantities as shown on the Ordnance plans.

By Order,
E. A. MEREDITH,
Deputy of the Minister of The Interior.
WILLIAM P. COFFIN,
Commissioner of Ordnance
and Admiralty Lands.
Ottawa, 1st August, 1874.

SUMMER TRAVEL.

The season of business and summer travel has commenced, and we respectfully suggest the propriety of obtaining a General Accident Policy in

"THE TRAVELERS"

of Hartford, the oldest company in America, writing yearly or monthly policies of insurance against general accidents of business or occupation, as well as accidents of travel.

"THE TRAVELERS"

also grants all forms of Life and endowment insurance, and offers peculiar inducements in its sensible all-cash plan, its definite, straight-forward contract, its ample security, its low premiums, and its good management.

JAS. G. BATTERSON, President.
RODNEY DENNIS, Secretary. July 23

Mr. Macdonald's Setters.

GRAND YOUNG WHELPS, OF THE above grand strain, by Macdonald's champion Field winner, "Ranger," out of "Vaynool," own sister to Ranger. Also, whelps by Lord's Laverack dog "Jock," out of Macdonald's "Judy," dam of Ranger, and by Ranger, out of Macdonald's "Thursk." Also whelps by "Ranger," out of Mr. Cunliffe Brooks' champion setter "Jewell" and Mr. Garth's Field winner, "Boss."

Address G. de Landre Macdonald Esq., Hilbre House, West Kirby, Cheshire, England. July 16

PAMRAPO—Lovelier than the Bay of Naples; most magnificent views; the Ocean dimly seen in the distance; the Lighthouse; the Islands dotting the bay, with their beautiful green carpets; ships grandly passing till far out of view; steamers likewise receding from the sight bound foreignward; yachts dancing; the gaily decorated barges of the boat clubs, conspicuous among which are the scarlet of the Tritons, the magenta of the victorious Argonauts, the blue of the Bayonnes, and the no less lively hues of the Claremonts, the Oneddas, and lesser crews. Do you want fishing? Here it is in its excellency. Old Robins' Reef can tell you that around her rocky sides sport all the variety of fish to suit divers tastes, and in prolific supply. Yachts are in two hours loaded with the blue fish that are now so lively trolled for in these waters. Health reigns supreme. The census lately taken shows New Jersey to rank first in the United States. The rate of increase of this county (Hudson) is 15 per cent., in New York less than 2 per cent., Brooklyn only 5 per cent. But twenty-three minutes from Liberty street, and commutation eight cents. Houses and lots for sale for cash, by instalments, or terms to suit. Inquire for JOSEPH HALLOCK, Forest and Stream office, 17 Chatham street.

Orange Sporting Powder.

ORANGE LIGHTNING POWDER,

The strongest and cleanest Powder made. Nos. 1
to 7, packed only in sealed 1 lb. canisters. The coarser
sizes especially are recommended to owners of fine
breech-loading guns, giving great penetration with
very slight recoil.

ORANGE DUCKING POWDER,

For water fowl. Very strong and clean. Nos. 1 to
5. Packed in metal kegs of 64 lbs. each, and in canis-
ters of 1 and 5 lbs.

AUDUBON POWDER,

Very quick. For woodcock and quail Nos. 1 to 4.
Packed in metal kegs of 12 1/2 lbs. and 6 1/2 lbs., and in
pound canisters.

ORANGE RIFLE POWDER,

The best for rifles and for all ordinary purposes.
Sizes F.G., F.F.G., F.F.F.G., the last being the finest and
most used. Packed in wood and metal kegs of 25
lbs., 12 1/2 lbs., and 6 1/2 lbs., and in canisters of 1 lb. and
1/2 pound.

All of the above give high velocities and less resid-
uum than any other brands made.

Cut Cavendish Smoking.

Ask your Dealer, or send direct to our

works for a supply of PURE Tobacco.

VIENNA, AUSTRIA, Nov. 30, 1873.

Messrs. Wm. S. Kimball & Co.:

SIR—A friend of mine sent me, with a transport of Indian Skins, two pounds "Vanity Fair," which I declare to be the best Tobacco I ever smoked. We have very good tobacco in Vienna—Turkish and Hungarian, but "Vanity Fair" is the King of all, by its aromatic flavor and the right sort of strength. My friend in New York got an appointment in California, by that reason I apply immediately to you, begging you to send me for the enclosed ten dollars, a supply of "Vanity Fair," and send with the next steamer to Germany. If there is a German firm that sells your excellent "Vanity Fair," I beg you to enclose me the address.

DESKS,
OFFICE AND LIBRARY FURITURE,
103 Fulton Street, N. Y.
FINE CYLINDER DESKS.

This arm was submitted in competition with over
one hundred different systems, American and Euro-
pean, to the Board of United States Officers, appoint-
ed by Act of Congress, 6th June, 1872, for the pur-
pose of selecting the best arm for the service, and of
which Brig. Gen. A. H. Terry was President. It suc-
cessfully passed through all the tests.

The following is the report of the Board:
"Resolved, That the adoption of magazine guns for
the military service by all nations is only a question
of time; that whenever an arm shall be devised which
shall be as effective as a single breech-loader, as the
best of the existing breech-loading arms, and shall at
the same time possess a safe and easily manipulated
magazine, every consideration of public policy will re-
quire its adoption.

Resolved, further, That the experiments before the
Board with the Ward-Burton Magazine System have
so impressed the Board with the merits of this gun,
that they consider it as more nearly fulfilling the con-
ditions above specified than any other tried by them
or of which they have any knowledge, and it does
recommend that a number of magazine muskets be
made on the plan for further trial in the field." (See
Ordinance Report.)

We are now receiving orders for these guns, and due
notice will be given in this paper when they are ready
for delivery.

The following is our scale of prices: Special Maga-
zine for large game, carrying from 3 to 8 cartridges,
70 to 85 grs. of powder, 350 to 400 grs. of lead, 8 to 10
lbs. weight, from \$60 and upwards, according to finish.
Special Long-range Magazine Rifle for Creedmoor
shooting, 90 grs. of powder, 480 grs. of lead, carrying
3 to 8 cartridges, weighing 10 lbs., from \$100 and up-
ward. Magazine guns for general use, carrying 2 to
9 cartridges, 60 grs. powder, 350 grs. lead from \$40
and upward. Single Breech-Loader, Creedmoor
shooting, for long range, 90 grs. powder; 480 grs. lead,
from \$60 and upward. Single Breech-Loader for
general use, 6 to 7 lbs., 60 grs. powder, 350 grs. lead,
from \$30 and upward. The calibre of all our rifles,
unless otherwise ordered, will be 45-100 in.

All communications should be addressed to

Care Ward & Co., 54 Wall St., N. Y.

W. W. GREENER'S
PATENT TREBLE WEDGE
Fast Breech Loader
Indestructible by Gunpowder.

This gun is specially designed to meet the require-
ments of American sportsmen. It will stand a larger
charge of powder, and shoot stronger than any other
system. For duck and pigeon shooting these guns
stand unrivalled. The action is simple in construc-
tion, quick and easy to load. They may be inspected
this season at all the principle gun stores in the Uni-
ted States. Prices moderate.

The second edition of "Modern Breech Loaders,
Sporting and Military," will be shortly published by
W. W. GREENER,
July 2 St. Mary's Works, Birmingham, England.
